or Turkish of Constantinople is the most prominent, occupy an immense area, extending from the Lena and the Polar Sea to the Adriatic. They are extremely rich in grammatical forms, especially in the conjugation of the verb. The most important members of the Finnic class are the Finnic of the Baltic coasts (see FINNS), and the Hungarian language, or Magyar (see HUNGARY). These dialects have also a fully developed grammatical structure, and in point of declension are even richer than the Turkic.

The Southern division comprises, among others, the *Tamulic* or Dravidian dialects of Southern India (see TAMIL); the *Gangetic* group, divided into two branches, the Trans-Himalayan (Tibetan, q. v.) and Sub-Himalayan (Bhotanese, &c.); the *Taic*, or the dialects of Siam; and the *Malaic*, or Malay and Polynesian dialects. The Turanian languages do not present the same unmistakable family likeness, the same clear evidences of genealogical relationship, as are presented by the Aryan and Semitic groups. The nature of their structure, and the nomadic character of the peoples speaking them, are sufficient to account for their exceeding diversity, even supposing them to have all sprung from the same original stock. 'The only characteristic Turanian feature which always remains is this: the root is never obscured. Besides this, the determining or modifying syllables are generally placed at the end, and the vowels do not become so absolutely fixed for each syllable as in Sanscrit and Hebrew. On the contrary, there is what is called the Law of Harmony, according to which the vowels of each word may be changed and modulated so as to harmonise with the key-note struck by its chief vowel. The vowels in Turkish, for instance, are divided into two classes, *sharp* and *flat*. If a verb contains a sharp vowel in its radical portion, the vowels of the terminations are all sharp; while the same terminations, if following a root with a flat vowel, modulate their own vowels into the flat key. Thus we have *sev-mek*, to love, but *bak-mak*, to regard, *mek* or *mak* being the termination of the infinitive. Thus, we say, *so-ler*, the houses, but *at-lar*, the horses, *ler* or *lar* being the termination of the plural.'—Max Müller's *Science of Language*, 1st series.

TU'RBARY, in the Law of England, is a right to go upon the soil of another and dig turf, and carry away the same. It is classed under the head of a *Profit à Prendre*, and is generally traced to some ancient custom of a manor, or is proved by prescription, or long use for thirty years and upwards.

TU'RBINE. See WATER-POWER.

TURBI'NIDÆ, a family of gasteropodous molluscs, having a spiral shell, with a narrow entire aperture. The species are numerous; some of them are found on the British coasts. They are numerous and widely distributed. Some are large, others small; some are very beautiful. The beautiful pheasant-shells (*Phasianella*) of the South Seas are referred to this family.

TU'RBOT (*Rhombus maximus*), a fish of the family *Pleuronectidæ*, or Flat-fishes, the most valuable of them all. The genus *Rhombus* has the body rhomboidal; the dorsal fin commencing immediately above the upper lip, and extending almost to the tail-fin; the eyes generally on the left side. The Brill (q. v.) belongs to it as well as the T., and some other less important fishes. The T. attains a large size, sometimes 70—90 lbs. weight. Its form is shorter, broader, and deeper than that of almost any other flat-fish. It is of a brown colour on the upper surface, which is studded with hard roundish tubercles. Like the other flat-fishes, it generally keeps close to the bottom of the sea; and it is found chiefly on banks where there is a considerable depth of water. Some of the banks in the German Ocean abound in T.—as the Dogger Bank —and yield great quantities to the London market. The T., however, is also found, although more sparingly, in estuaries. In former times, it was chiefly caught by long lines; but of late, the greater part of the supply for the London market is obtained by beam-trawling (see TRAWLING). Few kinds of fish are more prized for the table than the turbot.—The AMERICAN or SPOTTED T. (*Rhombus maculatus*) is also highly esteemed for the table. It is common on the coasts of New England and New York. It attains a weight of 20 lbs. The breadth is about one-half of the length. The upper surface is smooth, reddish gray, with large circular or oblong darker blotches, and numerous white spots.

TURDI'DÆ. See MERULIDÆ.

TURENNE, HENRI DE LA TOUR D'AUVERGNE, VICOMTE DE, one of the most eminent of France's military heroes, was the second son of Henri, Duke of Bouillon, and Elizabeth of Nassau, the daughter of William I. of Nassau-Orange. the great assertor of the liberties of the Netherlands, and was born at Sedan, in the dep. of Ardennes, 11th September 1611. Brought up in the Reformed faith, he was sent, on the death of his father in 1623, to Holland, where, under his uncle, the celebrated Maurice (q. v.), he was initiated into the art of war. Returning to France in 1630, he was favourably received by Richelieu, who at once gave him a commission. In 1637, he was attached to the army of Bernard of Weimar, which at that time was engaged in Lorraine; and by bringing about the capture of Landrecies, Maubeuge, and other places, including the key of Western Germany, Brisach, gained such repute, that on his return to Paris (1638), he experienced quite a triumphal reception. The victories of Route and Casale in the Italian campaign of the following year, added to his laurels; and in 1641 he was for the first time intrusted with the supreme command. The rapid and thorough conquest of Roussillon from the Spaniards in 1642, was good proof of his masterly military genius, and was rewarded in 1643 with the baton of a marshal of France, and the chief command on the Rhine, where repeated reverses, a defective commissariat, and want of pay, had completely demoralised the army. But through a liberal expenditure of his own funds, and of loans obtained by him on his own security, the troops were speedily re-equipped; and by a victory over the Bavarians at Rottweil (1644), their *morale* was restored. Condé's arrival transferred him to a subordinate position; and his restoration to supreme command was followed by the commission of a glaring strategic error for which he was severely punished by his able and watchful opponent, Mercy, who completely routed him at Marienthal, 5th May 1645; but on August 3 of the same year, this disgrace was amply avenged by Condé at Nordlingen, where Mercy was slain; and T. gloriously concluded the war on the part of France by the reconquest of the Treves electorate, by the conquest of Bavaria in conjunction with the Swedes, and by a successful campaign in Flanders. In the civil wars of the Fronde (q. v.), which immediately followed, T. joined the party of the *frondeurs*, of whom his elder brother was one of the principal leaders; but after being defeated at Rethel (December 15, 1650), he withdrew to Flanders, returning on Mazarin's retirement. On the minister's return, T. joined his party, while Condé deserted to the *frondeurs*, and the two greatest generals of the period were for the first time pitted against each

other. T. was uniformly victorious over his former chief, though his forces were inferior in number; and ultimately forced him to retire from France: after which he subdued the revolted cities, crossed the northern frontier, and conquered much of the Spanish Netherlands. In 1667, on the outbreak of war between France and Holland, Louis XIV. created T. Marshal-general of France, and would have made him Constable, had he not been a Protestant. Indeed, the unorthodoxy of T. had for some time been a matter of grave concern to the bigoted young monarch, at whose suggestion Bossuet attempted the veteran's conversion by composing his celebrated *Exposition de la Doctrine Chrétienne*, which, backed by the king's repeated solicitations and remonstrances, and doubtless, as Voltaire suggests, by the more efficacious promptings of ambition, had ultimately the desired effect. T.'s campaign in Holland, in which he was nominally under Louis's command, was a most triumphant one; and the Elector of Brandenburg, who had ventured to side with the Dutch, was pursued to Berlin (1672), and forced to beg for peace. The emperor next took up arms on behalf of Holland, whereupon T. was transferred to the Upper Rhine. This, his last campaign, is foully disfigured by the horrible devastation of the Palatinate, executed under express orders, doubtless, but with a willing thoroughness which is utterly unjustifiable. After routing the Germans at Mulhausen and Turckheim, and forcing them across the Rhine, he was at last opposed to a worthy antagonist in Montecuculi (q. v.); but, unfortunately, their famous passage of strategy of nearly half a year's duration was left unfinished, T. being killed while reconnoitring the ground at Salzbach, with a view to a grand engagement. His grateful sovereign, to shew that he made no distinction *entre porter le sceptre, et le bien soutenir*, ordered him to be entombed at Saint Denis, and funeral orations were pronounced for him by Flechier and Mascaron. On the desecration of Saint Denis during the Revolution, T.'s monument suffered with the rest, and was ultimately placed by Napoleon under the dome of the Invalides. T. has left Memoirs of his campaigns from 1643 to 1658, which are of considerable interest to the student of history. Many biographies of this eminent warrior have been written, by Raguenet, Ramsay, Buisson, D'Avrigny, &c.

TURF LAWS. The laws concerning the ancient pastime of horse-racing are subdivided into those affecting races, wagers, and betting-houses, for which last, see BETTING. 1. As to racing, it has sometimes been popularly believed that the public have a right to trespass on lands to attend or to hold races; but no such right exists. Hence the stewards or persons intrusted with the management and possession of the land for the time have a right, which is seldom enforced, to turn off any person they please from the grounds. A sweepstakes is a stake or fund, for which at least three entrances must be made, and the whole stake becomes, under certain regulations, the property of the winner. Many of the great races are not run within a year from the time the horses are entered. The owner of a horse entered can withdraw or 'scratch' him before the race is run. When the race is run, the successful party may sue for the amount of the stakes; and if the race is not run, or cannot be run, each subscriber may sue for recovery of his contribution; but no one can obtain his contribution, or countermand it, till the event has happened, for a sweepstakes is a legal contract to abide the result. If the stakes are contributed for an illegal game, it is otherwise; and before the stakes have been paid away, any contributor may sue for and recover his deposit; but he ought also formally to demand it back. The stewards are the proper parties to decide all disputes about the fairness of a race, and their award is binding: if they cannot agree, then it will fall to be decided by a jury. It is no legal objection to their award, that one of them is interested in the decision, for this is considered partly unavoidable, and within the knowledge of all parties as a probable event. If there are three stewards, the decision of the majority is binding.—2. As to wagers. It was not illegal at common law to enter into a wager, if the subject-matter was not injurious to morality or decency; and hence the bet could be recovered by action, and betting on a race is still legal to any extent. But by the act 8 and 9 Vict. c. 109, s. 15, all wagers were declared void, except as regards subscriptions of money or plate to be awarded to the winner of a lawful game, sport, pastime, or exercise. If one makes a wager on a race, he may retract it any time before the event comes off, and require the money, if deposited, to be repaid; and no wager can be tried in any court of law or equity, so that the winner cannot compel payment. It is merely a debt of honour.

TURGOT, ANNE ROBERT JACQUES, French statesman, born in Paris, May 10, 1727, was descended from one of the oldest families in Normandy. T. was destined for an ecclesiastical career, but adopted by preference the profession of law. In 1761, he was appointed Intendant of Limoges, and administered the affairs of the province for thirteen years. He introduced a more equitable administration of imposts, and succeeded in abolishing the old method of repairing roads and bridges by the compulsory labour of the poor inhabitants of the district, called *corvées*. He also exerted himself in providing for the subsistence of the people and the protection of commerce. He introduced into the Limoges the cultivation of potatoes. A wider field opened before him on the death of Louis XV. The finances were in a terrible state of disorder, the whole social and political system of France needed regeneration and reform; and T. appeared to be the man to meet the crisis. He was first made Minister of Marine, and afterwards Comptroller-general of France, when to fill that post was to be virtually the Prime Minister. In his letter to Louis XVI., he adopted, as the principle of his administration, that there should be 'no bankruptcy, no augmentation of imposts, no loans;' yet he foresaw that the strength of the privileged classes, and the corrupt influence of those who profited by abuses, would be too much for him, and that against such enemies he could hardly hope to retain the confidence of the king. His first task was so far to reduce the expenditure as to leave a surplus of 20 millions of francs a year, to be applied to the liquidation of old debts. He augmented the public revenue without imposing new taxes, and he introduced exactness of payments and fidelity of engagements into all his financial operations. One of his first measures was the carrying-out of free-trade in corn throughout the interior of the kingdom. He constantly occupied himself with the amelioration of the condition of the people. He proposed to enfranchise the rural districts from statute labour, provinces from their barriers, commerce from internal duties, trade from its shackles, and, lastly, to make the nobility and clergy contribute to the taxes in the same proportion as the third estate. This great minister and virtuous citizen, of whom his colleague, Malesherbes, said: 'He has the head of Bacon, and the heart of L'Hopital,' wished, by means of provincial assemblies, to accustom the nation to public life, and prepare it for the restoration of the States-general.

If the nobility and privileged classes had possessed enough of foresight and patriotism to submit to his plans for reforming France, she might have been spared the horrors and excesses of the Revolution. But his projects for the public good were defeated by the confederacy formed against him by nobles, courtiers, farmers of the revenue, and financiers. The king forsook him, although, at the same time, observing that T. and himself were the only persons who desired the welfare of the people. He retired, having held office for only twenty months. It is alleged against his practical talent for statesmanship, that he laboured under a want of address, and that he did not sufficiently dissemble his hatred and contempt for the cowardice and baseness of those who fattened upon the abuses that were eating like an ulcer into the heart of France. After his retirement, he resumed his early worship of the Muses. His Latin inscription for the portrait of Franklin is a line of which any author might be proud: 'Eripuit cœlo fulmen, sceptrumque tyrannis.' He also devoted himself to physics and mathematics. His works are a mine of sound and original thought. His *Mémoire* on the American war expresses views on the nature of colonies which have since been adopted by the best writers. His work on *Usury* contains almost all that is of value in Bentham's *Letters on the Usury Laws.* He held general objections to charitable institutions. He died of gout, March 20, 1781, leaving behind him a memory which France will ever cherish with veneration.

TURIN (*Augusta Taurinorum*, *Bodincomagus*), *Colonia Julia*, *Taurasia*—in Italian, *Torino*), a city of Northern Italy, formerly capital of Piedmont, then of the kingdom of Italy, is situated near the confluence of the Po and the Dora Riparia, 45° 5′ N. lat., 7° 42′ E. long. Its pop. at the beginning of this century was 42,000—in 1863, it was 235,000; after the capital was removed to Florence, it was reduced to 204,800. It began to acquire importance when Amadeus V. declared it the capital of Savoy in 1418, built a castle there, and made it his residence. In 1620, Charles Emanuel I. enlarged the city by royal decree: it was still more enlarged in 1673 and in 1702. At the beginning of this century, the French destroyed and levelled the ramparts of the town, converting them into public promenades. Of late years, the moats and fortifications have been demolished, to make way for new streets towards Porta-Susa. In consequence of these improvements, T. has become one of the handsomest cities in Europe. It is famed for its handsome squares. Some of the finest are—Piazza San Carlo, surrounded by wide porticoes, and adorned by a fine equestrian statue of Emanuel Philibert of Savoy, by Marochetti; Piazza Castello, also surrounded by porticoes, which are prolonged down Via Po to the end of Piazza Vittorio Emanuele, the finest square in Europe for size, regularity of architecture, and beauty of situation; Piazza Carlo Felice, with porticoes and a fine garden; Piazza Carlo Alberto, with an equestrian statue of the king of that name by Marochetti; Piazza d'Armi, a vast open space for military exercises, flanked by the old and new arsenals of the kingdom. Leading out of Piazza Vittorio Emanuele, there is a handsome five-arched bridge across the Po, begun by Napoleon I., with money got by the sale of the jewels and votive offerings of the cathedral, and finished by the kings of Sardinia. Another fine bridge is that across the Dora, of one single arch, nearly straight, the work of the engineer Mosca. Among the numerous churches, the principal are the cathedral of San Giovanni, a Gothic structure, built in the 7th c., and reconstructed in 1498; San Filippo, the handsomest church in T.; La Consolata; La Gran Madre di Dio; and a Waldensian temple. On the summit of a hill near the town is La Superga, a splendid Basilica, raised by Victor Amadeus to fulfil a vow, and now the mausoleum of the House of Savoy. Among the 'palaces,' must be noticed the royal palace, designed by Castellamonte, which is poor in outward appearance; the Carignano Palace, an odd building, by Guarini; the town-hall, designed by Lanfranchi; the university, with 71 professorships and 888 students (1865), a library of 120,000 vols., and 2000 MSS.; the Accademia delle Scienze, with an Egyptian museum, the finest in Europe; the Seminary; the Hospital of San Giovanni. The private palaces are numerous and vast, but in a bad style of architecture. There is the Theatre Royal; the Carignano Theatre, designed by Alfieri; the Vittorio Emanuele, and many other theatres.

The manufactures of T. consist of woollen and silk fabrics, velvet hats, paper, pottery, leather, arms, and liqueurs. The population is sober, industrious, and generally well off.

T. was originally inhabited by the Taurinians, a tribe of Ligurians. It is first mentioned in history in the time of Hannibal, by whom it was taken and sacked, on his descent into Italy after crossing the Alps. T. became a royal colony, 166 B.C., and was called by Augustus, *Augusta Taurinorum.* On the fall of the Empire, it went to the Lombards, and became the capital of one of the 30 Lombard duchies. Charlemagne made it the residence of the Duke of Susa, whose line ruled till 1032, when the House of Savoy succeeded it. It was taken by the French in 1506, and held by them for nearly 60 years. They again took it in 1640; and in 1796, it was dismantled, and united to the French Empire in 1800 with the name of the department of the Po. In 1815, it was restored to the House of Savoy.

TURKESTA'N, 'the country of the Turks,' called also *Jagatai*, and by the Persians *Turan*, is an extensive region of Central Asia, stretching from the Caspian Sea eastward to beyond Lob-nor (long. 110° E.), and from Siberia and Dzungaria southwards to Persia, Afghanistan, and Tibet. Until quite recently it was supposed that the Bolor Tagh (q. v.), a mountain chain of the first magnitude running north and south, divided it into two parts. English explorers entering T. from the south and Russians from the north have shown this idea to be erroneous, but a lofty table-land, the Pamir Steppe, sloping gently towards the east and west, separates the rivers running eastward to the desert of Gobi from those which run to the sea of Aral, and separates T. into an eastern and western portion.

WESTERN TURKESTAN, *Great Bukharia*, or simply *Turkestan* or *Turan*, consists of the great hollow plain of the Caspian and Aral Seas, which occupies its west and centre, and of the hilly and well-watered districts formed by the western ramifications of the Thian-shan Mountains and the Hindu Kush. The plain is composed of deserts of loose shifting sand, interspersed with oases where a subsoil of clay renders the formation of lakelets of rain possible, strips of fertile land along the banks of rivers, and occasional tracts clad with coarse thin grass; the eastern districts abound in valleys of remarkable fertility. The climate varies on the plains from extreme cold to burning heat, and though, in the eastern high lands, the cold is almost as intense in winter, the heat of summer is much less. The rivers of T. are the Sir-Daria (see JAXARTES) and Amu Daria (see OXUS), the Zer-Afshan, which rises on the south of the Asfera tag (a prolongation of the Thian-shan range), and flows westward for 400 miles, terminating in a small salt

lake or marsh near Bokhara; and the Murghab, which rises in the mountains of Ghur, and after a west-north-west course of 450 miles, loses itself in a marsh beyond Merv. The vegetable products of the country are fruits, grain, cotton, flax, hemp, and tobacco. Silk is also produced in considerable amount. Forests can hardly be said to be at all represented in this extensive region. Salt is abundant, large tracts of desert being strongly impregnated and even crusted over with it; and sal ammoniac is common. Agriculture, and the breeding of the domestic animals, are the occupations of the great mass of the population; but manufacturing industry is also considerable. The produce consists of cotton, silk, linen, and woollen goods, shagreen (superior to that manufactured in Europe) and other kinds of leather, paper made of raw silk, carpets, and a few sabres, knives, and rifles.

T. is divided into various states, viz., Khiva (q. v.) on the west; Bokhara (q. v.) in the centre; Khokan (q. v.) in the north-east; Kunduz or Badakshan (q. v.) on the south-east; Russian Turkestan on the north; Eastern Turkestan, recently taken from the Chinese, on the extreme east; and Kafiristan (q. v.), a small outlying state, separated from the others by the mighty range of the Hindu Kush. Russian Turkestan, Khokan, and Bokhara are subject to Russia. Of these, Khokan is the largest, most fertile, and most populous, notwithstanding Bokhara and Khiva have repeatedly proved themselves to be more powerful and warlike. In the north are the steppes of the Kirghis, who in Khiva acknowledge the authority of the Turkish khans; in the south are numerous independent predatory hordes of Turkomans, and several fortified cities of the Turkomans, as Andekhuy (pop. 15,000, mostly Turkomans, with a few Uzbeks and Tajiks), Maymene (pop. of city and ten dependent villages, 100,000, mostly Uzbeks), Khulum, Balkh, Akshi, Siripûl, and Shiborghan, all of which, with the exception of Maymene, are generally subject to one or other of the princes of Afghanistan, and raise a revenue by taxes on passing caravans. The inhabitants of T. are of various races—Uzbeks (q. v.), the dominant race, T komans, Karakalpaks, Kirghis (q. v.), Sarts or Tajiks, Persians, Kiptchaks, and a few Arabs, Hindus, and Jews. Of these, the Sarts or Tajiks, the original inhabitants of the cities, are of ancient Persian stock, and along with the Uzbeks, Hindus, and Jews, form the settled population; the Persians are either slaves, or, being introduced into T. as such, have obtained their freedom, and settled in the country; the other races are mostly nomad and predatory. The prevalent religion is Mohammedanism, and most of the tribes are Sunnites. A few Sheeahs, Sufis, and Buddhists are also found. One remarkable feature of the governments of Central Asia is their extreme jealousy of foreigners, which renders the country almost inaccessible to European travellers; and of the few daring spirits who have ventured into it, the greater number, as Conolly, Stoddart, Moorcroft, Guthrie, and Schlagintweit, never returned.

T. has played an important part in Asiatic history from the very earliest times. The contests between the Iranian and Turanian races occupy a prominent place in Firdusi's sketch of the semi-mythical traditions of Persia; and the earliest light of history shews us Bactriana (Balkh) and Sogdiana (Bokhara) as well cultivated and populous countries, generally attached to the Persian Empire, and colonised by Persians, to whom most of the prominent cities of T. owe their origin. With Persia, T. passed into the hands of the Macedonians, who made Bactria an independent Greek kingdom, while the rest was in possession of the Parthians. Under the Sassanides, the Persian boundary was again advanced to the Jaxartes; but the gradual gathering of Turkish tribes from the north-east on the right bank of that river, led to a constant state of warfare on the frontier, which ultimately resulted in the occupation of *Mawer-ul-neher* ('the country between the rivers'—i. e., the Oxus and Jaxartes) and of Khaurezm (Khiva) by the invaders. In the 8th c. of the Christian era, the Arabs possessed themselves of T., and during the decline of the califate, it became the seat of various minor dynasties, as the Samani (q. v.) in Mawer-ul-neher, and the shahs of Khaurezm; and after a brief union with the Seljuk empire in Persia, was mostly united to Khaurezm, and along with it overrun by the Mongol hordes under Genghis Khan (q. v.), on whose death it became one of the four divisions of his vast empire, and was allotted to his son Jagatai. On the decline of Jagatai's dynasty, Timûr (q. v.) rose to supreme authority in T., and in the course of a 35 years' reign, made it the centre of an immense empire, which stretched from the Hellespont to the frontiers of China, and from Moscow to the Ganges. This period was the golden age of T.; its powerful monarch was never weary of adorning its cities with the spoils of victory; colonies of learned men, skilled artisans, and all whose knowledge or abilities could be of service to his subjects, were either transferred to T. from the countries he had conquered, or induced by the most munificent offers to settle there; till under him and his more immediate successors, Samarkand became a focus of enlightenment and learning. But after the death of Shah Rokh, Timûr's youngest son, the empire was split up into numerous fragments; and after a time a new dynasty snatched Persia from Timûr's family, while the Uzbeks, under Sheibani Khan, drove them (1500) from the country north of the Amu-Daria; one of the expelled princes, Mirza Baber, who had ruled in Ferghana (the south half of Khokan), subsequently founding the 'Great Mogul' empire in Hindustan. The Uzbek empire generally included Badakshan, Herat, and Meshed; but these were lost on its division, in 1658, into various independent khanates. Khiva was conquered by Nadir Shah in 1740, and Bokhara limited to the north bank of the Amu-Daria; but the Kirghis of the Little Horde restored the independence of Khiva, which they ruled till 1792, when the present Uzbek dynasty obtained the throne; and Shah Murad (1806—1822), celebrated under the appellation of *Beggee Jan*, effectually re-established its former extensive sway to the Bokhariot sceptre. Khakan, after emancipating itself from the authority of Sheibani's successors, was incorporated with Bokhara; but afterwards united with the states of Eastern T.; and on their conquest by China, resumed its independence. The recent history of T. presents only a series of wars between Bokhara and Khokan, and Bokhara and Khiva, in which the Bokhariots had generally the advantage, owing to the aid of the Turkomans of the southern desert, whom they subsidise; the raids of the Turkomans along the northern frontier of Persia; the advance of the Afghans from the south-east; and the progress of Russian conquest from the north and west.

To explain the Turkoman raids a few additional words on the geography of T. are necessary. Between the deserts of T. and those of Persia lies a long and fertile tract running from the south-east of the Caspian to Herat, the 'key to India;' over it pass the great routes from Western to Eastern Asia. North of it, chiefly in the deserts, dwell the Turkomans, a population of one million of savage brigands and man-stealers, constantly engaged in marauding expeditions against the Northern Persians. They have desolated the frontier, and the atrocities they commit far exceed anything recorded of the African slave-trade. In 1860, Hanza Mirza, an uncle of the present

shah, marched against them, but was defeated in attempting to capture their intrenchments in a marsh. On that occasion 15,000 Persians and 30 guns were taken by the Turkomans. In 1865, a more successful expedition proceeded against Saraks, and the guns were recovered. Still the northern routes are in the hands of the Turkomans, more especially that leading by the Daman-i-koh Hills; and so late as 1872 reports appeared of Turkoman raids in Northern Persia. The south-eastern part of T. has also been the scene of recent strife. The Afghans have invaded it for the recovery of possessions they claimed north of the Hindu-Kush. In 1850, they took Balkh and Khulm, and in 1859, Kunduz, Badakshan at the same time submitting to pay a large tribute. The English and Russian governments seem now to recognise the claim of the Afghans to fix their frontier at the Oxus.

The Russians bid fair soon to absorb all that remains of independent Turkestan. In 1864, they annexed Khokan, the largest and most fertile of the khanates. A struggle followed with Bokhara. On the 20th of May, 1866, was fought the battle of Irjar, the most important event in the recent history of Turkestan. The emir had to flee for his life, leaving his camp in the hands of the enemy. In 1868, the Russians, 8000 men, again advanced and crossed the river of Samarkand. The troops of the emir, 40,000 men, took to flight when they saw the Russians approach with their dreaded artillery, and on 14th of June a treaty was concluded, by which Bokhara transferred to Russia Samarkand and all the territory north and east of it. Khiva still remained independent in the midst of its deserts. On the shores of the Caspian the Russians had established military posts commanding the eastern routes into Turkestan. From these, and from the north and north-east, an expedition in four divisions set out early in 1873 against Khiva. In June news was received in England of the fall of Khiva, which had taken place after no great resistance. The news was welcomed as that of a triumph of civilisation against barbarism; but it is dreaded that Russia will annex the countries now in the hands of the Turkomans, including the northern route to Herat, and prepare for further conquests, threatening alike the commerce and influence of other nations in the East. See *A Journey to the Source of the Oxus*, by J. Wood, with an essay on the *Valley of the Oxus*, by Col. H. Yule (London, 1872); *History of Bokhara*, by A. Vambery (Lond., 1873); article on *Central Asia*, Quarterly Review, April, 1873; and *Ocean Highways*, April, 1873.

EASTERN TURKESTAN, known also as *Upper Tartary*, *Chinese Turkestan*, *Little Bukharia*, and *Tûrfan*, is bounded on the north by the Thian-shan Mountains, on the west by the Pamir table-land, and on the south by the highlands of Tibet or Cashmere. Towards the east it sinks to the desert plains of the Gobi, round the western bay of which it forms a vast crescent-shaped oasis from 4000 to 5000 feet in elevation, drained by the tributaries of the Tarim. This river flows eastward into the desert, and empties itself in the Lob-nor, after a course of 1500 miles. Eastern T. formed till recently a province of China, and its inaccessible position prevented us from obtaining much information concerning it.

Mr Robert Shaw was the first Englishman who entered the country, and from his enthusiastic account of its capabilities as a field for English commerce, it has recently attracted much attention. It is dependent for its fertility on irrigation. The canals ramify over the whole country, sometimes crossing each other at three levels. The plains are covered with cornfields and orchards. So numerous are the latter that, at the distance of a few hundred yards, the whole country seems covered with a wood. In all directions are villages and towns where weekly markets are held, and there are several cities with upwards of 100,000 inhabitants. The political capital is Kashgar; the commercial capital, Yarkand. In the latter there are 60 colleges, with endowments for the education of students in Mussulman law. There is security for life and property, and commerce is protected and encouraged. There is a great demand for English goods and for the teas produced in India, which, it is believed, can be supplied more cheaply from our own frontier than from that of Russia. Mr Shaw, in a letter which appeared in the *Times* of the 25th of January, 1873, showed that there is no difficulty about a return trade as the gold-fields of Khoten are productive, and the whole country produces silk in abundance.

The inhabitants speak Turkish, but are said to be of Persian descent. Little is known of Eastern T. previous to its conquest by Genghis Khan, but after the decay of his empire into petty states, among which are Kashgar, Yarkand, Aksu, and Khoten, the chiefs of these were constantly quarrelling with each other—a temporary peace being occasionally produced by their subjection to some powerful neighbour—till several of the leaders, with the Yarkand prince at their head, invited the Chinese to take possession of the country, which they did in 1758, and it then became one of the great divisions of the Chinese empire. In 1864, however, a mutiny occurred among the Chinese troops, and advantage was taken of it by the family of the Tooras, dispossessed native chiefs, to stir up a Mohammedan insurrection. In it the lead was taken by Yakoob Beg, a Tajik of Khokan; and when the Chinese were overpowered, he assumed supreme power under the name of Atalik Ghazi. He united the whole country between the mountains and the desert into one state, has shown great anxiety to promote trade with India, and in 1872 despatched a mission to Calcutta, where a return mission, under Mr D. Forsyth, was appointed to leave Simla in July 1873. An envoy was also despatched in 1873 to Constantinople, to the sultan, whom the Atalik recognizes as the representative of the califs and commander of the faithful. See *Journey to High Tartary, Yarkand, and Kashgar*, by R. B. Shaw, 1871; and *Despatches and Memoranda as to Trade of Eastern Turkestan* (*Blue Book*, printed in 1869).

TURKEY, or the OTTOMAN EMPIRE (q. v.), called by the Turks *Osmanli-Vilayeti*, includes large portions of the continents of Europe, Asia, and Africa, and consists of Turkey Proper, which is under the direct rule of the sultan, and of numerous dependent and tributary states, governed by their own princes. Turkey Proper is partly in Europe and partly in Asia, and is divided into a number of provinces or *eyalets*. The following table exhibits these divisions as they existed prior to the Russo-Turkish war of 1877—78, which resulted in extensive changes, for particulars of which see the article OTTOMAN EMPIRE.

Eyalets.	Area in Eng. Sq. Miles.	Pop. as estimated (1867).
IN EUROPE—		
Immediate Possessions:		
Constantinople, } Vilayet of Edirné, }	9,450	1,800,000
Vilayet of Danube,	38,619	3,000,000
Vilayet of Bosna,	22,260	1,100,000
Perzerim, } Eyalet of Rumili, } Eyalet of Tirkhala, }	18,711	1,200,000
Eyalet of Janina,	16,170 }	2,700,000
Eyalet of Selanik,	12,075 }	
Isles of the Mediterranean, } Sissan, }	11,781	500,000
Ghirit,	3,276	210,000
Protectorates:		
Roumania,	46,137	4,424,961
Servia,	16,611	1,306,694
Montenegro,	1,680	100,000
Total in Europe,	196,770	16,341,655

Eyalets.	Area in Eng. Sq. Miles.	Pop. as estimated (1867).
IN ASIA—		
Eyalets of Khodavendighiar, Ismir, Koniah, Angora, Kastamuni, Sivas, Trebizond	205,401	10,907,000
Ismit,	3,633	
Vilayet of Erzerum,	119,553	1,906,000
Eyalets of Kurdistan and Karpout,		
Vilayets of Aled and Souria,		
Lebanon,	144,333	2,750,000
Eyalet of Bagdad,		
Eyalet of Hedjaz,	191,352	900,000
Eyalet of Yemen,		
Total in Asia,	664,272	16,463,000
IN AFRICA—		
Tripoli	340,200	750,000
Misr (Egypt)	651,000	8,000.000
Tunis	45,150	2,000,000
Total in Africa,	1,036,350	10,750,000
SUMMARY.		
Eyalets in Europe,	132,342	10,510,000
Protectorates in Europe,	64,428	5,831,655
Possessions in Asia,	664,272	16,463,000
" " Africa,	1,036,350	10,750,000
Grand Total,	1,897,392	43,554,655

As before intimated, the foregoing statistics must be regarded as only approximately correct, since the area and population of T. are known only by estimates, and not as the result of exact measurement and a general census.

The states dependent upon T. are either subject to hereditary chiefs—as in Egypt, Servia, and Montenegro—to elective rulers, or to viceroys appointed by the sultan; and these chiefs, of whatever sort, must, on their accession, be approved of by the sultan, must acknowledge his suzerainty, and pay tribute; in all other respects, they are on the footing of independent rulers.

Land is held in T. under four different forms of tenure—namely, as Miri, or crown-lands; as 'Vacouf,' or pious foundations; as 'Malikaneh,' or crown-grants; and as 'Mulkh,' or freehold property. Property of the first description is held direct from the crown. On payment of certain fees, the government grants the right to cultivate an unoccupied tract of land, over which, however, the sultan continues to exercise the right of seigniory. The second form of tenure, the object of which is to provide for religion and education by the erection of mosques and schools, is of two kinds: 'Vacouf-el-Zaräi,' which is land or other immovable property originally obtained by grants from the crown, and entailed on the eldest surviving member of the holder's family; and 'Vacouf-el-Karamäin,' property bequeathed for pious purposes by private individuals. Since all 'vacouf' property is exempt from taxation, a great loss is caused to the treasury. The 'malikaneh' was originally granted to the old feudal troops; it is hereditary, and exempt from tithes. The 'mulkh,' or freehold property, which the peasants are allowed to purchase from the government on very moderate terms is the most advantageous to the occupiers, but does not exist to a great extent.

Turkey Proper, as the immediate possessions of the sultan are called, is bounded by the Austrian dominions, Roumania, and the Black Sea on the N.; by Persia, the Persian Gulf, and the Arabian Desert on the E.; and by the Red Sea and its outlet, Egypt, the Mediterranean, Greece, the Adriatic Sea, and the Austrian Empire on the S. and W.

TURKEY IN EUROPE, the smaller of the two divisions of Turkey Proper, is generally hilly and undulating, traversed by a mountain system which has its origin in the Alps, whose eastern extension, the Julian Alps, enters the country at its north-west corner, runs in a south-west direction as the Dinaric Alps, keeping parallel to the coast-line, and after entering Albania (q. v.), where it becomes Mount Pindus, assumes an almost southern direction till it reaches the Greek frontier. This range, which forms the watershed between the Adriatic and Ægean Seas, has its culminating point in Mount Dinara (7458 feet), and sends out numerous offshoots over Montenegro and Albania. Its great eastern offshoot is Mount Hæmus, or the Balkan range, which branches off in the north-east of Albania, and runs almost due east to the Black Sea, where it terminates in a bold promontory; this range, which forms the southern boundary of the Danube basin, sends a branch northwards through the east of Servia; two others, the Despoto Dagh and the Little Balkan, south-eastwards through Rumili; and numerous smaller branches over Macedonia. The great river of Turkey is the Danube (q. v.), which, with its tributary, the Save, forms the northern boundary, and receives in Turkey the Bosna and Drin from Bosnia, the Morava from Servia, and the Isker and Osma from Bulgaria. The Maritza (q. v.), whose basin is formed by the Great Balkan and its two south-eastern branches, and the Strumo and Vardar in Macedonia, are also considerable rivers; but those which are situated to the west of the Dinaric-Pindus range, are, from the proximity of that watershed to the sea-coast, insignificant in size; chief of them are the Narenta, Drin, and Voyutza. The primitive rocks predominate in Macedonia; the secondary group in the western provinces and to the north of the Balkan; and tertiary deposits in the basins of the Save and Maritza, and in Suli.

On the high lands, the cold is excessive in winter, owing to the north-east winds, which blow from the bleak and icy steppes of Southern Russia; and the heat of summer is almost insupportable in the western valleys. Violent climatic change is, on the whole, the rule in European Turkey; but those districts which are sheltered from the cold winds, as the Albanian valleys, enjoy a comparatively equable temperature. The soil is for the most part very fertile; but owing to the positive discouragement of industry by the oppressive system of taxation which was long in force, little progress has been made in the art of agriculture, and the most primitive implements are in common use. The cultivated products are maize in the south; rice, cotton, rye, barley in the centre, and millet in the north; the natural products are the pine, beech, oak, lime, and ash, with the apple, pear, cherry, and apricot in the Danube basin; the palm, maple, almond, sycamore, walnut, chestnut, carob, box, myrtle, laurel, &c., in the provinces south of the Balkan; large forests of fir and pine in the north-west; the olive, orange, citron, vine, peach, plum, and other fruit-trees in Albania; and abundance of roses in the valley of the Maritza. The mineral products are, iron in abundance, argentiferous lead ore, copper, sulphur, salt, alum, and a little gold, but no coal. The wild animals are the wild boar, bear, wolf, wild dog, civet, chamois, wild ox, and those others which are generally distributed in Europe. The lion was formerly an inhabitant of the Thessalian Mountains.

TURKEY IN ASIA.—This portion of the Turkish Empire is more hilly than the other, the two almost parallel ranges, Taurus and Anti-Taurus, which are the basis of its mountain-system, cover almost the whole of the peninsula of Asia Minor or Anatolia (q. v.), with their ramifications and offshoots, forming the surface into elevated plateaux, deep valleys, and enclosed plains. From the Taurus chain, the Lebanon range proceeds southwards parallel to the coast of Syria, and diminishing in elevation in Palestine, terminates on the Red Sea

coast at Sinai. Besides the Euphrates (q. v.), Tigris (q. v.), and Orontes (q. v.), the only important rivers of Turkey in Asia are the Kizil-Ermak, which rises on the borders of Cilicia, and after a devious course across the peninsula, falls into the Black Sea, near Samsoun; the Mæander and Sarabat, which flow to the Ægean; and the Sakaria, which empties itself into the Euxine. On the whole, Turkey in Asia is ill-supplied with water; and though the mountain slopes afford abundance of excellent pasture, the plains, and many of the valleys, especially those of the Euphrates, Tigris, and Jordan, are reduced by the parching droughts of summer to the condition of sandy deserts. In ancient times, these now desert districts were preserved in a state of fertility by artificial irrigation; but during the six centuries of almost constant war which convulsed this once fair region, the canals were neglected, and have, ever since the rise of the Osmanli power, remained in an unserviceable condition. Nevertheless, the fertile portions produce abundance of wheat, barley, rice, maize, tobacco, hemp, flax, and cotton; the cedar, cypress, and evergreen oak flourish on the mountain slopes; the sycamore and mulberry on the lower hills; and the olive, fig, citron, orange, pomegranate, and vine on the low lands. The mineral products are iron, copper, lead, alum, silver, rock-salt, coal (in Syria), and limestone. The fauna includes the lion (east of the Euphrates), the hyena, lynx, panther, leopard, buffalo, wild boar, wild ass, bear, wolf, jackal, jerboa, and many others; and the camel and dromedary increase the ordinary list of domestic animals.

Industry, Manufactures, and Trade.—Notwithstanding the primitive state of agriculture in T., the extreme fertility of the soil, which returns from 25 to 100 fold, makes ample amends for this defect, and supplies materials for the comparatively unimportant manufactures and industries of the country. The products are wax, raisins, dried figs, olive oil, silks, red cloth, dressed goat-skins, excellent morocco, saddlery, swords of superior quality, shawls, carpets, dye-stuffs, embroidery, essential oils, attar of roses, plum-brandy, &c. The commerce of T. is extensive and important, and is rapidly increasing. The average annual value of the imports of Turkey in Europe is estimated at £18,500,000 (about $90,000,000), and of the exports £10,000,000 (about $48,000,000). The exports are the surplus of the above-mentioned natural and manufactured products of the country, also wool, goat's hair, meerschaum clay, honey, sponges, drugs, madder, gall-nuts, various gums and resins, and excellent wines; the imports are manufactured goods of all kinds, glass, pottery, arms, paper, cutlery, steel, amber, &c. The principal commercial ports of the country are Constantinople, Trebizond, and Smyrna. The trade of T. is, however, greatly impeded by the difficulty of land-transit; though in 1874, 1608 kilometres (about 1000 miles) of railway had been completed, viz., a line from Varna to Roustchouk; from Kustundie to Tchernavoda, from Constantinople to Adrianople, from Adrianople to Bellova, from Koulleli to Dedeagahtch, from Salanique to Uskub, from Uskub to Elleshan, from Novi to Banjalouka, lines from Roumelie, two lines from Smyrna, and a line from Ismid to Scutari.

Population.—A more heterogeneous aggregation of races than that which constitutes the population of the Turkish Empire can hardly be conceived. Of Turks, there are the Osmanlis, the ruling race, and the Turkomans; of Sclaves, the various peoples of Bulgaria, Servia, Bosnia, Herzegovina, and Montenegro, and numerous other races. According to estimates, in 1867 there were—in Europe 4,492,000 Turks; Sclavonians, 6,200,000; Roumanians, 4,000,000; Greeks, 1,000,000; Albanians, 1,500,000; Armenians, 400,000; Circassians, 595,000; Koords, 16,000; Gipsies, 214,000, and Jews, 70,000,—a total of 18,482,000; in Asia, Turks, 10,700,000; Armenians, 2,000,000; Druses, 1,000,000; Greeks, 1,000,000; Arabs, 900,000; Circassians, 413,000; Moors, 75,000; Tartars, 85,000; Jews, 80,000; Koords, 20,000, and Syrians, 30,000,—a total of 16,463,000; and in Africa, Arabs, 5,050,000:—forming a grand total of 39,995,000. The Greeks and Armenians are traders; the Turkomans and Koords are herdsmen and nomads; the Sclaves, Roumans, and Albanians are the chief agriculturists in Europe, and the Osmanlis, Armenians, Syrians, and Druses in Asia. Of the whole population, about 24,000,000 are Mohammedans, and 15,000,000 Greek and Armenian Christians.

Administration, Religion, Education.—The government of T. is a pure despotism, the sovereign, who is commonly styled Sultan, having also the titles Padishah, Grand Seignior, Khan, and Hunkiar; but though nominally absolute, his power is much limited by the *sheikh-ul-islam*, the chief of the *Ulemas* (q. v.), who has the power of objecting to any of the sultan's decrees, and frequently possesses more authority over the people than his sovereign. The supreme head of the administration, and the next in rank to the sultan, is the grand vizier (*sadri-azam*), under whom are the members of the cabinet or divan (*menasybi-divaniié*), namely, the presidents of the supreme council of state (*alkiami-adlié*) and of the Tanzimat (q. v.), the *Seraskier* (q. v.), the *capudan pasha*, or high-admiral, and the other heads of departments of the administration. The governors of the *eyalets*, or provinces, are styled *walis;* each eyalet is divided into *sanjaks*, or *livas*, ruled by *kaïmakams;* each liva containing a number of *cazas*, or districts; and each caza a number of *nahiyehs*, composed of villages and hamlets. The provincial governors have no longer the power of life and death; and the introduction of the system of tax-collection in practice in Western Europe, has greatly diminished their power of practising extortion on those under their rule. The variable imposts are, however, farmed, but considerable restrictions are imposed on the farmers to prevent oppression. The established religion is Mohammedanism, but all other sects are recognised and tolerated; and since 1856, a Mussulman has been free to change his religion at pleasure, without becoming liable to capital punishment, as was formerly the case. Education was long neglected, but in 1847 a new system was introduced; and since then, schools for elementary instruction have been established throughout T.; and middle schools for higher education, and colleges for the teaching of medicine, agriculture, naval and military science, &c. Many wealthy Turks, however, send their sons to France or Britain to be educated. The newspapers published in T. are about 20 in number; and are printed in various languages, four being in Turkish, two in Greek, and two in French.

Revenue, Army and Navy.—The estimated revenue and expenditure for the year 1874—1875 were respectively £19,646,336 (about $95,481,000), and £20,117,664 (about $97,371,847); the items being:

REVENUE.

Direct Taxes—	
Capitation Tax (*verghi*),	£2,607,768
Land Taxes, License, &c.,	600.000
Military Tribute,	666,708
Indirect Taxes—	
Tithes of Harvest, &c.,	5,600,000
Quarterly Tithes,	1,400,000
Excise on Sheep and Hogs,	1,765,908
Silk,	43,276
Customs,	1,660,000
Leased Lands,	600,000
Tobacco,	1,200,000
Stamps, and other Income, &c	944,000
Salaries, Trusts, Mines, &c.,	1,423,540
Minister of Marine and Commerce and Police,	114,952
Telegraph and Post-office, &c.,	366,00[illegible]

Revenue from Egypt,	600.000
" " Roumania,	32.000
" " Servia, Samos, &c.,	22.176
Total,	£19,646,336
Expenditure.	
Public Debt,	£7,550,072
Dotations,	1,592,000
Restitutions,	104.268
Minister of Interior,	2,274,916
Minister of Justice,	370.008
Minister of Foreign Affairs,	150.000
Minister of Finances,	1,279.452
Minister of War,	3,322.328
Artillery	720,000
Minister of Marine,	800,000
Minister of Commerce and Sanitary Service,	70,952
Minister of Public Instruction,	100,000
Minister of Public Works,	1,783,668
Total,	£20,117,664

The Osmanlis are exempted from the capitation tax. The public debt in 1874 was 4,335,237,191 fr. (about £180,634,880), floating debt 334,665,441 fr.

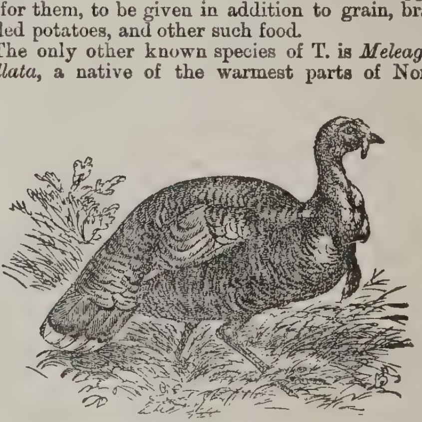
The regular army (*nizam*) was formerly divided into six army corps, and numbered, in all, 110,496 men; with detached divisions, garrisons, &c., of 30,000, of whom 21,200 were effective. In June, 1869, a decree was promulgated for the organization of a permanent army, of which the active part comprised 150,000, with a reserve of 60,000 men, a second reserve of 192,000, and garrison troops numbering 30,000; a total of 702,000 men. The term of service was made 4 years, instead of 5, as formerly. The fleet in 1870 consisted of 13 iron-clads, of 216 guns; 27 screw steamers, of 645 guns; 9 corvettes; 13 advice-boats, of 820 guns; 12 gunboats, of 28 guns, and 35 transports, of 52 guns; total of 109 steamers, of 1761 guns, and 53 sailing vessels. The merchant marine amounted in 1873 to 224 sailing vessels, of 34,711 tons, and 9 steamers, of 3049 tons. The vessels that entered the port of Constantinople in 1868 numbered 22,141, of 5,037,448 tons, and the clearances were 22,542, of 5,064,571 tons. In 1873 the number had increased to 43,582 vessels, of 4,878,500 tons. The length of the telegraph lines in 1870 was 25,487 kilometres.

The history of T. is given under OTTOMAN EMPIRE.

TURKEY (*Meleagris*), a genus of gallinaceous birds of the family *Pavonidæ*, or, according to some ornithologists, of a distinct family, *Meleagridæ*, both, however, being included by others in *Phasianidæ*. The head is bare, the neck wattled, and the bill of the male surmounted with a conical fleshy caruncle, sometimes erected, sometimes elongated and pendulous. A curious tuft of long hair springs from the base of the neck of the male, and hangs down on the breast. The bill is rather short, strong, and curved; the tail is broad and rounded, capable of being erected and spread out, as the male delights to do when he struts about in pride, with wings rubbing on the ground, uttering his loud peculiar *gobble*. The COMMON T. (*M. gallo-pavo*), the largest of gallinaceous birds, well known as an inmate of our poultry-yards, is a native of North America. It appears to have been introduced into Europe in the beginning of the 16th c., and is naturalised in some places; as it may be said to have been in the royal park of Richmond, near London, in the first half of the 18th c., when that park contained about two thousand turkeys; but in consequence of the frequent fights between poachers and keepers, it was thought proper to destroy them. Fewer attempts have been made than might have been expected to introduce the T. in parks and woods in Britain, where it might probably be expected to succeed as well as the pheasant. In a domesticated state, the T. varies much in plumage; in its wild state, this is not the case. The plumage of the wild T. is also richer, and its power of wing greater; but the wings even of the wild bird are short, scarcely extending beyond the base of the tail. The darkest-coloured of domesticated turkeys most nearly resemble the wild T. in plumage. In its native woods, it seems to attain even a larger size than in the poultry-yard. Turkeys were once plentiful in the forests of the Atlantic states of North America, and as far north as Lower Canada, but have disappeared as cultivation has advanced, and have become rare even in the eastern parts of the Valley of the Mississippi, where their numbers were once very great. The T. is found as far south as the Isthmus of Darien, but does not occur to the west of the Rocky Mountains. It inhabits the woods of the larger islands of the West Indies. In warm climates, it is said to produce two or three broods a year; but in colder countries it produces only one. The males associate in flocks of from ten to one hundred, and seek their food during great part of the year apart from the females, which go about singly with their young, or associate in flocks, avoiding the old males, which are apt to attack and destroy the young. At the pairing-time, desperate combats take place among the males. Wild turkeys roost on trees. They feed on all kinds of grain, seeds, fruits, grass, insects, and even on young frogs and lizards. They make their nests on the ground, merely gathering together a few dry leaves, and often in a thicket. The eggs are usually from nine to fifteen in number, sometimes twenty. They spread themselves in summer over the higher grounds; but in winter, congregate in the rich low valleys. The sexes mingle in winter, and form larger flocks than in summer.

On account of its size, and the excellence of its flesh and eggs, the T. is one of the most valued kinds of poultry. The management of it differs little from that of the common fowl. The young are tender for the first few weeks, and require care, particularly to keep them from getting wet by running among wet grass, or the like; but afterwards they are sufficiently hardy. Nettles are excellent food for turkeys, and are often chopped up for them, to be given in addition to grain, bran, boiled potatoes, and other such food.

The only other known species of T. is *Meleagris ocellata*, a native of the warmest parts of North



American Wild Turkey (*Meleagris ocellata*).

America. It is not quite so large as the Common T., and has a smaller tail. The neck is less wattled, but the head has a number of fleshy tubercles. The plumage is beautiful, rivalling that of the peacock in metallic brilliancy: blue, green, bronze, red, and golden hues being intimately and finely mingled, and forming *eyes* on the tail; whence the specific name.

TURKEY BUZZARD. See VULTURE.

TURKEY-RED. This celebrated colour—the most durable, and perhaps one of the most beautiful which has yet been produced on cotton—is dyed by a process supposed to have been practised in India from immemorial time. It passed from thence through other parts of Asia to the countries of the Levant, and was introduced into France about the middle of last century. The first successful attempt to introduce it into Great Britain was made in Glasgow in 1783, by a Rouen dyer named Papillon, in conjunction with Mr George Macintosh, the father of the inventor of waterproof cloth. They established the celebrated Turkey-red business now carried on by Messrs Henry Monteith & Co. By an agreement with the Trustees for Manufactures in Scotland, Papillon allowed them to make his process public in 1803; and since then, Turkey-red dyeing has been extensively carried on in Glasgow and its neighbourhood, and also in Lancashire.

There is a mode of dyeing cotton red with madder practised by calico-printers—the cloth being previously bleached with chloride of lime—where the whole process only occupies a day or two. But in the case of Turkey-red, which is also a madder-dye, the operations are long and tedious, and the bleaching with chloride of lime especially objectionable. The following is an outline of the steps in the Turkey-red process, as usually conducted: 1. Unbleached calico is thoroughly washed at a dash-wheel or other washing-machine, and then boiled for some time in a solution of carbonate of soda. 2. The cloth is soaked in a bath containing a soapy emulsion of olive oil, sheep's dung, carbonate of sodium and water; and allowed to remain for a week or more impregnated with the solution, after which it is aired in the field, and dried in stoves. This operation is repeated at least three times. 3. The next stage, sometimes called 'liquoring,' consists in passing the cloth through an emulsion of olive oil and carbonate of sodium, but without sheep's dung; after which it is aired in the field, and dried in stoves, as in the last operation. The 'liquoring' is repeated at least four times. 4. The cloth now requires to be soaked in a weak alkaline lye of pearl-ash and soda, in order to remove any excess of oil. 5. The cloth is warmed in a bath containing a mixture of powdered oak-galls and sumach, or either of these substances alone, the operation being sometimes called 'galling,' and sometimes 'sumaching.' 6. The cloth is next steeped for twelve hours in a solution of alum, partially neutralised by carbonate of sodium, but sometimes acetate of aluminium is used instead of alum. Without this treatment, the dye could not be fixed upon the cotton. See DYEING. 7. When thoroughly washed, the cloth is ready to receive the red dye, which is produced by immersing it in a decoction of madder, to which some chalk and bullock's blood are sometimes added. It is put into the dye-beck when cold, and kept in it for two hours after it has been raised to the boiling-point. 8. It is next boiled in a weak solution of soap and soda, which removes a brown colouring matter present in the madder-dye, but more fugitive than the red portion. 9. Finally, the dyed cloth is cleared or brightened by boiling it in a solution of chloride of tin, and then washing and drying it. A more recent plan is to employ chloride of lime for the clearing.

The theory of Turkey-red dyeing is not well understood, which so far accounts for the fact, that it has been found impossible materially to shorten the process. The three most essential operations are the oiling, or rather the impregnation with an oleaginous soap, the mordanting with alumina, and the dyeing with madder; but it is found, that if any of the numerous dippings in the oily emulsions are left out, the colour is inferior in proportion to the number of omissions. This is the least understood part of the process, and is no doubt the cause of the rich appearance of the dye, which approaches some of the fine reds produced on wool.

Besides being largely used in its plain state, Turkey-red cloth is extensively employed for handkerchiefs with white patterns produced upon them by discharging the colour (see BANDANA); and of late years, articles of various kinds, with patterns in several colours, have been produced by ordinary calico-printing machines, where, by proper arrangements, the different colours are obtained on parts where the red colour is discharged by chloride of lime.

TURKEY-STONE. See HONES.

TURKISH LANGUAGE AND LITERATURE. The Turkish is one of the Turanian (q. v.) idioms, and is chiefly divided into Eastern and Western Turkish. The former is mainly represented by the Uigur (Jagatai), an idiom but recently recognised not only to belong to the Turkic stock, but to be its most ancient representative. Its forms are fuller and more pure, albeit, to a certain extent, harder and rougher. Its alphabet is formed from the Zabian, out of which have sprung also the Mongol and Mantshu. Besides this, the Kiptchak, spoken in Kasan and Astrakhan, forms a principal branch of the Eastern Turkish, for which, however, but little has hitherto been done from a philological point of view.

Of infinitely higher importance, however, is the Western Turkish, or language of the Osmanlis, which, through the conquests of that race, has spread far and wide over the whole of Western Asia, the Levant, and parts of Europe. The Osman or Western Turkish (emphatically Turkish) is more melodious and soft than the former, and so much mixed with foreign elements, chiefly Arabic and Persian, that, were it not for its grammar, which is purely Tatarian, it could hardly be called an original language, but rather a conglomeration of the three respective idioms. Besides, it has also received a large increase of words from other Asiatic and European languages, e. g., the Chinese, Greek, and Italian. It is one of the most widely spoken idioms; not only Western Asia, but even the east of Europe, use this tongue to a great extent for commercial and political transactions. The characters in which it is now written are no longer the original Uigur letters, but the Arabic, the 28 characters of which have been increased by the four additional Persian characters —produced by further diacritical points, and a new one of their own, amounting in all to 33, which are written from right to left, as is the case in all (save one) Semitic languages. But this alphabet is not well suited to a language composed, like this, of elements belonging to the three great families of speech, viz., Semitic, Indo-European, and Turanic. Neither the vowels nor the consonants are adequately represented in all cases. Occasionally, however, it is also written in Armenian characters, which renders its sounds much more faithfully. There is no definite article or gender. The plural is indicated by a final *lar* or *ler*, and the cases are formed by the addition of *ung*, *eh*, *i*, *den*, and *le* for gen., dat., accus., abl., and instrumental respectively; which are, in plural, affixed to the *ler* or *lar*. The adjective has no flexion, but is placed unchanged after the noun. Diminutives are formed, somewhat like in Italian, by suffixes. The comparative and superlative are formed by circumlocution. The personal pronouns are without gender, and their declension is like that of the nouns. The possessive pronouns are made by suffixes. The Turkish verb is of a very

complex nature. There are seven *genera* (Active, Passive, Negative, Impossible, Causal, Reciprocal, Reflexive), all of which are formed by certain monosyllables affixed or prefixed. The root of the verb is the second person singular imperative, to which the infinitive affix *mak* or *mek* is joined. The moods and tenses are formed chiefly by the addition of the respective forms of the auxiliary verb *olmak*, to be. Apart from this, there are special particles to express the optative, conjunctive, &c. Conjunctions are either formed by gerundives or possessive forms, or they are borrowed from Persian and Arabic. Adverbs are formed by certain suffixes. The Turkish construction is most peculiar: the genitive always precedes the nominative, and the verb always stands at the end. All this gives the Turkish style a peculiarly artificial and inverted appearance, and often a sentence cannot be in the least comprehended until it is quite finished. Oriental flourishes, and allegorical figures of speech, with which Turkish is very lavish, do not tend to facilitate the study of the language.

The original literature of Turkey is to be found in the scanty remains of the Uigur period. That remote eastern branch of the Turkish family had, after their emigration from their homes, south of the Lake Baikal, to the Tangnu Tagh, played a foremost part in the contests and migrations of Central Asia, until they disappeared in the Mongol Empire about 1200 A.D. They were acquainted with Chinese literature, and had adopted the Buddhist doctrines to a certain extent, and their scanty literary relics bear traces of these influences. When, however, the Turks, in the 11th c., began their conquest of the countries of Mohammedan Asia, they learned to appreciate the literature of Persia, then beginning to grow up in its full glory; and ever since, Turkish literature and Turkish language have retained a strong Persian impression. Two branches of Turkish literature are usually distinguished—first, the Eastern or Jagataian, which chiefly flourished between Timur's and Baber's time (1400—1530). Mir Ali Shir, the vizier of Sultan Hussein, is the most renowned poet of this period. He also collected the most ancient Jagatai poems. Sultan Baber, also belonging to this epoch, wrote Memoirs of his life and time (translated into English), which are of considerable importance. The other or Turkish literature, principally so called, is exceedingly rich, but hardly deserving the name of an original literature, it being, for the greatest part, a mere imitation of Persian and Arabic models. Of early writers, deserve special mention Sheikhi, a romantic poet and physician, and Soleyman Tchelebi. In the 16th c., the most flourishing period of Turkey, we find Meshihi, the poet; Kemal Pasha Zadeh, the historian and jurist. In history, we have, besides annalists like Saad-ed-Din, historians like Mohammed Effendi. Of the same epoch is Lamii, who excelled in many branches of literature, besides being an accomplished translator of Persian poets. Fasli (d. 1563) and Baki, the chief of Turkish poets (d. 1600), conclude this period, which is followed by another of great activity, but of inferior rank. It boasts of Nebi, the poet; Neti, the satirist; but above all, Hadji Khalifah (q. v.), the eminent historian, geographer, and encyclopædist. Raghib Pasha stands out in the 18th c., together with Said Rufet Effendi, and a number of smaller writers. Little is to be told of the present stage of Turkish literature; but there is a great activity now visible in the province of educational works, and the reproduction of ancient writings; a feature which augurs well for the future. Redhouse's (Par. 1846) and Kasem-Beg's (Kasan, 1845; Ger. by Zenker, 1847) are the best known English-Turkish grammars; and Kieffer and Bianchi's (*Dictionnaire Turc-Française*, 2 vols., Par. 1835), as well as Redhouse's and Zenker's, among the best dictionaries of the Turkish language.

TURKMANSHAI, a village of Azerbijan, 65 miles east-south-east from Tabriz, is the place where, on February 22, 1828, was concluded the treaty between Persia and Russia, by which the former resigned to the latter the provinces of Erivan and Nakchevan.

TURKS, the name of a numerous, important, and widely-spread family of the human race, members of which are to be found as well on the banks of the Lena in Siberia, as on those of the Danube and the shores of the Adriatic in Europe. The T. belong to the second of Blumenbach's five great divisions of mankind—viz., *Mongolians;* and to the first, or *Mongolidæ*, in Dr Latham's three-fold classification. In this latter classification, the T. form a branch of the Turanian stock of Altaic Mongolidæ. Their geographical distribution, according to Dr Latham, is as follows: '1. As a continuous population. East and west; from the neighbourhood of the Lake Baikal, 110° E. long., to the eastern boundaries of the Greek and Slavonic countries of Europe, about 21° E. long. North and south; from the northern frontiers of Tibet and Persia, about 34° N. lat., to the country north of Tobolsk, about 59° N. lat. 2. As an isolated population. Along the lower course of the Lena, and the shores of the White Sea, chiefly within the Arctic Circle. 3. As portions of a mixed population in China, Tibet, Mongolia, Persia, Armenia, the Caucasian countries, Syria, Egypt, Barbary, Greece, Albania, and the Slavonic portion of Turkey in Europe.' The names Tourkoi, Turkai, and Turcæ occur in some ancient authors as applied to a Scythian people dwelling in Asiatic Sarmatia, and it is very likely that the Scythians of antiquity were allied in blood with the numerous existing Turkish tribes, if not absolutely their ancestors. The original seat of the T. was probably upon the northern slopes of the Altai range, from which, while a portion emigrated into Independent Turkestan, others, going south-south-east, established themselves upon the confines of the Chinese Empire. MM. Abel-Rémusat, Klaproth, Ritter, and other high authorities, concur in tracing all the now existing Turkish tribes to the Hiong-nu, a powerful nation who, prior to the Christian era, threatened to overrun and subjugate China, and who then occupied the whole of the vast region now called Mongolia, from the north of China to Mount Altai. Dr Prichard coincides in this opinion. The Hiong-nu (or *Vile Slaves*, so called by the Chinese), indeed, for some time succeeded in establishing a kind of rule in China, and even intermarried with the imperial family; but about the commencement of the Christian era, their power in China began to wane, and before the end of the 2d c. they were driven back as far as Independent Turkestan. 'After the fall of the empire of Hiong-nu,' says Prichard, the T. 'are known in Chinese history by the name of Thu-k'iû, or Turks, and Whey-ou-eul, by Europeans written Huy-hurs, and more correctly, Uigours. The Uigours, or Eastern Turks, whose history has been elucidated by Abel-Rémusat, are the link of connection between these more remote nations and the Seljuki and Osmanli Turks, who are known to European historians.'

After the fall of the Hiong-nu empire in China, the tribes who composed its strength separated, some maintaining themselves in their acquired settlements, and even conquering portions of China; but by far the greater number spread westward over Western Mongolia, East and West Turkestan,

and Southern Siberia, and gradually lost their power and unity as a nation. Out of this débris of a fallen people arose, in the 5th c., the great empire (the empire of Kiptchak) of the Thu-k'iü, which contested the supremacy of Central Asia with the Chinese on the east, and the Sassanidæ (q. v.) on the west, ultimately falling in 744 before the Hoei-he, a confederation of Turkish tribes which had hitherto been subject to it. The Hoei-he, attacked in the west by the Hakas (the ancestors of the present Kirghis), yielded to their assailants in 848, but retained their power east of the Bolor-tagh, and for 150 years longer ruled supreme from that range to the Hoang-ho. During the eight centuries succeeding their expulsion from China, a regular though slow progress westward had been maintained by some of the Turkish tribes, a portion of whom appear (5th c. A. D.) in Southern Russia, and on the northern frontier of the Byzantine Empire, driving before them the kindred race of the Avars. They were found in Syria and Mesopotamia in the 7th c., and about the same time wandered into Northern and Eastern Khorassan. But the seat of power of the Turkish race still was in Central Asia, whence in the 10th c. the Seljuks (q. v.) emerged, conquering Persia, Syria, and Asia Minor, and establishing an empire which reached from Constantinople to the borders of Mongolia. The subdivision of the Seljuk empire in South-western Asia led to its gradual absorption by the Khaurezmians in the north, and the Kurds in the west, till the irresistible tide of Mongol invasion under Genghis Khan (q. v.), rolling over Central and Western Asia, and the east of Europe, completely overwhelmed Turkish dominancy. The great empire of Timur (q. v.) was Turk, with a strong infusion of the Mongol element, the residue of Genghis's irruption; and its destroyers, the Uzbeks (q. v.), and the various other tribes—Khirghis, Kiptchaks, Turkomans, &c.—which now possess its extensive domains, are also of Turkish race. The Osmanli-Turks are descended from a portion of the Turkish tribe of the Kayi, which fled from its settlements in Khorassan before the Mongols, and took refuge with the Seljuks of Iconium. See OTTOMAN EMPIRE, SELJUKS, &c.

The following is the enumeration of the principal Turkish tribes given by Dr Latham: '1. *Uigurs.*—On the Mongol frontier. Belonging to China. The Uigurs were the first Turks that used an alphabet. Little known. 2. *Turks of the Sandy Desert.*—Conterminous with Mongolia and Tibet. 3. *Turks of Khoten, Kashgar, and Yarkend.* 4. *Kirghis.*—Independent Tartary. The Kirghis (q. v.) form a portion of the population of the highest table-land in Asia—perhaps in the world—Pamir and the source of the Oxus. 5. *Uzbeks* (q. v.).—The Turks of Bokhara. 6. *Turkomans.*—The Persian frontier of Independent Tartary from Balkh to the Caspian. Pastoral robbers. 7. *Ottoman or Osmanli.*—The Turks of the Turkish Empire. 8. *Nogays.*—The Turks of the parts between the Black Sea and the Caspian, north of Caucasus. 9. *Turks of the Russian Empire.*—Bashkirs, Teptyars, Baraba, &c. With all these, although the language is Turk, there is good reason to believe that the original substratum is Finn. With the Bashkirs, this is generally considered to be the case. 10. *The isolated Yakuts of the Lena.*'

In physical appearance, all these tribes, with the exception of the Ottoman T., partake more or less of the Mongolian type. They have in general a broad, flat face, with prominent cheek-bones, the head from side to side nearly equal to its length from the forehead to the occiput, the nose flat, the eyes small, the colour of the skin yellowish, straight hair little or no beard, and stature undersized. It is among the nomad and agricultural T. that these characteristics are most prevalent, while among the more civilised they almost entirely disappear. Dr Prichard quotes Lieutenant Wood's account of the Kirghis as a good average description of the primitive Turkish tribes. 'In stature,' he says, 'the Kirghis are under the middle height; of a *kyl* numbering seven men, the tallest was 5 feet 5½ inches in height. Their countenance is disagreeable; the upper part of the nose sinks into the face, leaving the space between their deeply-seated and elongated eyes without the usual dividing ridge; the brow immediately above the eye is protuberant, but starts back more abruptly than in Europeans; their cheeks, large and bloated, look as if pieces of flesh had been daubed upon them; a slender beard covers their chin; and in those individuals who have more luxuriant hair, the beard has a natural curl. Their persons are not muscular. Their complexions are darkened by exposure to all weathers rather than by the sun. The women are rather good-looking, and of delicate form, like the Hazaras, and make good wives.' The T. of the Turkish Empire, especially those of the upper classes, differ considerably from the type here described. The Ottoman T., in fact, both in feature, height, and general physical structure, bear a strong resemblance to other European nations. This is accounted for chiefly by the custom now prevalent among them for ages of intermarrying with Circassian females.

The various Turkish tribes speak very nearly the same language; 'so much so, that the Yakut of the Icy Sea is said to be intelligible to the Turks of Central Asia, and even of Constantinople.' In religion, the T. are for the most part Mohammedans; but the Yakuts are Shamanists; the T. bordering on the Chinese Empire are Buddhists; and those of Siberia, Christians of the Russo-Greek Church.

TU'RMERIC (*Curcúma longa;* see CURCUMA), a plant of the natural order *Scitamineæ*, a native of the East Indies, much cultivated both in India and in Cochin-China. The leaves are lanceolate, sheathing each other at the base, about a foot long; they spring from the crown of the root, and from their centre rises a short leafy spike, with small cream-coloured flowers. The root is divided into several fleshy fingers, oblong, and as thick as a man's thumb, sometimes crooked when young, and the root then abounds in a kind of arrow-root; but in a more advanced stage, it contains in large quantity a peculiar, resinous, yellow substance, which is used as a dye-stuff, and for other purposes, and is called *Turmeric.* It appears in commerce in the form of dried roots, or as a powder. It depends for its value chiefly on a resinous principle called *Curcumin*, which is scarcely soluble in water, but easily soluble in alcohol and ether. The yellow colour obtained from T. is not very durable, although it is employed as a dye both for silk and wool. Chemists make much use of T. as a test for alkalies, which change its yellow colour to reddish brown, as do also their carbonates and phosphates, some of the alkaloids, and boracic acid. T. test-paper is made by immersing unsized paper in tincture of turmeric. It is much employed in the East in medicine, as a gentle laxative, diuretic, and stimulant. It is also much used as a condiment with many kinds of food, and is the principal ingredient in *Curry-powder.* For its cultivation, T. requires a rich friable soil, and a situation not liable to be flooded. It is propagated by cuttings of the root, which are planted at distances of eighteen inches or two feet. It is planted in April or May, and the crop is gathered in December. This kind of T. is sometimes distinguished by the name of LONG T.; and the name of

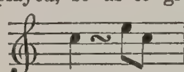
ROUND T. is given to *Kæmpferia pandureta*, a plant of the same order, also a native of the East Indies, the roots of which are shorter and rounder, but otherwise of very similar quality. They are not nearly so much an article of commerce as the other kind, but are particularly valued for the preparation of an artificial gold varnish, as they yield a better colour than the long or true Turmeric. The Arabic name of T. is *Kurkum*, whence *Curcuma*.

TURN, in Music, an embellishment formed by the adjoining notes above and below combined with the principal note, and indicated by the sign ~. Thus

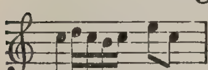
is played thus:

or

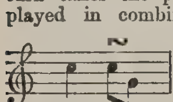
Should another than the principal note follow the turn, the principal note is added before the next note is played, so as to give the turn four notes; thus:



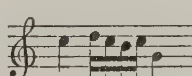
is played



In either of these cases, the turn must be played during the time of the principal note. But when the sign ~ is placed above or below the principal note, the first note of the turn takes the place of the principal, which is played in combination with the others; thus



is played



TURNAU (Boh. *Turnóv*), a walled town of Bohemia, circle of Jung-Bunzlau, on the east bank of the Iser, 50 miles north-east of Prague. It has a church, built in 1825, which is reckoned one of the most beautiful in Bohemia. T. has manufactures of cotton, woollens, and more particularly artificial gems, which are exported in great quantities to the United States. Pop. 4700. Here was fought (July 1866) a battle between the Prussians and Austrians, in which the former were victorious.

TURNER, JOSEPH MALLARD WILLIAM, the greatest of British landscape-painters, was born at 26 Maiden Lane, Covent Garden, London, in 1775. The precise day of his birth is unknown; but an approximation to it is furnished by his baptism, which is registered in the parish church as of date 14th May of that year. He was the son of a barber, and received an exceedingly defective education. His turn for art shewed itself very early, and drew attention to the boy. To a Dr Monro, in particular, who gave him access to his excellent collection of water-colour drawings, and otherwise kindly furtherance, he used afterwards to express his obligations. In 1789, he became a student at the Royal Academy, where, doubtless, he learned something; but throughout he seems to have been indebted less to any formal teaching than to the tentative efforts of his own singularly original genius. In 1787, when only twelve years old, he exhibited two drawings at the Royal Academy. Again, in 1790, he exhibited; and thence onwards till his death, with intermission of only one or two years, his pictures were regularly to be found on the walls. His success is sufficiently shewn in the fact, that so early as 1799 he was elected an Associate of the Royal Academy, and only three years afterwards, attained the full dignity of Academician. The honour was worthily bestowed on one whose claim was already admitted as the first landscape-painter of his time; but his election in 1807 to the post of Professor of Perspective could scarcely be considered so judicious. A man so abnormally illiterate that his simplest note included a crop of solecisms, was not likely to succeed as a lecturer; and as a lecturer he failed utterly. The knowledge which he abundantly possessed, he could not in the least communicate; and after a very few years, he ceased to make the attempt. In the exercise of his art, T. travelled much; he was frequently in Scotland, France, Switzerland, and the Rhine countries; and in 1819, 1829, and 1840, he paid visits to Italy. His industry was almost as unexampled as his genius. To the exhibitions of the Royal Academy, he contributed in all 259 pictures; but among these, many of his finest works were not included; and in another branch of art, the amount of his achievement was extraordinary. In 1808, he commenced the publication of his famous *Liber Studiorum*, a series of engravings from original designs, which ranks as one of his most important undertakings; to this is to be added his *Scenery of the Southern Coast*, *England and Wales*, *Rivers of England*, *Rivers of France*, &c.; and besides, his services were continually in request as an illustrator. The illustrated edition of Rogers's *Poems* is his most celebrated work in this kind, and is quite unique in magnificence. At his death, which took place 19th December 1851, at Chelsea, where his few last years were passed in a small house by the river-side, it was found that he had bequeathed to the nation the noble collection of his works, which now occupies a room in the National Gallery, and remains a permanent monument of the power and splendour of his genius, if also of its occasional eccentricity and extravagance. The large fortune, amounting to something like £200,000, which he had amassed by his industry and thrift combined, he left to found an asylum for decayed artists; but owing to some technical defect in his will, this purpose could not be carried out.

Of the genius of T., and the various phases through which it was developed till it sunk in the decay and deliration obvious in the work of his few last years, we cannot here attempt to treat. In the eloquent pages of Mr Ruskin's *Modern Painters*, the subject will be found thoroughly discussed. Some years since, a *Life of Turner*, in two volumes, was published by Mr Walter Thornbury. The picture it presents is a somewhat dark and painful one. This creator of the beautiful on canvas was in his character and way of life by no means so surprising a revelation of it. He was coarse, sensual, sordid, avaricious: of his inordinate passion for money, many odd anecdotes are extant; but it is only fair to say, that by the few friends who knew him intimately, he was held to be essentially a man of kindly and generous nature. He lies buried in the crypt of St Paul's, beside Sir Joshua Reynolds.

TURNER, SHARON, the Anglo-Saxon historian, was born in London, September 24, 1768, articled to an attorney at the age of fifteen, and succeeded his master in the business before the period of his clerkship had expired. He continued, however, to gratify his literary tastes; and after years of hard reading and patient collection of materials, published, 1799—1805, a *History of the Anglo-Saxons*, in 3 vols., a work, with all its imperfections, that has given its author a permanent place in English literature. Other writings of T.'s are: *The History of England from the Norman Conquest to* 1509 (1814); *History of Henry VIII.* (1826); and *Reigns*

of *Edward VI., Mary, and Elizabeth* (1829); all of which were subsequently republished together under the title of *History of England from the Earliest Period to the Death of Elizabeth; Sacred History of the World as displayed in the Creation and Subsequent Events to the Deluge* (1832, *et seq.*); a volume of essays and poems, &c. T. died February 13, 1847.

TURNHOUT, a well-built town of Belgium, province of Antwerp, 34 miles east-north-east of the city of Antwerp, in the district known as the Campine (see BELGIUM), and the terminus of a branch-line of the Brussels and Antwerp Railway. The inhabitants manufacture ticking, and linen and lace goods, cutlery, paper, oil, &c. Pop. nearly 14,000. T. is historically noteworthy as the scene of two battles, the first won 22d January 1597, by the Netherlanders, under Maurice, Prince of Orange, over the Spaniards; and the second, 27th October 1789, by the patriots under Van der Mersch, over the Austrians.

TURNING, the art of shaping wood, metal, ivory, or other hard substances into forms having a curved (generally circular or oval) transverse section; and also of engraving figures composed of curved lines upon a smooth surface, by means of a machine called a *turning-lathe*. This art is of great importance and extensive application in mechanics, the most delicate articles of luxury and ornament, equally with the most ponderous machinery, being produced by it. The art of turning dates from a very early period, and Theodorus of Samos (about 560 B.C.) is named by Pliny as its inventor; but long before this period, the *potter's wheel* (see POTTERY), the earliest and simplest form of turning-machine, was in general use, as is evidenced by numerous references in Holy Writ. The immense variety of work performed by turning-machines necessitates great variations in their construction; but their mode of operation is always the same, and consists in fixing the work in position by two pivots or otherwise, causing it to revolve freely round an axis of revolution, of which the two pivots are the poles, and holding a chisel or other cutting-tool so as to meet it during its revolution, taking care that the cutting-tool be held firmly and steadily, and moved about to different parts of the work till the required shape be obtained. Lathes are divided, with respect to the mode of setting them in motion, into *pole*-lathes, *foot*-lathes, *hand-wheel* lathes, and *power*-lathes; with respect to the species of work they have to perform, into *centre*-lathes, which form the outside surface, and *spindle*, *mandrel*, or *chuck* lathes, which perform hollow or inside work, though this distinction is for the most part useless, as all lathes of good construction are now fitted for both kinds of work. *Bed*-lathes are those used by turners in wood, and *bar*-lathes for the best sort of metal-work; and the small metal centre-lathe employed by watch-makers is known as a *turn-bench.*

The primitive and most simple form of lathe for wood-cutting is the pole-lathe. It consists of two planks or beams placed horizontally side by side with a narrow space between them, which, being firmly supported at a convenient height, constitute the *bed*; of two uprights or *puppets* rising from the bed, one of them stationary at the left end, and the other sliding along over the slit between the beams, and capable of being fastened at any required point by a projecting tenon and wedge beneath; of a *treadle* below and parallel to the bed; and of an elastic *pole* or *lath* (whence some derive the name lathe) fixed to the ceiling above. This form of lathe is well adapted for turning long thin cylinders of wood, the piece to be turned being held fast at each end by the conical iron or steel point projecting from the inner face of each puppet. Motion is communicated to the work by a cord which is fastened to the lath overhead, wound twice or thrice round the work, and then attached to the treadle below. When the workman presses his foot on the treadle, the work commences to revolve rapidly, unwinding the cord towards the treadle, and winding it up on the side next the pole, causing the latter to bend considerably. During this period, the workman has been holding his cutting-instrument to the work; but after the treadle has been quite pressed down, he removes his foot, and the reaction of the bent pole causes the work to revolve in an opposite direction, till the pole has straightened itself; and during this latter revolution, no cutting is done. When the whole piece is to be turned, the cord must be moved from an unfinished to a finished part of the work. For the pole, an elastic steel bow and string are substituted when the work is light or fine, the cord being attached to the middle of the string, and the bow fastened to the ceiling by its centre. The advantage of the pole-lathe is, that it never acquires an impetus in the direction of the cutting motion, for whenever the pressure on the treadle is removed, the reaction of the pole takes effect; but the great waste of time during the straightening of the pole and rising of the treadle, has caused the abandonment of this machine for the foot-lathe. The foot-lathe, the most common and generally useful form of lathe, differs from the former in having a *head-stock* or *fast-head* in place of the left-hand stationary puppet. This head-stock, H H (fig. 1), consists of

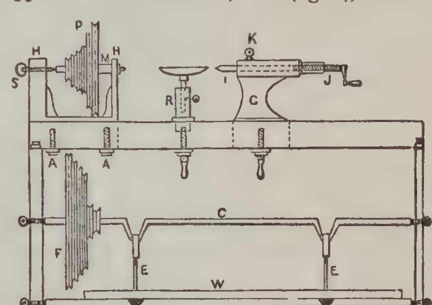


Fig. 1.

two supports or puppets firmly connected at their base, and fastened at right angles to the bed by means of the screws A, A; the outer puppet is pierced for the screw S; and the inner is supplied with a steel collar, within which the mandrel, M, which carries the speed-pulleys, P, turns. The left end of the mandrel is concave, so as to allow the steel point of the screw, S, to fit closely. R is a *rest*, which slides along the slit between the two beams of the bed, and may be clamped at any point, and elevated or depressed as is found necessary. The rest is used by the workman for leaning his cutting tool upon, in order to afford it greater steadiness. G is the right-hand puppet *front-head*, or *tail-stock*, movable along the slit in the bed, and capable of being fastened like the rest; its point, I, can be advanced or retired as required by means of the screw, J. C is the spindle, which, being connected with the treadle, W, by means of the rods or chains, E, E, turns the fly or foot wheel, F, and by means of an endless band connecting the latter with the speed-pulleys, communicates motion to the mandrel. The pulleys on the spindle and mandrel are of different

sizes, and so arranged, that when the endless band is placed on the left-hand pulleys, an extremely rapid motion is communicated to the mandrel, the motion being reduced more and more as the band is transferred more to the right, till, at the extreme right, the rotatory motion is much slower than that of the spindle. When the foot-lathe is required for centre-work, the inner end of the mandrel is furnished with a point similar to I; but when hollow or inside work is to be done, it must be armed with a screw, as in the figure. In this latter case, certain contrivances, known as *chucks*, for holding the work, are screwed on to the end of the mandrel. Some of these most commonly used are the *screw-chuck*, which shews on its right side a flat circular surface, from the centre of which projects a large, coarse, conical screw for holding firmly any large piece of wooden work; the *hollow chuck*, a strong circular cup with perpendicular sides, into which one end of the work is firmly fastened by a mallet, or, if too small, by four screws working inwards through its sides; the *drill-chuck*, of a cylindrical form similar to the last, but with a square cavity for holding drills, the instrument, and not the work, being made to rotate in this instance; and the *concentric chuck*, a most ingenious piece of mechanism—a flat plate with two slits almost to the centre, and in line of a diameter, within which slits works a spindle, with screw-ends carrying two steel studs, whose heads project through the slits above the surface on the right side; these heads carry two curved pieces, which serve as clamps to hold the work; and as the spindle-screws are of the same fineness, and with right and left threads, the revolution of the spindle either removes both further from the centre, or brings both nearer to it; hence, when the studs are once set at equal distances from the centre, they always remain so, and the work may be removed and replaced without danger of destroying the adjustment. All these chucks are of metal, and are mostly employed for heavy work; turners of wood or ivory preferring wood-chucks, which can be altered as required, and secured by an iron ring round the outside, to prevent splitting. The cutting-tools employed are very various: gouges are used to rough out the work—if soft wood—after which chisels with a straight oblique edge are employed: the instruments for harder materials, such as ivory or bone, are smaller than the former, and have their sharp edges 'better backed;' for inside-work, drills are first employed to make an opening, and then cutting-tools of various shapes are employed, according to the form which is wished to be given to

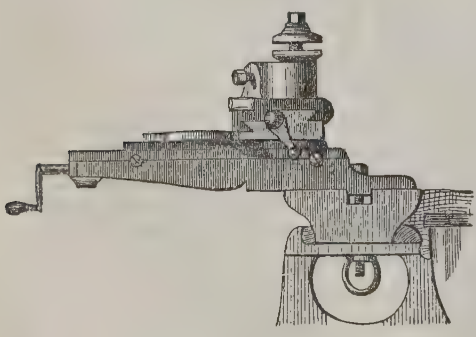

Fig. 2.—Slide-rest.

the interior surface. To avoid the imperfections in the workmanship arising from unsteadiness of hand in the workman, the *slide-rest* (fig. 2) is employed. This valuable addition is furnished with two motions, one towards the work, and the other along, parallel, or at any inclination to it, according as cylindrical or conical figures are required; there is a socket for the chisel, which is firmly held in its place by a screw; and after the slide-rest has been adjusted, the operator has only to move the rest forwards or sideways, as may be required, the motions being effected by two screws and winches.

The *hand-wheel* lathe is similar to the former, but so much larger as to require two workmen, one of whom is employed in setting the instrument in motion by turning a wheel, which corresponds to the wheel F in fig. 1. The *power*-lathe is similarly set in motion by horse, water, or steam power, and is employed for heavy metal-work, as piston-rods, iron columns of various kinds, wheels, artillery, &c. This machine differs from the foot-lathe chiefly in the substitution of rack-work, and wheels and pinions, for the endless band, and for manual labour, in the various adjustments of the machine, such as in moving forward the tail-stock, &c.; and in the mandrel being supported by both puppets of the head-stock. In wood-turning, the wood is first prepared by a hatchet and rasp, must be lightly though firmly pressed against by the cutting-tool; while metal-work must be cleaned from the sand of the mould or scales of the forge, and in turning, requires less care. Soft woods must be made to revolve with great rapidity; very hard woods and brass require much less velocity; wrought iron and copper, still less; steel, a further diminution of speed; and cast iron, the least velocity of all. After the work has been duly shaped, it requires to be polished; and this is effected while it is still in the lathe and rotating, by applying shark's skin to wood, pumice-stone and chalk to ivory and horn, and emery, tripoli, or putty powder to metals.

Hitherto, we have supposed that the axis of revolution of the work is fixed, and consequently that all work has been turned so as to present a transverse circular section; but many other forms of section may be easily obtained. The general mode of obtaining these non-circular figures is by screwing on to the mandrel an apparatus, by means of which the work can be thrown out of the centre of rotation at regular intervals; but as each different class of form requires a separate kind of apparatus, it is impossible here to describe the operations in detail. One species, however, known as *rose-engine turning*, and employed for producing involved curvilineal figures, such as appear on bank-notes and on ornamented gold, silver, or gilt work, is so peculiar and ingenious, as to call for more special notice. In this species, the standards which support the mandrel are no longer fixed at right angles to the bed, but are capable of oscillating backwards or forwards in a plane parallel to the plane of rotation of the mandrel, and are so acted on by a spring, that when pushed to one side they are at once restored to their former position on the pressure being withdrawn. Suppose, then, a metal wheel with its rim waved or indented, fastened concentrically on the mandrel, and the mandrel, pushed aside by a fixed steel point or roller, applied to the rim of the wheel; the reaction of the spring against the pressure of the roller will keep the latter in close contact with the waved rim throughout, and will produce a definite oscillatory movement of the mandrel, of the chuck, and the work fastened on it, and consequently—the cutting or graving tool being firmly held by the slide-rest—definite deviations from a circle in the lines marked on the face of the work. The wave-rimmed wheel, called a *rosette*, may be replaced by another, and that by a third, and so on till a sufficient number of different waved lines are obtained. A number of rosettes are generally

strung at once on the mandrel, and the fixed guide is brought into gearing by means of a steel band called a rudder, with one rosette after another. Similar concentric curves of greater or less perimeter are obtained by removing the slide-rest from, or bringing it nearer to, the axis of revolution.—For more complete information respecting this most interesting machine, and its many varieties of form and application, see article 'Turning' in the *English Cyclopædia*, Holtzapffel's *Turning and Mechanical Manipulations* (Lond. 1847—1852), and *Tourneur* (*Manuels-Roret*), by Valicourt (Paris, 1858).

TURNIP (*Brassica rapa;* see BRASSICA), a biennial plant, with lyrate hispid leaves; the upper part of the root becoming, especially in cultivation swollen and fleshy. It is a native of Europe and the temperate parts of Asia, growing in borders of fields and waste places. It is commonly regarded as a native of Britain, although in most cases of its being found apparently wild, it may be doubted if it has not derived its origin from cultivated varieties. It has been long cultivated, and is to be found in every garden of the temperate and cold parts of the world as a culinary esculent; it is also extensively grown in fields for feeding cattle and sheep. It was cultivated in India long before it could have been introduced by Europeans, and is common there in gardens and about villages. The cultivated varieties are very numerous. In them, the upper part of the root assumes a globose, oblong, or roundish depressed form. Some are common to the garden and the farm, and some of the largest kinds attain such a size as to weigh 20 or 25 lbs. Although the T. is of great value for feeding cattle, and the introduction of it into general field-culture was one of the greatest improvements ever effected in the husbandry of Britain, it is not very nutritious, no less than 90—96 parts of its weight actually consisting of water. Garden turnips are sown from the end of March to the end of August; field turnips generally in June, it being requisite that they should not be sown so soon as to incur a risk of their throwing up flower-stems in the first year, which, when it takes place, prevents in a great measure the swelling of the root, and renders it coarse and fibrous. In the garden cultivation of turnips, the root is generally intended for use in the first year. In dry weather, the plants are apt to throw up flower-stems, and so disappoint the hope of the gardener; which is also the case if the seed is sown too early in spring. Moist cloudy weather is most favourable. Garden turnips are sown, and allowed to grow, much closer than field-turnips; being gradually thinned out, and the thinnings used even when of small size. The varieties both of garden and field turnips are very numerous. The garden turnips are generally of comparatively small size, more rapid in growth, and more delicate.—The SWEDISH T., or RUTA BAGA, which was introduced into cultivation in Britain, from the north of Europe, more recently than the common T., and has proved of very great value to the farmer, is regarded by some botanists as a variety of the same species, and by some as a variety of *Brassica napus*, but more generally as a variety of *B. campestris*, a species common in corn-fields and sides of ditches in Britain and the north of Europe.

The cultivated T. grows best in a rich free soil. The mode of culture varies with the soil. Where the soil is light and dry, a smaller amount of ploughing, harrowing, and drilling is necessary than on stiff soils. The T. is not well suited to clay soils, although it is often grown on them. A complete pulverisation of the soil is requisite before the sowing of the seed. On light soils, a crop of turnips generally succeeds wheat or oats. T.-land is generally made up in raised drills, by the plough, and the seed is sown by the drilling-machine, on the top of the narrow ridges, which are about 27 inches apart. Small doses of guano, superphosphate of lime, crushed bones, or other such manures, produce great crops of turnips. They seem to act chiefly whilst the plant is young; and when it is further advanced, it derives nutriment from the soil, and even from the subsoil, by deeply penetrating roots, and from the atmosphere by its large leaves. See BONES AS MANURE. The young plants are thinned out by the hand-hoe, to a foot or upwards apart, and the ground is stirred and carefully kept clean by the plough or horse hoe. The T.-crop is thus of great use in clearing the land of weeds. In many places, part of the crop is eaten on the ground by sheep, which are confined to a small part of the field by means of movable fences. It is common to leave one of each three rows of turnips for this purpose, the other two rows being carried to the farmyard for feeding cattle, or stored. Turnips are stored either in a house, or in conical heaps, covered with their own leaves, or with straw and earth. They are sometimes protected from frost by being earthed up in rows by the plough. Some kinds are much more easily injured by frost than others; the Swedish turnips least of all.

The introduction of the T. as a field-crop is one of the most important events in the history of British agriculture. It has rendered possible a rotation of crops, which has been extremely advantageous, and has made the supply of butcher-meat more constant, by providing a supply of winter-food for cattle and sheep, whereas, formerly, all depended on the pasture. T.-husbandry was introduced into Scotland from Norfolk in the latter part of the 18th c., but soon attained a development, and was carried to a perfection in Scotland far beyond what it had previously reached anywhere. The climate of Scotland is particularly adapted to it, as is also that of Ireland; moist weather, both in summer and autumn, being suitable to the T.; whilst the climate of North America is so unfavourable to it, that it has not become an important crop there. Of late years, T.-crops in Britain have suffered very much from the disease called Anbury (q. v.), or *Fingers and Toes* This is not the case in Norfolk, and the exemption is supposed to be due to the use of clay-marl as a manure; but the whole subject is involved in obscurity. The T. not unfrequently suffers from a fungus of the genus *Botrytis* (*B. parasitica*), allied to that which is supposed to cause the potato disease. It infests plants of rank growth, attacking their roots, which are weakened by the too great luxuriance of the leaves. Plants weakened by drought are liable to suffer from a white mould, a species of *Oidium*, which attacks the leaves, and renders the plant worthless. The leaves are devoured by the T.-fly, T.-flea, or T.-beetle (*Haltica nemorum*), and by other species of the same genus. The Nigger Caterpillar, the larva of *Athalia spinarum*, also devours the leaves, as well as the caterpillars of White Butterflies (*Pontia brassicæ*, *rapæ*, and *napi*), and of some moths. The leaves are also mined by the larvæ of several dipterous flies. Several species of aphis suck the juices of the leaves, and one (*A. floris rapæ*) devotes its attention to the young crops in seed-leaf, which are also attacked by a rose-chafer (*Cetonia aurita*). and a minute beetle (*Meligethes æneus*). Slugs, snails, and wire-worms are among the enemies of the turnip.

The young leaves of the T. are good as greens

and particularly those of the Swedish T., when it has begun to sprout in spring.

TURNIP-CUTTER, an implement used for cutting turnips for cattle. It is useful, not only as saving the teeth of sheep, which are apt to be much injured by eating turnips, but as preventing waste, for sheep feeding upon turnips scoop out a part, and leave the rest to rot. The oldest and simplest turnip-cutter acts by mere pressure, and is like a large nut-cracker on a stand. Many kinds are now in use, of which perhaps the best are those having knife-edges on the surface of a cylinder or cone, which are brought to act on the turnips by turning a handle.

TURNIP-FLY, a name given to several insects destructive to turnips. It is often given to *Altica* (or *Haltica*) *nemorum*, also called TURNIP-FLEA, from its skipping or leaping powers, but which is truly a very small beetle, with long and strong hind-legs, and ample wings, of a shining black colour, with

Turnip-fly (*Anthomyia radicum*):
1, Maggot (magnified): 2, Pupa; 3, natural size: 4, Insect; 5, natural size.

two yellowish stripes down the wing-cases, and ochreous legs. It swarms in meadows and hedgerows in most parts of Britain from March to October, the larva feeding on many cruciferous plants. It often commits great ravages in turnip-fields, whilst the turnips are very young. The female lays her eggs on the under-side of the leaf, and the minute larva mines in the leaf, under the skin, making a tortuous gallery. Farmers sometimes steep the seed of turnips in order to prevent the ravages of this insect, but no good can be thus done, as the eggs are not in the seed.

The TURNIP-FLY, more properly so called, is *Anthomyia radicum*, a dipterous insect of the family *Muscidæ*, and of the same genus with the Cabbage-fly and Beet-fly. It attacks the root of the turnip, as the Cabbage-fly does that of the cabbage, the larva living in the root.

TURNIP SAW-FLY. See SAW-FLY.

TU'RNPIKE ROADS. See HIGHWAY, TOLL.

TURNPIKE STAIR, a turret stair revolving round a central newel.

TU'RNSOLE, a peculiar colouring material consisting of very coarse linen rags, usually pieces of sacking, prepared by cleaning and bleaching, and then dipped into the juice of the leguminous plant called *Crozophora tinctoria*, previously mixed with ammoniacal matter, and exposed to the air for some time. It is made in France, but is exclusively used in Holland, but for what is not certainly known: it is said, for colouring cheese, pastry, &c.

TU'RNSTONE (*Strepsilas interpres*), a bird of the plover family (*Charadriadæ*), very widely distributed, and, indeed, found in almost every part of the globe. It appears in Britain, chiefly as a winter bird of passage, but breeds in the Shetland Islands. It frequents the sea-shore, and derives its English name from its habit of turning over small stones with its bill in search of food. It is the only known species of its genus. The bill is longer

Turnstone (*Strepsilas interpres*).

than the head, conical, hard at the point; the neck short; the wings short, the tail short and pointed; the feet have a short hind-toe; the fore-toes are destitute of web. The whole length is rather more than eight inches. The upper parts are chestnut red, with black spots; the lower parts white, part of the neck and breast black.

TU'RPENTINE is a semi-solid resin which is yielded by various species of pine, and by some other trees when incisions are made into them. The chief varieties of turpentine are *Common Turpentine*, yielded by *Pinus australis; Venice Turpentine*, yielded by the larch; *Bordeaux Turpentine*, yielded by *Pinus maritima;* and *Chian Turpentine*, yielded by *Pistacia lentiscus.* The Venice turpentine, which is regarded as the best variety, occurs as a clear, transparent, pale yellow, viscous mass, of a balsamic odour, and an acrid bitter taste, perfectly soluble in spirits of wine, and increasing in density on prolonged exposure to the air. On distilling it with water, it yields a considerable quantity of essential oil, vulgarly known as *spirits of turpentine.* This *oil of turpentine* (which, from its greater cheapness, is usually obtained from common turpentine) is, after rectification, represented by the formula $C_{20}H_{16}$, and has a spec. grav. of 0·864, and a boiling-point of 320°. It is colourless, transparent, has a strong refractive power, a strong peculiar odour, and a disagreeable acrid taste. It is readily soluble in alcohol, in ether, and in the fixed and essential oils, but is insoluble in water, on which it floats. It is a good solvent for many substances, amongst which may be especially mentioned sulphur, phosphorus, caoutchouc, and the various resins; and is largely used in many departments of the arts, forming a large proportion of all oil paints. Great quantities are produced in North Carolina and other Southern States, mostly derived from *Pinus australis* and *Pinus tæda.*

Turpentine is an energetic producer of Ozone (q. v.); and on keeping it for a long time in a stoppered flask, which should be occasionally shaken, the odour of ozone is very distinct on opening the vessel. Oil of turpentine forms three hydrates, of which two are solid. Commercial oil of turpentine often consists of a mixture of several isomeric hydrocarbons which act oppositely on polarised light (like the several varieties of sugar). Deville and Berthelot have ascertained that there are various modifications of which this oil is susceptible without its undergoing any change in its chemical composition. Of these, *isoterebenthene* and *metaterebenthene* differ *inter alia* in their boiling-points, and may thus be separated; *terebene* (which has an odour resembling that of oil of cloves) and *colophene* are obtained by acting on the oil with sulphuric acid.

and *camphilene* and *terebilene* by decomposing artificial camphor (which is a combination of the oil with hydrochloric acid) by means of quicklime.

Under the influence of nitric, hydrochloric, and sulphuric acids, chlorine, &c., oil of turpentine yields many products of interest to the chemist, but as yet of little practical value.

Oil of turpentine is used to a considerable extent in medicine, although, from its disagreeable taste, and from certain bad effects which occasionally follow its use (as strangury, bloody urine, vertigo, a species of intoxication, and an eruption on the skin), it is often supplanted by less certain remedies. It is probably the most effective remedy for the expulsion of tapeworm, is nearly equally efficacious over the lumbrici or round-worms, and in the form of an injection is serviceable in the case of ascarides or thread-worms. For an adult, in a case of tapeworm or round-worm, the dose should be one ounce, combined with an equal quantity of castor-oil, or made into an emulsion with yolk of egg or mucilage. In the case of children and delicate women, it is better to try a milder vermicide (see VERMIFUGES). In doses of from two drachms to two ounces, and in similar combination with castor-oil, it may be given as a cathartic in cases of obstinate constipation, especially when dependent on affections of the brain; in hysteria, epilepsy, tympanitis, passive hæmorrhage, and in purpura hæmorrhagica, in which last-named disease Dr Neligan highly recommends it. In small doses (as from 10 to 20 minims), oil of turpentine is regarded as a diuretic; but it must be given with caution, in consequence of its stimulating properties. It is of more service in chronic mucous discharges of the genito-urinary organs, as gleet, leucorrhœa, &c., than in dropsy. In small doses, it is often useful in chronic rheumatism and in sciatica. In the Dublin school, it is much employed in small and repeated doses as a general stimulant in the low stages of continued fever. *Turpentine Punch* has long been a favourite remedy in the Meath Hospital (where Graves and Stokes made their reputation) in these cases. It is composed of an ounce of oil of turpentine, two ounces of brandy, eight ounces of boiling water, and a sufficient quantity of sugar. A third of this should be taken for a dose, and should be repeated if necessary every third hour. When applied externally, oil of turpentine is a speedy and powerful rubefacient and counter-irritant, and is beneficially used in this capacity in inflammatory attacks of the throat, chest, and abdomen. The best method to pursue is to rub the oil by means of a bit of flannel over the part to be acted on; over this to lay three or four folds of flannel, wrung out of hot water, and over the flannel to place a dry towel; two or three such applications produce a sufficient result. There is a *Liniment of Turpentine* which is powerfully stimulating, and is applied as a dressing for extensive burns; and is likewise used, with friction, in rheumatic and neuralgic cases. There is also the *Liniment of Turpentine and Acetic Acid*, which is the officinal representative of the well-known *St John Long's* liniment, and is an excellent counter-irritant (applied with a sponge) in pulmonary consumption and other chronic pulmonary affections. Lastly, *Ointment of Turpentine*, a warm stimulating application, requires mention.

It was mentioned at the beginning of this article that on distilling turpentine with water, the oil comes over. The residue left in the retort constitutes common *resin* (or *rosin*), known also as *colophony*. See RESINS.

TURPENTINE TREE. See PISTACIA.

TURPIN Archbishop of Rheims, friend and companion of Charlemagne, and eye-witness of the exploits he relates—such are the names and qualifications assumed by the author of a chronicle in Latin prose narrating the expedition of the Frankish emperor against the Saracens of Spain, and particularly the events that preceded and followed the battle of Roncesvalles (q. v.). That a Bishop Turpin existed about this period, is admitted, but the very documents in which he is mentioned, state that he was slain at Roncesvalles. There was also an Archbishop Turpin of Rheims (753—800 A. D.), but he has no claim to the description given above; and, in fact, all internal evidence leads to the conclusion that it is a work of the 11th century. It seems to have sprung out of the epic ballads and traditions of the Carlovingian heroes, while these were still in a comparatively pure condition; but through the legendary manner in which they are told, there is visible a monkish aim—viz., to encourage the foundation of churches and monasteries, the undertaking of religious wars against the Saracens, and above all, the pilgrimage to San Jago de Compostella. Now, as in the year 1190, a brother of the Archbishop of Vienne (subsequently Pope Calixtus II.) obtained by marriage the countship of Galicia; as it was from Vienne that the pseudo-Turpin's chronicle was recommended to the rest of Christendom; as the same archbishop was detected on several other occasions fabricating false documents; as subsequently, in his quality of pope, he himself pronounced the chronicle authentic in a bull of 1122 (the authenticity of which has, however, been questioned); as he pursued the same family policy in his acts as pope, and in his sermons in honour of San Jago; finally, as the chronicle of the pseudo-Turpin is very often followed in the MSS. by a dissertation of Calixtus upon the miracles of San Jago, it has seemed to critics highly probable either that Pope Calixtus wrote the work himself, while yet Archbishop of Rheims (*circa* 1090), or, at least, that he took an important part in its composition. The book soon acquired a great popularity, was translated into French after 1206, and was made use of by divers chroniclers, as the author or authors of the *Chroniques de Saint-Denis*, Vincentius Bellovacensis, &c. The chronicle is of great historic value, in spite of all the embellishments it has from time to time received; for, as one of the most ancient traditions of the time of Charlemagne, it has preserved numerous traits and details with more purity and fidelity than the poems of the Carlovingian cycle, which are generally of later date. The chronicle has been printed in Reuberus's edition of the *Scriptores* (Hanau, 1619; Frank. 1726), but see more particularly Ciampi's *De Vita Caroli Magni et Rolandi Historia, J. Turpino vulgo tributa* (Flor. 1822).

TU'RPIS CAU'SA, a phrase in the Law of Scotland borrowed from the Roman law, to express an immoral consideration on which some contract or obligation is founded. The rule is, that when an immoral contract is broken, no court of law will assist either party to enforce it. Thus, if a man were to let lodgings to a prostitute, with the knowledge that the lodgings were to be used for carrying on her vocation, he would have no right to bring an action to recover rent.—The same is the rule in English law.

TURQUOISE, a mineral hitherto found only in the province of Khorassan, in Persia, and much prized as an ornamental stone. It is essentially a phosphate of aluminium, containing also a little oxide of iron and oxide of copper. It is harder than felspar, but softer than quartz, and has a greenish-blue colour. It is opaque, or sometimes

translucent at the edges. It is sometimes called Oriental T.; whilst the name Occidental T. is given to a substance of similar colour, found near Simon, in Languedoc, which is said to be merely bone coloured with phosphate of iron.

TURRET-SHIP, an invention of the last few years in naval warfare, consists of an iron-plated vessel rising but slightly above the water, with bulwarks which, by means of hinges, can be lowered out of the way of cannon shot. In the middle of the deck are one or more turrets encased in the most massive plates, and holding each one or two guns of heavy calibre. The turret, in American vessels, is pivoted on the keel or other firm base; in English specimens it revolves on rollers under the periphery. By means of simple mechanism, it can be made, either by a steam-engine or by hand, to revolve with considerable speed, thus giving the gun a range in every direction. Turret-ships were first proposed by Capt. John Ericsson, of New York, in 1854, but were claimed by and patented in Great Britain by Captain Cowper Phipps Coles of the royal navy, who, after much discussion with the Admiralty, was allowed to adapt the *Royal Sovereign*, a wooden vessel which had been built for a three-decker, to his designs. The plan was tried under disadvantages, as the ship had not originally been destined for such heavy work. Notwithstanding, the *Royal Sovereign*, as a turret-ship, has been

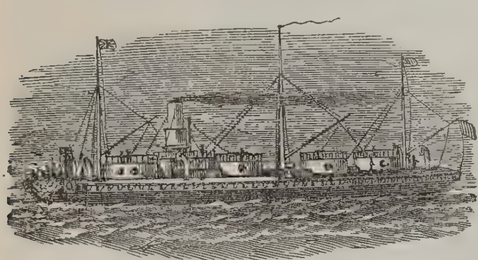

Fig. 1.—Turret-ship, *Royal Sovereign*.

declared by competent officers to be the most powerful vessel in the British navy. A turret of this vessel was subjected in June 1866 to a tremendous test by being repeatedly fired at, from a short distance, by a very heavy gun. The iron-plating was damaged, especially at the embrasure; but the turret was found, its concussions notwithstanding, to revolve with the same ease as before the trial. Almost simultaneously in the United States, similar vessels, called 'Monitors,' sprang into

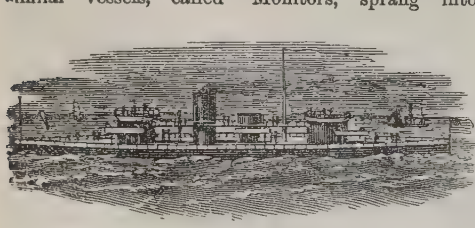

Fig. 2.– American Turret-ship, *Miantonomah*.

existence, the principal point of difference between them and the British build being that their hulls are almost entirely submerged, the turrets being wholly above the upper deck; while, in the latter, the hulls rise higher from the water, and the turrets are sunk below the deck, except in so far as is absolutely necessary for discharging the ordnance. It has for several years been in dispute whether to trust to turret-vessels or to ships with their battery in broadside. Under the administrations of Lords Palmerston and Russell, the Admiralty have built broadside vessels. Lord Derby's government signalised their accession to power in 1866 by immediately ordering four iron turret-ships of immense power and 4000 tons each.

Among the advantages claimed for turret-ships

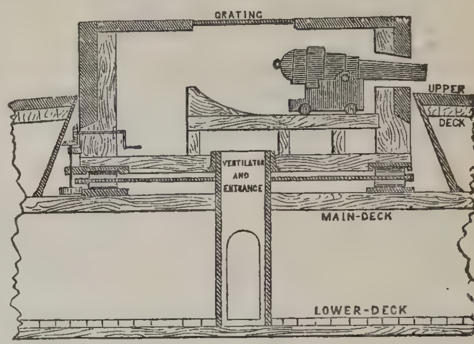

Fig. 3.

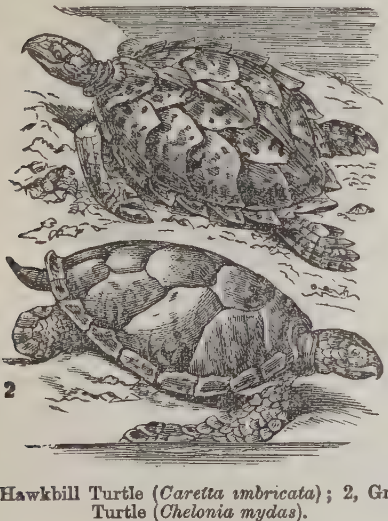
are—that much heavier ordnance can be carried centrically than at broadside, with equal dislocating pressure on the keel; that in a sea the platform from which aim is to be taken is steadier at the centre; that the mark offered to the enemy is smaller; and that the gunners are safer, as the turret can be turned with its port-hole away from the enemy during loading. The turret-ship "Captain," regarded by the English Admiralty as a perfect armoured ship, was constructed on the plan of Capt. Coles. But the vessel was top-heavy, and overturned in a storm, and Capt. Coles and 500 of his comrades perished. See Norton and Valentine, Rep. on *The Munitions of War, Paris Exhibition*, 1867, Washington, 1868.

TURRITE'LLIDÆ, a family of gasteropodous molluscs, having a much elongated spiral shell, the lower spires remarkably separated. The name Turret-shell is often given to them.

TURTLE, the popular name of those Chelonian reptiles, the family *Cheloniadæ* of some, which have a rather flat carapace, and fin-like paddles instead of legs, suited for swimming, and not for walking. The fore-limbs are much longer than the hind-limbs. The toes are not all furnished with nails; in some species, there is only one on each foot, in others there are two. Turtles are all marine, and although they lay their eggs on the beach, seldom visit the shore for any other purpose. They deposit their eggs in holes, which they scoop in the sand with their hind-feet. The eggs are numerous, one hundred and fifty or two hundred being often deposited at a time, and the T. lays several times a year. The young, soon after being hatched, make their way through the sand which covers them, and immediately betake themselves to the water. The eggs are hatched by the heat of the sand alone, and the young receive no attention from their parents. Turtles crawl slowly and awkwardly on the shore; but their movements in water are comparatively quick, and even graceful. Some of the species feed entirely on grass-wrack and sea-weeds, which their powerful, hard, and sharp-edged jaws cut with great ease: others prey on crustaceans, molluscs, and fishes. Their jaws are powerful enough to crush very large shells, and the carnivorous turtles are in general more rapid in their movements than the

others. The flesh of those which subsist on animal food is musky and unpleasant; but that of the species whose food is vegetable is much esteemed. In many tropical countries, turtles, after being captured, are kept in enclosures to which the tide has access, to be killed when they are wanted. They are capable of subsisting long without food, and are imported alive from the West Indies into Britain, to supply the tables of the wealthy. In tropical countries, turtles are often very cheap. Their eggs are a much-esteemed article of food in the countries where they are found, and are sought for by probing the sand with a light stiff cane in the places known to be frequented by turtles. Turtles are easily taken when they come ashore for the purpose of laying their eggs, and one after another may be turned on its back—in which position it is helpless, and cannot make its escape—till a sufficient number is secured. They are also, however, taken in the sea, being cautiously approached by boats when resting, or apparently sleeping, at the surface, or by divers when descried at the bottom in their feeding-grounds. A small harpoon is used, or a rope is thrown over the head of the turtle. Turtles are sometimes pursued by boats in shallow parts of the sea until they are exhausted, the clearness of the water permitting them to be seen even when they dive; and when the boat gets near enough, a man leaps overboard, and seizes the T., clinging with both hands to the shell. It is said that at Mozambique a species of sucking-fish (*Echineis*) is used for catching turtles, a cord being attached to the fish, which is allowed to swim away in the sea, and is sure to fasten itself firmly to the first T. it meets.

The most esteemed T. of the West Indies is the Green T. (*Chelonia mydas*), which is the only kind imported into Britain for aldermanic and other feasts. The Green T. attains a large size, being sometimes six or seven feet in length, and weighing 700 or 800 lbs. The plates of its carapace do not overlap one another; the central ones are almost regular hexagons. The popular name is derived not so much from the external colour, which is mostly a dark olive, passing into dingy white, as



1, Hawkbill Turtle (*Caretta imbricata*); 2, Green Turtle (*Chelonia mydas*).

from that of the fat, so much prized by epicures.—Another excellent species of T. is the Edible T. (*Chelonia virgata*) of the East Indies, which is frequently four or five feet long.—The Hawkbill T. (*Caretta imbricata*), found in the warmer parts of the Atlantic Ocean, in the Indian Ocean, and in the Red Sea, is particularly valuable, as yielding the best Tortoise-shell (q. v.). It is one of those turtles which have the plates of the carapace imbricated, or overlapping one another like tiles. Its flesh, although not so much esteemed as that of the Green T., is a good article of food; its eggs are also very good.—There are other turtles, having the head of a larger size, and the jaws curved towards one another at the extremity, of which one is the Loggerhead T. (*Caouana olivacea*), a native of the warmer parts of the Atlantic, and a very rare visitant of the British seas. Others, again, have the carapace and plastron not hard, but leathery, and sometimes soft enough to yield to the pressure of the finger. One of these is the Coriaceous T. (*Sphargis coriacea*) of the Mediterranean and Atlantic, occasionally, but rarely, found even on the British shores. It attains a very large size, even greater than any of the species already described, but its flesh is coarse and unpleasant.

The French, encouraged by their success in pisciculture, have attempted to introduce the Green T. on the southern coasts of France. There has not yet been time to prove the success of the experiment.

TURTLE-DOVE, or TURTLE (*Turtur*), a genus of *Columbidæ*, having the bill more slender

Turtle-dove (*Turtur communis*).

than pigeons, the tip of the upper mandible slightly bent down. They are also more slender and elegant in form than pigeons, and generally smaller; the wings are longer and more pointed; and the tail is longer, rounded, or slightly graduated. There are numerous species, natives of warm climates. Their soft and gentle, yet loud *cooing* has attracted attention even more than their beauty, and made them a favourite subject of allusion in poetry. *T. risorius*, the most common species in Palestine, and probably the one intended in the Song of Solomon, is about ten inches in entire length, with a short tail; the general colour gray tinged with red; the upper parts greenish brown, with a black collar on the back of the neck. It is often kept in confinement, and becomes very tame.—Very similar to this in size and form is the Common Turtle-dove (*T. communis*), a native of almost all the warmer parts of the Old World, a summer visitant of the south of Europe and of England, where it is chiefly found in the south-eastern counties. In Kent, flocks of twenty or more are often to be seen, particularly in the pea-fields. The tail is long, and much rounded; the plumage soft, and without gloss, exhibiting finely-mingled tints of gray and brown; the crown of the head bluish; all the tail-feathers tipped with white; a black patch on each side of the neck. Other species of turtle-dove, from different parts of

the world, as well as these, are not unfrequently kept in confinement, and are very gentle, if not very intelligent pets. Their cooing resounds through a whole house.

TU'SCAN ORDER OF ARCHITECTURE, one of the five Classic Orders (q. v.), being a Roman modification of the Doric style with unfluted columns, and without triglyphs. It is the simplest of the orders.

TU'SCANY, formerly a sovereign grand duchy in the west of Italy, lying for the most part, but not wholly, south and west of the Apennines, in lat. 42° 20′—44° 10′ N., and long. 10° 15′—12° 20′ E. Area, 8440 sq. m.; pop. in 1860, at the date of its annexation to Sardinia, 1,800,000. The north and north-east of the country is filled with mountains, whence numerous rivers and streams flow down to the sea, the most important of which are the Arno (q. v.), the Serchio, and the Ombrone. This district is also the source of the Tiber (q. v.). The rest of T. is an undulating region of hills and dales, except the coasts, which are flat and marshy. Of these marsh-lands, the largest is (or was) the *Maremma* (q. v.). The principal crops are maize, wheat, rye, and barley. Wine and oil are also abundantly produced. Mules, cattle, and sheep are reared in great numbers; there are flourishing manufactures of silks, woollens, and straw (for hats); and a very considerable trade is carried on in articles in marble, alabaster, porcelain, coral, wax, &c. The chief town, Florence, was the capital of Italy prior to 1871. Other important places are Leghorn, Pisa, Siena, and Arezzo.

The ancient history of T. is described at length in the article ETRURIA, and its medieval history in the article FLORENCE. It is only necessary to add, by way of elucidation, that modern T. was first constituted in its present dimensions in 1569, when Cosmo de Medici became Grand Duke of Tuscany. On August 16, 1860, the national assembly of T. pronounced the deposition of the reigning dynasty; and four days later, declared for annexation to Sardinia.

TUSCARO'RAS, a tribe of North American Indians, who, at the settlement of North Carolina, had 15 towns on the Tar and Neuse rivers, and 1200 warriors. In 1711, they began a war with the settlers, and after a series of savage encounters, were defeated, and joined the Iroquois in New York, where they became allies of the English, and where about 50 families still reside on an Indian Reservation in the western part of the state.

TU'SCULUM, anciently a city of Latium, about 15 miles south of Rome, was situated on a ridge of hills known as the *Colles Tusculani*, and forming part of the Alban range. We ought not to infer from its name (as Festus does, *s. v. Tuscos*) that it had any connection with the Etruscans. Mythically, it derived its origin from Telegonus and Circe; but we catch the first certain glimpse of its historical existence towards the close of the regal period at Rome. Then, however, it appears in the enjoyment of a high degree of prosperity and power, and therefore its beginnings are in all probability remote. Octavius Mamilius, ruler of T., and the foremost prince in Latium, married a daughter of Tarquin the Proud (see TARQUINIUS), and played a conspicuous part in the last of the great struggles made by the banished tyrant to regain his kingdom. On that occasion, the Latins were so thoroughly beaten (see REGILLUS LAKE) that they were fain to enter into an alliance with the victor, and ever after —except in the single instance of the Great Latin War (340—338 B. C.)—remained steady in their attachment and fidelity to Rome. As early as 378 B.C., the inhabitants of T. received the Roman franchise, and among its many distinguished *gentes* may be specially mentioned the Porcian, which produced two famous men of a thoroughly 'Roman' stamp, Cato *Major* and Cato *Minor*. Towards the close of the Republic, T. became a favourite country residence of the wealthy Romans. Lucullus had a villa here (with parks and gardens extending northwards for miles); so had Cato, Brutus, Hortensius, Crassus, Cæsar, and Cicero. The villa (*Tusculanum*, Tusculum House) of the great orator is peculiarly memorable as the place where he composed many of his philosophical works, and particularly those charming dialogues (*Tusculanæ Disputationes*) which derive their name from it. Long after the Western Empire had fallen, T. continued to flourish. As late as the 12th c., the ancient city continued entire; but in 1191 it was stormed by the Romans (between whom and the Tusculans there had long been a deadly feud), and razed to the ground. It never recovered from this blow; but lower down there arose from its ruins, if we may so speak, the town of Frascati (q. v.). Many fine remains of ancient T. have been dug up in recent times, the most remarkable, perhaps, being the amphitheatre, theatre, and city walls.

TU'SSAC GRASS (*Dactylis cæspitosa*), a large grass of the same genus with the Cock's-foot Grass of America, a native of the Falkland Islands, remarkable for forming great tufts, sometimes five or six feet in height, the long tapering leaves hanging over

Tussac Grass (*Dactylis cæspitosa*).

in graceful curves, from five to eight feet long, and an inch broad at the base. It is, however, sufficiently delicate to be very good food for horses and cattle; and the attention of British farmers having been very strongly called to it, it has been tried with success in the Hebrides, Orkney Islands, and other localities in which there is a peaty soil exposed to winds loaded with sea-spray, to which it promises to be a very valuable acquisition. The inner part of the stem, a little above the root, is soft, crisp, flavoured like a hazel-nut, and often eaten by the inhabitants of the Falkland Islands. The young shoots are boiled and eaten as asparagus.

TUSSILA'GO, a genus of plants of the natural order *Compositæ*, sub-order *Corymbiferæ*, having

bracteæ with a membranous edge, a naked receptacle, a hairy pappus; the florets of the ray pistilliferous, in many rows, tongue-shaped; those of the disc perfect, few. *T. farfara*, sometimes called COLT'S-FOOT, is found in New England and New York. It has single-flowered scaly scapes, appearing before the leaves in early spring, the flowers yellow, both disc and ray; the leaves heart-shaped, angular, downy beneath. The leaves have a somewhat glutinous

Colt's-foot (*Tussilago Farfara*).

and subacrid taste, and are used either by smoking, or in the form of a decoction, for relief of asthmas and troublesome coughs. They have been used with advantage in scrofula.—Nearly allied to this genus is *Petasites*, of which one species, the BUTTER BUR (*P. vulgaris*, formerly *Tussilago Petasites*), is a native of Britain. The leaves resemble those of *Tussilago Farfara*, but are much larger; the flowers also appear before the leaves, but in a dense thyrsus, and are of a pale flesh-colour. The flowers of both are much sought after by bees, as are those of *Petasites* (formerly *Tussilago*) *alba*, and *P.* (formerly *T.*) *fragrans*, natives of the south of Europe, not uncommon in British flower-gardens.

TU'SSOCK MOTH (*Laria pudibunda*), a grayish-white moth, about an inch long, the upper wings freckled, with four irregular darkish lines, the under

Tussock Moth and Caterpillar.

wings nearly white. The caterpillar does great mischief in hop plantations, and is known by the name of *Hop-dog.*

TUTOR, in the Law of Scotland, means a guardian of the person as well as of the estate of a boy under 14, or a girl under 12; that is, while they are in a state under that of puberty. At common law, a father is both tutor and curator of his children. Tutors are divided into three kinds: tutors nominate, tutors at law, and tutors dative. A tutor nominate is he whom the father, who has the sole power of naming a tutor, has appointed by will or deed. Sometimes several are appointed to act jointly. In general, no security is required from a tutor nominate, because the father's choice implies that the tutor is a trustworthy person. Yet, if he is *vergens ad inopiam*, or of doubtful character, security will be required. Tutors at law are those whom the law will appoint in a certain order of relationship, if there is no tutor nominate. No cognate, i.e., no relation by the mother's side, will be appointed; but the nearest agnate, i.e., a person related through the father, will be appointed, if a male, and of the age of 25, and able to give security. The tutor, however, has only the custody of the pupil's estate, while the custody of the pupil's person is given to the mother or nearest cognate. A tutor dative is named by the crown when there is no tutor nominate or tutor at law. Tutors other than tutors at law have the custody of both the person and estate of the pupil, and act alone for the pupil, suing for and discharging all debts due, and managing the property. The tutor's office is gratuitous, and he is not allowed to derive any profit from it, or to do acts inconsistent with his duty. For some purposes, however, such as selling the pupil's land, he must have the sanction of the Court of Session. He is bound, on entering office, to make up an inventory, and must keep proper accounts.

TU'TTLINGEN, a town of Würtemberg, on the right bank of the Danube, 20 miles west-south-west of Sigmaringen. It has manufactures of knives, needles, cloth, cotton, hosiery, linen, and silk, and carries on besides some trade in corn. Pop. 7031. T. is historically notable as the scene of a battle in 1643, during the Thirty Years' War, in which an Austro-Bavarian force, under Hatzfeld and Mercy, defeated the French.

TUTTY-POWDER, an impure oxide of zinc, which is found in the chimneys of the furnaces in which the ores of that metal are roasted. It has some value in medicine.

TUTUI'LA, an island in the Pacific, belonging to the group of the Navigators' or Samoan Islands (q. v.), is about 17 miles long and 5 miles broad, and is said to contain nearly 5000 inhabitants. The coast is bold, and the island is traversed by sharp-peaked mountains, highly picturesque in outline, and rising to from 2500 to 3500 feet. The harbour of Pago Pago, an ancient crater, is very deep, and completely landlocked by lofty mountains. The mountains are clothed with dense green forests, comprising the bamboo, banana, cocoa-nut tree and other palms. Between the months of November and May, fearful hurricanes break over the island, and so powerful is their effect, that they are said by the natives to *skin the land.*—*Cruise of H.M.S. Fawn*, by T. Hood (Edmonston and Douglas, Edin. 1863).

TU'YERE, the nozzle or small pipe through which the air is forced into a blast-furnace.

TVER, a government of Great Russia, bounded on the N.-W. by the government of Novgorod, and on the S.-E. by those of Moscow and Smolensk. Area, 26,031 sq. m.; pop. 1,518,077, mostly Russians. In configuration, the government is an elevated table-land, forming part of the Valdaï plateau, which

throws off rivers that run north-west into the Baltic, and south-east into the Caspian Sea respectively. The chief rivers are the Volga, with its affluents, the Tvertza and the Mologa; the Western Dwina, the Msta, and the Tsna. Most of these rivers rise in the north-west of the government, where there are numerous lakes. The climate is somewhat severe; the soil is not fertile, the most of the government being in marshes, and in woods and tracts of turf, the working of which, however, is as yet insignificant. Rye and oats are the only cereals produced with success. The employments of the inhabitants are principally agricultural; but other modes of industry are gradually developing themselves, especially along the great commercial highways of the government; 50,000 men are employed in the lake-fisheries, which are important, and in the conveyance of goods.

TVER, a city of Great Russia, capital of the government of the same name, stands at the confluence of the Volga with the Tvertza, 348 miles south-east of St Petersburg, by the St Petersburg and Moscow Railway. The Volga, which is here wider than the Thames at London Bridge, becomes first navigable for steamers at this town, although there is much difficulty in accomplishing the voyage hence to Nijni-Novgorod, when the water is low. Among the important buildings of T. are 2 monasteries, 23 churches, and 47 factories of different kinds, of which the chief is the cotton-mill of Kaoulin and Zologin, in which 1500 people find employment. Nail-making is an important branch of industry. The situation of T. is very convenient as a landing-place, in consequence of the St Petersburg and Moscow Railway here meeting the Volga, the principal artery of the commerce of the interior of Russia. The commercial prosperity of the town is continually increasing. Cereals and iron brought from Siberia are the chief articles of commerce, and besides the articles already mentioned, linen, leather, and paper are largely manufactured. Pop. about 30,000.

TWEED, the most famous of Scottish rivers, rises in the extreme south of Peeblesshire, at an elevation of 1500 feet above sea-level. It flows north-east to near Peebles, thence east by south to its junction with Ettrick Water, and thence in an easterly and finally north-easterly direction to its embouchure in the North Sea at Berwick-on-Tweed. The river drains great part of Peeblesshire, traverses the northern districts of Selkirk and Roxburgh shires; and in its lower course it forms the boundary between Berwickshire on the north-west and the English border-land on the south-east. It receives the Ettrick, the Teviot, and the Till from the south; and the Gala, Leader, and Adder from the north. The T. passes Peebles, Innerleithen, Melrose, Dryburgh Abbey, Kelso, Coldstream, and Berwick, where it falls into the sea after a course of 96 miles, and having drained an area estimated at 1870 sq. m. —greater than that of any other Scottish river, except the Tay. The highest regions through which the river flows are for the most part of the nature of moors; the middle course of the river is through narrow valleys, flanked by hills, clothed with woods or in pasture; and its lower course, through widespread valleys, picturesque and beautiful, and through the rich plain of the Merse (see BERWICKSHIRE), has many attractions. The tide is felt at Norham Castle, ten miles from the mouth of the river; but there is little or no navigation above Berwick. Possibly the T. owes its fame more to the associations which connect themselves with it, than to the charms of the scenery through which it flows. Traversing the heart of the 'Borders,' it has been witness to many a foray between the warrior-farmers north and south of its banks, as well as many a deadly struggle between the rival Houses of the south of Scotland; and its name is frequent in ballad and story. The T. is famous as a salmon and trout stream.

TWEEDMOUTH. See BERWICK-ON-TWEED.

TWEEDS, a name given to a certain kind of woollen cloth, largely made at Galashiels, Hawick, Selkirk, Jedburgh, and a few other places on the Tweed and its tributaries. It is prepared chiefly for men's apparel, and is of an open, soft, flexible nature—differing from English superfine cloth in not being so finely spun or closely woven, but most of all in not being so thoroughly felted. Tweeds are further characterised by their purity of colour and genuineness of make—shoddy, mungo, and cotton-warp not being yet used in the production of even the cheaper kinds. It is a manufacture of comparatively recent date. Seventy-five years ago, Galashiels, a principal seat of the manufacture, was only a small village; its few weavers individually manufacturing a species of coarse woollen cloth called 'Galashiels gray,' made from wool grown on the surrounding hills. About forty years later, the fabric was so far improved, that its use was no longer confined to the Border shepherds, but it had begun to be more or less worn by all classes in towns. The warmth, comfort, and durability of tweeds, as well as their suitability for all seasons, gradually led to their being preferred to the hard tartans, Manchester linens, and Nankeens of former days; and eventually, even to English doeskins. The demand for them rapidly increased. Galashiels has become a considerable town, and many large mills are now in active operation on the Tweed and its 'waters,' although they have for many years ceased to furnish power enough for the machinery. Nor has the manufacture confined itself to Tweedside, but has spread northwards to Aberdeen, Elgin, and Inverness; and southwards to Dumfries, and into Cumberland.

The wools used in the production of tweeds are principally Cheviot, South American, and Danish, for the coarser kinds; and Australian, New Zealand, and Saxony for the better qualities. Both fleeces and lambs' wool of the various kinds are employed—frequently in the proportion of two parts of the former to one of the latter.

The processes of spinning and weaving are similar to those adopted for English woollen cloth, the machinery, in fact, being, in the main, exactly the same. Tweed yarns are dyed before being woven, as their different colours are essential in giving variety to the patterns. Sometimes three or four colours are spun or twisted into one thread. Power-looms are employed in weaving, with, of course, the necessary mechanism for producing the great variety of patterns which is characteristic of the trade. As has been already said, the chief difference between broadcloth and tweeds, irrespective of pattern, arises from the milling, which, in the case of the latter, only occupies a few hours; but with the former, is prolonged for two or three days. The result is that the broad-cloth is so completely felted that the surface betrays no appearance of weaving; but in tweeds this can usually be distinctly seen.

Tweeds were at first all shepherd checks; but they are now made into many different kinds of checks and stripes, as well as plain styles; besides an endless variety of mixtures known under the general name of fancy tweeds. This manufacture, now one of the great staples of Scotland, seems to be rapidly increasing. The following figures exhibit the

advance made in Scotland in the manufacture of fabrics of this class from 1851 to 1862:

	1851.	1862.
Number of Factories,	72	82
" Power-looms,	329	1069
Sets of Carding-engines,	225	305
Value of Goods made, about	£600,000	£1,600,000

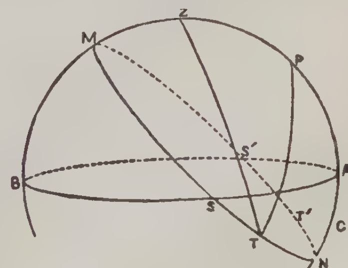
The Jury Report on the woollen goods exhibited in the International Exhibition of 1862, remarks: 'To the Scotch manufacturers belongs the credit of having found out what the public like, and of having led for a considerable period the public taste. So largely have their productions been imitated on the continent, that many of the choicest fancy trouserings of France and other countries are easily traceable in design and colouring to their Scotch origin.'

TWELFTH-DAY. See BEAN-KING'S FESTIVAL, and EPIPHANY.

TWELVE TABLES (Lat. *Lex* or *Leges Duodecim Tabularum*), the name given to the earliest code of Roman law. According to the ancient account, the code originated in this wise: In the year 462 B. C., a tribune, C. Terentilius Arsa, brought forward a proposal to appoint five men to draw up a set of laws, with the view of limiting the *imperium* of the consuls. The aristocracy, always furious, selfish, and unwise in their struggles with the commons of Rome, violently resisted this reform, and for eight years a fierce parliamentary warfare—if we may so call it—was carried on between the two orders, which ended in a sort of partial victory for the plebeians; that is to say, in 454 B.C., the senate assented to a *Plebiscitum* (see PLEBISCITE), in virtue of which three commissioners were despatched to Greece to report on the laws in force among the different states there. After a lapse of two years, they returned; and it was then agreed that ten men (*decemviri*) should be selected to draw up a code (*legibus scribundis*); but the patrician or aristocratic party took care that these decemvirs should all be chosen from their body. The story of the political fortunes of the Decemviri (q. v.), and of the fate of the leading decemvir, Appius Claudius (q. v.), are well known, though we believe that it has not come down to us in a very historical dress; indeed, it is politically quite unintelligible in the main. But what concerns us here is not the political career of these men, but the character of the legislation ascribed to them. We say ascribed to them, for the whole story of the foreign travels of the commissioners, and of their eclectic procedure in the matter of the Solonian and other laws, is so completely at variance with the simple, narrow, *home-centred* feelings of the Roman people at that early time, and with the thoroughly *Italian* stamp of the legislation embodied in the 'Twelve Tables,' that it has very reasonably been doubted whether such a commission ever existed, or, if it did, whether it did not acquire its information from the Hellenic cities of Lower Italy. Niebuhr, however, thinks the embassy to Greece just possible, though he is obviously reluctant to go further, and affirm that it really did occur (*Lect. Rom. Hist.*, vol. i. p. 296), and points out very clearly the difference between the Roman and Greek laws. 'All,' says he, 'that is distinctive in the Roman law, is not to be found in the Athenian; and distinctive it is with regard to the rights of persons and things. Never had the Greeks the right of paternal authority, like the Romans; never the law, that the wife, by her marriage, entered into the relation of a daughter and co-heiress; never the *jus mancipii*, the formality in the purchase. The difference between property by formal purchase and simple property, between property and hereditary possession, does not exist in the Attic law; the Roman law of inheritance, the Roman law of debt, the Roman system in contracts of borrowing and lending, are quite foreign to the Athenians' (*Lect. Rom. Hist.*, vol. i. pp. 295, 296). These differences, and the number could easily be enlarged, have induced modern historians to adopt the theory—if, indeed, that should be called a 'theory' which, in the eyes of all sound investigators, is a demonstrated fact—viz., that the Twelve Tables, instead of being an eclectic assortment of foreign laws, hitherto unknown to the people of Rome, and imposed on them for the first time, really expressed the first effort towards the codification of the consuetudinary law of the Latin race.

According to Livy (iii. 57) and Diodorus (xii. 56), the laws of the Twelve Tables were cut on bronze tablets (whence their name), and put up in a public place. Whether these tablets were destroyed by the Gauls when they sacked and burned Rome (390 B. C.), is uncertain. At all events, the later Romans entertained no doubt that the collection which existed in their time was genuine. The only portions extant are those which have been quoted by jurists and others. The Twelve Tables is described by Livy (iii. 34) as the *fons publici privatique juris*—the fountain of public and private law. Cicero (*de Or.* i. 43, 44) speaks of them with high praise. In the course of years, the *Jus Publicum*, as could not fail to be the case, was greatly changed, but the *Jus Privatum* of the Twelve Tables continued the fundamental law of the Roman state. See George Long's article 'Lex,' in Smith's *Dic. of Gr. and Rom. Ant.*; Niebuhr's *Lect. Rom. Hist.* (English translation, vol. i. pp. 295—319), Mommsen's *Hist. of Rome* (English translation, vol. i. book i. chap. 11, and book ii. chap. 2). The most complete essay on the history of the extant fragments of the Twelve Tables is to be found in Dirksen's *Uebersicht der bisherigen Versuche zur Kritik, und Herstellung des Textes der Zwölf-Tafel-Fragmente* (Leip. 1824).

TWILIGHT. If the earth had no atmosphere, we should be involved in total darkness from the instant of sunset till the instant of sunrise. The transition from day to night, and from night to day, occupies an interval which varies with the latitude and the declination of the sun, and this intermediate stage is called twilight. As long as the sun is not more than 18° below the horizon, its light is reflected by the air and the clouds and vapours suspended in it, in sufficient quantity to render even distant objects visible. The question of the duration of twilight is, therefore, simply reduced to this: How long, after sunset, or before sunrise, does the sun reach a position 18° below the horizon of a given place? And this can be answered easily by calculation in spherical trigonometry. Thus, if Z be the zenith, P the



pole of the heavens, ASB the horizon, and MSTN the (small) circle which the sun describes about the pole; there is twilight while the sun moves from T

to S, ZT being an arc of 108°. In the spherical triangle ZPT, we know the three sides, for ZP is the colatitude of the place, PT the sun's polar distance, and ZT is 108°. Hence we can calculate the angle ZPT, which is the sun's *hour-angle;* and from this we find at once how long before or after noon the sun passes the point T. If ZT′ be also 108°, we see that it is night while the sun moves from T′ to T, day while it moves from S (through M, its meridian position) to S′, morning twilight from T to S, and evening twilight from S′ to T′. Make ZC = 108°, then, if PN be less than PC, but greater than PA, there will be no point of the sun's path (MS′NS) so far as 108° from Z; and therefore the points T and T′ will not exist. In this case the sun will set and rise, but there will be *no night*, or, rather, twilight will occupy the whole interval from sunset to sunrise. This cannot occur in low latitudes, but does occur during certain periods of the year in northern and southern countries. For

PN is 90° − sun's declination,
PC is latitude + 18°,

and our condition is, therefore, that 90° − sun's declination, while greater than the latitude, does not exceed it by more than 18°. Or, in a simpler form, the latitude, together with the sun's declination, must lie between 90° and 72°. Now, the sun's greatest declination is about 23° 30′, and therefore, in lat. 48° 30′ (72° − 23° 30′), there will be one night in the year (at the summer solstice) consisting wholly of twilight; for higher latitudes, more; and for lower, none. Some curious problems on this subject, such as the finding the time of year at which the twilight is longest in a given latitude, were among the early triumphs of the differential calculus. A curious phenomenon, known as the *afterglow*, or second twilight, often seen in the Nubian desert, is referred by Sir John Herschel to a *second* reflection of solar light in the atmosphere. Lambert and others had previously speculated on the possibility of second and even third twilights, but in their time there was no recorded observation of such appearances.

Attempts have been made to deduce from the duration of twilight the height of the earth's atmosphere; and from various measurements which have given results agreeing fairly with each other, 50 miles has been assigned as a probable value. But, till we know more of the law of temperature in the atmosphere, we have no very direct means of testing the correctness of such results. In all probability, they are too small, as, indeed, we might expect, if we suppose the higher regions of the atmosphere to be much attenuated, and, therefore, reflecting little light. Besides, the ignition of meteorites is believed to have taken place at altitudes of more than 50 miles; and auroral arches have been observed at least 60 miles high.

TWILL, a woven fabric, in which the warp is raised one thread, and depressed two or more threads for the passage of the weft: this gives the structure a curious appearance of diagonal lines.

TYBEE′, an island and sound at the mouth of the Savannah River, Georgia, U. S. The sound is a bay of the Atlantic, extending from Tybee Island on the south to Hilton Head on the north, opening to Port Royal entrance by Cooper's River, Wall's Cut, Lazaretto Creek, and other channels. The island is six miles long by three wide; and was occupied in 1861 by General Sherman, who erected batteries for the reduction of Fort Pulaski, which capitulated April 11, 1862.

TY′BURN, previously to 1783, the chief place of execution in London, was situated near the north-eastern corner of Hyde Park, at the western extremity of Oxford Street, and at the point where the Edgeware and Uxbridge Roads unite. It took its name from a small stream which ran from Hampstead to the Thames through St James's Park, but which has long since disappeared. The gallows seems to have been a permanent erection, resting on three posts, whence the phrase, 'Tyburn's triple tree.' Wooden galleries were erected near it for the accommodation of spectators. Hogarth's Idle Apprentice was executed at Tyburn; and the print which represents the scene, gives a good idea of an execution there. The criminal was conveyed all the way from Newgate to Tyburn, a distance of about two miles, by Holborn and the Tyburn Road, now Oxford Street, but in the 17th c. a 'sloughy country road.' As Oxford Street and London generally spread westward, the long procession became inconvenient, and the place of execution was, on 9th December 1783, removed to the Old Bailey, or Newgate, where it has since remained.

In early times, the frequency of executions rendered the office of hangman more important than it has since become. Throughout the reign of Henry VIII. (38 years), the average number of persons executed in England was 2000 annually. In our own time, the corresponding number has sunk to twelve. Formerly, the hangman must have had almost daily work. This fact, taken in connection with the increase of population, and the employment of the Tyburn hangman in state executions, explains the important place he occupied in popular imagination, and the frequent mention of him in contemporary literature. The first on record was 'one Bull,' who flourished in 1593. He was succeeded by Derrick, referred to in the *Fortunes of Nigel*, and mentioned in a political broadside as living in 1647. In the ballad of *The Penitent Tailor*, published in the same year, reference is made to his successor, Gregory Brandon–

'I had been better to have lived in beggary,
Than to have fallen into the hands of Gregory.'

In Gregory's time, it became the custom to prefix 'squire' to the names of the Tyburn hangmen. This is said to have originated in a practical joke played upon the Garter King-of-arms. He was induced to certify the authenticity of a coat-of-arms of a gentleman named Gregory Brandon, who was supposed to reside in Spain, but who turned out to be the hangman. The Garter King was committed to prison for his negligence, and hence the popular error, that 'an executioner who has beheaded a state prisoner becomes an esquire.' Gregory was succeeded by his son Richard. 'Squire Dun' followed; and after him came Jack Ketch, or Squire Ketch, first mentioned in 1678. He was the executioner who beheaded Lord Russell and the Duke of Monmouth. Lord Macaulay, in speaking of the execution of the latter, says: 'He then accosted Jack Ketch, the executioner, a wretch whose name has, during a century and a half, been vulgarly given to all who have succeeded him in his odious office. "Here," said the duke, "are six guineas for you. Do not hack me, as you did my Lord Russell. I have heard that you struck him three or four times. My servant will give you some gold, if you do the work well."'—See *History of England*, vol. ii. p. 205. What followed, it is needless to repeat. After this time the 'kings of Tyburn' all received the name of Ketch, and their patronymics seem to have been less noted. Jack Ketch's immediate successor was 'one Rose, a butcher;' and the last of the Tyburn hangmen was Edward Dennis, condemned for taking part in the No-Popery Riots, but respited, it is

believed, on the ground that his services could be ill dispensed with.

Among the most memorable executions at Tyburn were those of Elizabeth Barton, the Holy Maid of Kent, and her confederates (1534); John Felton, the murderer of the Duke of Buckingham (1628); Jack Sheppard, the highwayman (1724); Jonathan Wild, the thief-catcher (1725); Mrs Brownrigg, the murderer of an apprentice (1766); Dr Dodd (q. v.), found guilty of forging a bond for £4200 (1777); and the Rev. Henry Hackman, murderer of Miss Reay (1779). The associations connected with Tyburn have naturally led to the suppression of the name in the street nomenclature of London; but it survives in that given to the quarter of the metropolis described by Mr Thackeray as 'the elegant, the prosperous, the polite Tyburnia, the most respectable district in the habitable globe.'—See Chambers's *Book of Days*, vol. ii., and *Notes and Queries*, 2d series, vol. ii.

Under a statute of William III. (10 and 11, c. 23, s. 2), prosecutors who secured a capital conviction against a criminal were exempted from all manner of parish and ward 'offices within the parish in which the felony had been committed.' Such persons obtained what was called a 'Tyburn ticket,' which was enrolled with the Clerk of the Peace, and sold like any other property. The privilege the tickets conferred must have been highly valued, as they sold at a high price. 'Last week,' says the *Stamford Mercury* of 27th March 1818, 'a Tyburn ticket sold in Manchester for £280.' The act under which they were granted was, however, repealed a few months later, by 58 Geo. III. c. 70, passed 3d June 1818; and since then they have ceased to be recognised.—See *Notes and Queries*, 2d series, vol. xi.

TYE, CHRISTOPHER, an English musician of note of the 16th century. He was born at Westminster in 1500, educated in the King's Chapel, and held the office of musical instructor to Edward VI. when Prince of Wales. He received the degree of Musical Doctor from the university of Cambridge in 1545, and from Oxford in 1548. Under Elizabeth, he was organist to the Chapel Royal, and produced various services and anthems, some of which are yet in repute among musicians. Dr T.'s general scholarship was considerable.

TYLER INSURRECTION. A poll-tax of three groats, imposed in 1381, during Richard II.'s minority, to defray the expenses of the war with France, roused the spirit of resistance among the common people. An insult offered by one of the tax-gatherers to a blacksmith's daughter in Essex, led to the first open outbreak. The populace rose everywhere, and under the conduct of two peasants, named Wat Tyler and Jack Straw, they mustered in great force at Blackheath, committing violence on all who came into their hands. They had an interview with the king, who, finding resistance vain, promised acquiescence with their demands, which included a general pardon, freedom of commerce, and the abolition of villeinage. Meantime, a party of insurgents had broken into the Tower, and murdered the Primate and Chancellor, and the Treasurer. The king, encountering Tyler at the head of the rioters in Smithfield, invited him to a conference, when he conducted himself with an insolence that led Walworth, the mayor, to despatch him with a dagger. The king immediately, with great presence of mind, offered himself to head the populace, and leading them to the fields at Islington, where a body of troops had been collected for his Majesty's protection, ordered the rioters to disperse. The revolt, however, was not extinguished without considerable bloodshed.

TYLER, JOHN, tenth President of the United States, born in Charles City county, Virginia, March 29, 1790. His father was an officer of the army in the Revolution, and a judge of the Federal Court of Admiralty. John entered William and Mary College at 12, and graduated at 17, was admitted to the bar at 19, and almost immediately entered upon a large practice. At 21, he was elected to the state legislature, supporting the policy of Jefferson, Madison, and the Democratic party. He was almost unanimously elected five times; and in 1816, entered Congress. During his long congressional career, he sustained all the measures of the State Rights party. In 1825, he was elected governor of Virginia; and in 1827, senator in Congress. He supported General Jackson and the Democratic policy; but sided with Mr Calhoun on the question of nullification. At a later period, however, 1833—1834, he supported Mr Clay's resolutions of censure on General Jackson for removing the government deposits from the United States bank. From this period, he became an active partisan of Henry Clay, the candidate of the Whig or Republican party; and in 1840, was elected Vice-president of the United States, with General Harrison as President. President Harrison died April 4, 1841, a month after his inauguration, by which event Mr T. became President. He began his administration by removing Democrats from office, and appointing Whigs, and pronouncing in favour of Whig measures, but soon after vetoed a bill for a United States bank, passed by Congress; several members of the cabinet resigned; and after some changes, John C. Calhoun, the great Southern Democratic statesman, became Secretary of State. The most important act of his administration was the annexation of Texas, March 1, 1845. At the close of his term of office, he retired to private life until 1861, when he was President of a Peace Convention at Washington. Failing in his efforts at a compromise, he gave his adhesion to the Confederate cause, and was a member of the Confederate Congress until his death, at Richmond, January 17 1862.

TYLO'PHORA, a genus of plants of the natural order *Asclepiadaceæ*, natives of the East Indies, New Holland, &c., with a wheel-shaped corolla, and a 5-leaved fleshy coronet. *T. asthmatica*, a native of the coast of Coromandel, has a high reputation as a medicinal plant. Its root possesses properties similar to those of ipecacuanha, has been found of great use in dysentery, and is esteemed one of the most valuable medicines of India.

TY'MPANUM (Lat. a drum), in Anatomy, the middle ear (see EAR). In Architecture, the flat space left within the sloping and horizontal cornices of the pediment of Classical Architecture, usually filled with sculpture (see GRECIAN ARCHITECTURE, fig. 2); also, the space between the arch and lintel of doorways in Gothic Architecture.

TYNDALL, JOHN. See SUPPLEMENT in Vol. X.

TYNE, a river in the north of England, important from the enormously valuable mineral district through which it flows, and for the flourishing towns that line its banks, is formed by the confluence of two head-waters—the North Tyne and the South Tyne. The North Tyne rises on the Scottish border, 11 miles south-east of Hawick. It flows south across Keelder Moor, and south-east to Hexham, after traversing a district abounding in picturesque villages and gentlemen's seats. Its chief affluent is the Reed, which rises on Carter Fell, and flows south-east past Otterburn to Bellingham, where it joins the larger stream. Near Hexham, the North Tyne is joined by the South

Tyne, which rises on the slopes of Cross Fell, 11 miles north of Appleby, in Westmoreland, flows north to Haltwhistle, and thence east to Hexham, through a district crowded with old castles and peel-houses. From the junction of the two head-waters, the T. flows east through the south of Northumberland, which presents charming scenery, and is studded with castles and country seats. At Blaydon—about 8 miles above Newcastle—the navigation begins, and from this point, passing Newcastle (q. v.), Gateshead (q. v.), North Shields (q. v.), and South Shields (q. v.), its banks are lined with foundries, furnaces, docks, wharfs, and quays. Total length 80 miles. For the navigation of the river, see the chief towns near its mouth.

TY'NEMOUTH, a small village and parish of Northumberland, takes its name from the river Tyne, on the south bank of which, and near its mouth, it stands. It is 8 miles east of Newcastle by railway, and its light-house is in lat. 55° 1′ N., long. 1° 25′ W. Though itself only a village, it gives name to a township containing about 25,000 inhabitants. Much of this township, however, is comprised in the town of North Shields (see SHIELDS, NORTH), and counts in the population of that town. It also gives name to a parliamentary and municipal borough, containing (1881) 43,863; but including, besides the village of T., the large town of North Shields, and the three villages of Chirton, Preston, and Cullercoats. The village of T. is much frequented as a watering-place by the inhabitants of Newcastle. Its sands, about a mile in length, form an excellent bathing-ground. There are many attractive buildings and institutions, as the castle and fortifications, the fine ruins of a priory and Lady chapel, the Master Mariners' Asylum, &c. The borough of T. sends one member to the House of Commons.

TYPE (Gr. *typos*, an impression or stamp), the name given to the stamps or dies which impress the letters on the paper in Printing (q. v.). Printers, in early times, made the letters which they used, but in process of time the necessity for a division of labour created the distinct business of *type-founding*. There is evidence that, at the beginning of the 16th c., the apparatus for type-founding was much the same as up till near the middle of this century. The first step in the process is the cutting of a punch or die resembling the required letter. The punch is of hardened steel, with the figure of the letter cut, the reverse way, upon its point. On this die being finished, it is struck into a piece of copper about an inch and a quarter long, one-eighth of an inch deep, and of a width proportionate to the size of the type to be cast. This copper, being so impressed with the representation of the letter, requires to be adjusted to the mould, so that the 'face' or impression of the punch (in the copper) may be brought into such relation with the metal which forms the 'body' or stalk of the type, that when the types are 'set up' they may stand at the proper distance from each other, and be in 'line' or range, and also square to the page; this work is termed 'justifying,' and the copper is now a 'matrix.' The matrix is now fixed into a small instrument or frame, called the mould, which is composed of two parts. The external surface is of wood, the internal of steel. At the top is a shelving orifice, into which the metal is poured. The space within is of the size of the required body of the letter, and is made exceedingly true. The melted metal, being poured into this space, sinks down to the bottom into the matrix, and instantly cooling, the mould is opened, and the type is cast out by the workman. This process of casting types is executed with great celerity. Of course, every separate letter in the alphabet, every figure, point, or mark, must have its own punch and matrix. In casting types, the founder stands at a table, and has beside him a small furnace and pot with heated metal, which he lifts with a small ladle. *Type-metal* was a compound of lead and regulus of antimony, with a small proportion of tin; but in 1856, a new compound was formed by adding a *large* proportion of tin to the lead and antimony, which considerably increased the cost of the metal, but it doubled its durability. The antimony gives hardness and sharpness of edge to the composition, while the tin gives toughness and tenacity, and removes the brittleness which antimony causes when used in a large proportion without tin. The proper proportions of these metals are regulated by the size of the type, a greater quantity of antimony being employed for small letters.

Various attempts were made during the early part of this century to cast type by machinery; but the first successful type-casting machine was invented by David Bruce, Jr., of New York, and was patented March 17, 1838.* The patent was sold to George Bruce, and the machines were used by him until 1845. David Bruce meanwhile patented another machine in 1843, which, with new improvements, patented two years later, gave entire satisfaction, and is now in general use in American foundries. This machine (in some cases with modifications) was slowly adopted by European founders. It produces more than double the quantity that the hand-mould did, while the finish and regularity of the type so cast are much more perfect.

The type-casting machine consists, first, of a small melting-pot, which contains the molten metal and is placed over a small furnace having an outer

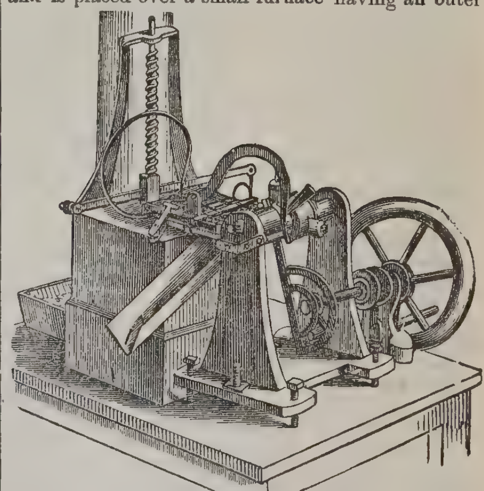


Fig. 1.—Type-casting Machine.

case of cast-iron. In the interior of the pot is arranged a forcing-pump and valve for admitting the metal under the piston, and also for preventing the return of the metal into the mass in the pot when the piston is depressed, and thus securing the full force exerted upon the piston being transmitted by the piston to the molten metal under it, and forcing it through a narrow channel leading from the bottom of the chamber in which the piston works to the outside of the pot, where a nipple is

* The first type-casting machine was patented in the United States in 1828, by William M. Johnson; but it did not produce good type.

inserted, with a small hole through it, communicating with this narrow channel. Against this nipple, the mould in which the type is formed is pressed at the moment at which the piston descends, and so receives the molten metal that forms the type.

The second part of the machine is that which carries the mould, and to which the mould is firmly bolted. The mould is similar to the old hand-mould, but modified to suit the machine; it is much stronger; the 'jets' are shorter, and the orifice by which the metal enters is smaller, so that it may be brought exactly coincident with the small hole in the nipple in front of the pot. The mould—as the old hand-mould—is made in halves; the one half being firmly bolted to an arm which, by cams and levers, is made to oscillate, and carry the mould to and from the nipple in front of, and above the pot; the other half of the mould is bolted to another arm, which, by a peculiarly formed hinge, is attached to the first arm, so that the two halves of the mould may be made to open and shut upon each other, like the lid of a snuff-box; and so both sides of the mould oscillate together to and from the nipple in the pot from which they receive the molten metal. The furnace, with the pot and machine carrying the mould, are raised upon cast-iron framing to a height convenient for a man standing to watch the working of the machine. The operation of the machine is as follows: The piston being raised in the chamber of the pump, and the chamber being supplied with metal through the valve, the mould is brought against the nipple; the valve closes, to prevent the metal being forced back into the pot; the piston descends, and forces the metal through the narrow channel into the mould; the mould then recedes from the nipple, and in receding, the two halves separate from each other, and eject the type; the mould again approaches the nipple, and in approaching, the two halves close together, and are ready for another operation.

A blast of cold air is directed upon each mould, to keep it cool.

When the type is cast from the mould, it is in a rough state; and as soon as a heap has accumulated on the caster's table, they are removed by a boy, who breaks off a superfluous tag of metal, or 'jet,' hanging at the end of each type. From the breaking-off boy the types are removed to another place, where a boy rubs or smooths their sides upon a stone. Being now well smoothed, they are next removed to a table, and set up in long lines upon a 'stick;' they are then dressed or finished, and after being examined by a magnifying glass, are ready for use. Whatever be the size of the types they are all made of a uniform height, and must be perfectly true in their angles, otherwise it would be quite impossible to lock them together. A single irregular type would derange a whole page. The height of type made in this country is $\frac{29}{32}$ds of an inch; those made in France, Spain, and Germany are higher. All the types of one class of any founder are always uniform in size and height; and to preserve their individuality, all the letters, points, &c. belonging to one class are distinguished by one or more notches or nicks on the body of the type, which range evenly when the types are set. These nicks, as we shall immediately see, are also exceedingly useful in guiding the hand of the compositor. Types are likewise all equally grooved in the bottom, to make them stand steadily.

The earliest types used were in the style known as Gothic or Black-letter; which was afterwards superseded, except in Germany, by the Roman letter. See BLACK-LETTER. The varieties of size of types in the present day amount to forty or fifty, enlarging, by a progressive scale, from the minutest used in printing pocket-Bibles, to the largest which is seen in posting-bills on the streets. Printers have a distinct name for each size of letter, and use about sixteen sizes in different descriptions of book-work; the smallest is called *Brilliant*, the next *Diamond*, and then follow in gradation upwards, *Pearl*, *Agate*, *Nonpareil*, *Minionette*, *Minion*, *Brevier* (the type with which this sheet is printed), *Bourgeois*, *Long Primer*, *Small Pica*, *Pica*, *English*, *Great Primer*, and *Double Pica*. The larger sizes generally take their names thus—*Two-line Pica*, *Two-line English*, *Four*, *Six*, *Eight*, or *Ten line Pica*, &c. Other nations designate many of these sizes by different names. Some of these names were given from the first maker; others from the books first printed with the particular letter. Thus, *Cicero* is the name of a type in France and Germany, with which Cicero's letters were first printed (Rome, 1467); *Pica* is from the service of the mass, termed *Pica* or *Pic*; *Primer*, from *Primarius*, the book of Prayers to the Virgin; *Brevier*, from *Breviary*; *Canon*, from the *canons* of the Church, &c.

All kinds of types are sold by weight by the founders, the price varying in amount according to the size of the letter. The smallest size, *Brilliant*, costs about $5 per pound; *Diamond*, $1.80 per pound; *Brevier*, about 70 cents; *English*, 56 cents; and so on in proportion for all intermediate sizes. Expensive as types thus are, their prices will not appear too high, considering the immense outlay in cutting the punches and the general manufacture. In the *Diamond* size, 3300 go to a single pound-weight of the letter *i*, and of the thinnest *space* about 5000.

A complete assortment of types is called a *Fount*, which may be regulated to any extent. Every type-founder has a scale shewing the proportional quantity of each letter required for a fount; and a peculiar scale is required for every language. For the English language, the following is a typefounder's scale for the small letters of a fount of types of a particular size and weight:

a	8500	h	6400	o	8000	v	1200
b	1600	i	8000	p	1700	w	2000
c	3000	j	400	q	500	x	400
d	4400	k	800	r	6200	y	2000
e	12,000	l	4000	s	8000	z	200
f	2500	m	3000	t	9000		
g	1700	n	8000	u	3400		

It will be seen from this scale that the letter *e* is used much more frequently than any other character.

Type-founding originated in Germany along with printing; as early as 1452, P. Schöffer (see GUTENBERG) had substituted types of cast-metal for the original wooden types. The earliest and best punch-cutters were in Nürnberg, which continued for a considerable time to supply the type-founders throughout Germany with punches. Bodoni (b. 1740, d. 1813) in Italy, the Didots (q. v.) in France, and Breitkopf (b. 1719, d. 1794) in Leipzig, are the most distinguished names in the subsequent history of type-making on the continent. The art made little progress in Great Britain from the time of Caxton, and the types used were mostly imported from Holland, until about the year 1720, when William Caslon, originally an engraver of ornamental devices, turned his attention to letter-cutting, and soon established such a reputation as not only put a stop to the importation of foreign types, but caused his own to be frequently sent to continental countries. The foundry established by Caslon in London is still in existence. Baskerville (q. v.) is the next greatest name in the history of the art in England. The types produced by Alexander Wilson of Glasgow became the foundation of the fame of the Foulis (q. v.) as printers.

The earliest type-founder in America was Christopher Saur (or Sower), who cast the type used by him in printing a German Bible in quarto, about the year 1735, in Germantown, Pa. The first regular foundry was commenced in 1796, by Binney & Ronaldson, in Philadelphia. This foundry (now conducted by Mackellar, Smiths & Jordan) is one of the most extensive in the world, and the quality of its manufactures is unsurpassed. Excellent type is also made in New York, Boston, Cincinnati, and other cities in the United States. American wood type, for posters and handbills, is so highly esteemed that it commands the market even in Great Britain.

Type-setting, or 'Composing.'—All the types used in printing-offices are sorted in cases, or shallow boxes, with divisions. There are two kinds of cases —the *upper* and *lower case;* the latter lying nearest the compositor upon the frame for their support. The annexed illustration exhibits the arrangement of the cases and position of the compositor—the lower case being immediately under his hand, the

Fig. 2.

upper case directly above in a slanting position, and the under part of the frame stocked with cases of different founts. In the upper case are placed all the capitals, small capitals, accented letters, a few of the points, and characters used as references to notes. In the lower case lie all the small letters, figures, the remainder of the points, and spaces to place betwixt the words. In the lower, no alphabetical arrangement is preserved; each letter has a larger or smaller box allotted to it, according as it is more or less frequently required; and all those letters most in request are placed at the nearest convenient distance to the compositor. By this ingenious and irregular division of the lower case, much time is saved to the compositor, who requires no label to direct him to the spot where lies the particular letter he wants. To a stranger, nothing appears so remarkable as the rapidity with which a compositor does his work; but habit very soon leads the hand rapidly and mechanically to the letter required. When *italic* letters have to be introduced, they are taken from a separate pair of cases of the same fount.

The process of composing and forming types into pages may now be adverted to. Placing the copy or manuscript before him on the upper case, and standing in front of the lower case, the compositor holds in his left hand what is termed a composing-stick. Sometimes this instrument is of wood, with a certain space cut in it of a particular width; but more commonly it is made of iron or brass, with a movable slide, which, by means of a screw, may be regulated to any width of line. In either case, the composing-stick is made perfectly true and square. One by one, the compositor lifts and puts the letters of each word and sentence, and the appropriate points, into his stick, securing each with the thumb of his left hand, and placing them side by side from left to right along the line. When he places a letter in the stick, he does not require to look whether he is placing it with the face in its proper position; his object is accomplished by looking at what is called the *nick*, which must be placed outward in his composing-stick. (See adjoining representation of a type.) This is one of those beautiful, and at the same time simple, contrivances for saving labour which experience has introduced into every art, and which are as valuable for diminishing the cost of production as the more elaborate inventions of machinery. When he arrives at the end of his line, the compositor has a task to perform in which the carefulness of the workman is greatly exhibited. The first letter and the last must be at the extremities of the line: there must be no large spaces left in some instances, and crowding in others, as we see in the best manuscript. Each metal type is of a constant thickness, as far as regards that particular size of letter; though all the letters are not of the same thickness. The adjustments, therefore, to complete the line with a word, or at any rate with a syllable, must be made by varying the thickness of the spaces between the words. A good compositor's work is distinguished by uniformity of spacing; he will not allow the words to be very close together in some instances, and with a large gap between them in others, as is evident, for instance, in this sentence. In composing poetry, or similar matter, where there is always a blank space at one of the ends of the line, spacing is very easily accomplished by filling up the blank with larger spaces, or *quadrats.* But whether prose or poetry, the matter of each line must be equally adjusted and *justified,* so as to correspond in point of compactness with the previously set lines. The process of composing is greatly facilitated by the compositor using a thin slip of brass called a *setting-rule,* which he places in the composing-stick when he begins, and which, on a line being completed, he pulls out, and places upon the front of the line so completed, in order that the types he sets may not come in contact with the types behind them, but glide smoothly into their places to the bottom of the composing-stick.

Fig. 3.

When the workman has set up as many lines as his composing-stick will conveniently hold, he lifts them out by grasping them with the fingers of each hand, and thus taking them up as if they were a solid piece of metal. He then places the mass in an elongated board, termed a *galley,* which has a ledge on one or perhaps both sides. The facility with which some compositors can lift what is called a *handful* of movable type without deranging a single letter, is very remarkable. This sort of skill can only be attained by practice; and one of the severest mortifications which the printer's apprentice has to endure, is to toil for an hour in picking up about a thousand letters, and then see the fabric destroyed by his own unskilfulness, leaving him to mourn over his heap of broken type, technically denominated *pie.*

Letter by letter, and word by word, is the composing-stick filled; and by the same progression the galley is filled by the contents of successive sticks. When the compositor has set up as many lines as fill a page, he binds them tightly round with cord, and removes them from the galley.

Sometimes, as in the case of newspaper and

similar work, the *handfuls* of type are accumulated till they fill the galley, and in that form are prepared for press. After the matter is thus far prepared, it is the duty of the pressman to take an impression or *first proof* from the types, in order that the first-proof *reader* may compare with 'copy,' or MS.; after which it is handed to the compositor, so that he may correct the errors which are sure to have been made. Proofs are usually taken by a press kept for the purpose. After the galley matter is corrected and re-corrected by the compositor, it is divided into pages of the size wanted; and head-lines or figures indicating the number of the page, being added, the pages are arranged upon a large firm table, and there securely fixed up in an iron frame or *chase*, by means of slips of wood and wedges, or *quoins*. The annexed cut is a representation of a small *form*, consisting of four pages of type.

This process, which is called *imposing*, being completed, and the face of the types being levelled by a *planer* and mallet, the *form*, as it is called, is

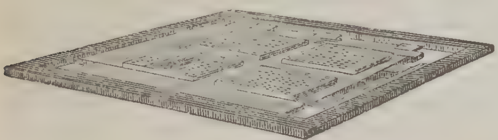

Fig. 4.

proved, and prepared for press. Proof-sheets being taken, they are subjected to the scrutiny of a *reader* employed in this peculiar function in the office, the author himself having previously given effect to his corrections or emendations. When the *reader* has pointed out words and letters to be altered or corrected, the compositor once more goes over the form, correcting the errors by lifting out the letters with a bodkin, and, when revised, the sheet is pronounced ready for printing. The imposing-table at which all these corrections are made is usually composed of smooth stone or marble or cast-iron on the top. See TYPE-SETTING MACHINES in SUPPLEMENT in Vol. X.

TYPE, in Theology, an image or representation of some object which is called the antitype. In theological use, it is applied chiefly, although not exclusively, to those prophetic prefigurings of the persons and things of the New Dispensation which are found in the ritual, and even in the history, of the Old Testament. Under the heads HERMENEUTICS, EXEGESIS, have been explained the different senses of which the literal text of Scripture is considered susceptible. Of one of these, the 'mystical,' the 'typical' sense forms a further subdivision. The word 'type' itself is used as well by the writers of the New Testament (Acts, vii. 43; Romans, v. 14; Philippians, iii. 17) as by the Jewish historians, for instance, Philo, *Opp.* t. i. p. 108; and while St Paul and other sacred writers speak of the ancient types of things to come, St Peter completes the parallelism by describing baptism as the antitype of the ark of Noah, 1 Peter, iii. 21. Of the types of the Old Testament, many are directly pointed out as such in their very institution; many also are distinctly applied in the New Testament. There is a large class, however, which more properly fall under the mystical sense of Scripture, and which are called indirect, that is to say, 'adaptive' or 'applied' types. In the application and interpretation of these, many of the Fathers, and especially Augustine and Gregory the Great, are most elaborate and ingenious.

TYPES, CHEMICAL. The idea of referring organic bodies to some simple type or representative has attracted the attention of many chemists, amongst whom Dumas, Sterry Hunt, Laurent, and Gerhardt especially deserve notice. As our limited space prevents us from attempting to trace out the history of the theory, we shall confine ourselves to a statement of the outline of the doctrine, as now adopted in most recent books on organic chemistry. Hydrochloric acid, water, ammonia, and marsh gas have been shewn to be compounds, each of which may be taken as a representative of a whole class of bodies. The four principal types to which all chemical compounds are now referred are, therefore, (1) the hydrogen, HH, or hydrochloric acid type, HCl; (2) the water type, H_2O; (3) the ammonia type, H_3N, and (4) the marsh gas type, H_4C.

In all the formula here used, the atomic weight of oxygen is taken at 16, sixteen parts of oxygen being the smallest quantity which unites with two atoms of hydrogen to form water, and nearly all oxidised compounds must necessarily be represented with 16 or some multiple of 16 parts of oxygen. Carbon is represented by its equivalent number 12.

1. The hydrogen, or hydrochloric acid type, $\left.\begin{array}{l}H\\Cl\end{array}\right\}$, includes the chlorides, hydrides, haloid salts, metallic hydrides, metals proper and alloys, halogen ethers, metallic compounds of alcohol radicles, acid chlorides, aldehydes, and acetones. Examples may be found in chloride of potassium KCl, chloride of ethyl $(C_2H_5)Cl$, potassium ethyl, $K(C_2H_5)$, acetic aldehyde $(C_2H_3O)H$, &c.

2. The water type, $\left.\begin{array}{l}H\\H\end{array}\right\}O$, includes the oxides, sulphides, selenides, &c., whether basic, alcoholic, intermediate, or acid. The following are examples: methyl alcohol, $CH_4O = \left.\begin{array}{l}CH_3\\H\end{array}\right\}O$; ethyl alcohol, or common alcohol, $C_2H_6O = \left.\begin{array}{l}C_2H_5\\H\end{array}\right\}O$; acetic acid, $C_2H_4O_2 = \left.\begin{array}{l}C_2H_3O\\H\end{array}\right\}O$; acetate of potash, $C_2H_3O_2K = \left.\begin{array}{l}C_2H_3O\\K\end{array}\right\}O$; acetic ether, or acetate of ethyl, $C_4H_8O_2 = \left.\begin{array}{l}C_2H_3O\\C_2H_5\end{array}\right\}O$; common ether, or oxide of ethyl, $C_4H_{10}O = \left.\begin{array}{l}C_2H_5\\C_2H_5\end{array}\right\}O$, &c.

3. The ammonia type, H_3N, or $\left.\begin{array}{l}H\\H\\H\end{array}\right\}N$, includes the amines and amides, the nitrides, phosphides, arsenides, whether alcoholic, intermediate, or acid. For example: amide of potassium, $KH_2N = \left.\begin{array}{l}K\\H\\H\end{array}\right\}N$, or as it may be written, K.H.H.N; nitride of potassium, $K_3N = \left.\begin{array}{l}K\\K\\K\end{array}\right\}N$; ethylamine, $(C_2H_5)H_2N = \left.\begin{array}{l}C_2H_5\\H\\H\end{array}\right\}N$, and dibenzol sulpho-phenylamide, $(C_7H_5O)_2(C_6H_5SO_2)N = \left.\begin{array}{l}C_7H_5O\\C_7H_5O\\C_6H_5SO_2\end{array}\right\}N$.

4. The marsh gas type, H_4C, $\left.\begin{array}{l}H\\H\\H\\H\end{array}\right\}C$, includes a numerous class of compounds which are produced by replacement of more or less hydrogen of the marsh gas, which is the normal hydride of carbon. Thus, chloride of methyl, CH_3Cl, is monochlorinated marsh gas, $\left.\begin{array}{l}Cl\\H\\H\\H\end{array}\right\}C$; methyl-alcohol is marsh gas wherein hydro-

gen has been replaced by peroxide of hydrogen, $\left.\begin{matrix}HO\\H\\H\\H\end{matrix}\right\}C$; formic acid is marsh gas wherein some of the hydrogen has been replaced by oxygen, and some by peroxide of hydrogen; thus, $\left.\begin{matrix}O_2\\HO\\H\end{matrix}\right\}C$.

To the above may be added the multiple and mixed types, formed by combining two or more together; sometimes, however, it is convenient to refer compounds to types containing radicles of higher atomicity; for example, pentachloride of phosphorus, PCl_5, may be referred to a type, HHHHHP; or chloride of tungsten, WCl_6, to that of HHHHHHW.

In classifying the elements, those which combine by volume, in the proportion of 1 to 1, are termed *monatomic*, and all others, *polyatomic*. The union of two or more molecules of the same or different types by the substitution of polyatomic elements or radicles for an equivalent number of hydrogen atoms gives considerable extension to the power of typical representation.

The same compound may be referred to different types; thus, trichloride of phosphorus, PCl_3, may be derived from a triple molecule of hydrochloric acid, $3HCl$, by substitution of P''' for H_3; or from ammonia, NH_3, by substitution of P for N, and Cl_3 for H_3.

All chemical compounds may be regarded as aggregations of ideal hydrogen-molecules, held together by the introduction of one or more polyatomic elements or radicles. The several types are not classes of compounds distinctly separated from one another by differences of constitution, but rather movable groups, in which compounds may be placed together according to the particular analogies which it is desired to bring to light.—See Graham's *Elements of Chemistry;* articles *Classification* and *Types*, in Watts's *Dictionary of Chemistry;* also *Smithsonian Report*, 1863.

TY'PHA, a genus of plants, belonging to the natural order *Typhaceæ* of some botanists, which, according to others, is a sub-order of *Araceæ*. The *Typhaceæ* all inhabit marshes or ditches. They have nodeless stems, unisexual flowers arranged on a spadix, without a spathe, the spadix of the male flowers being situated at the summit of the stem, above that of the female flowers, the perianth consisting of scales or lax hairs, the anthers on long filaments, the fruit dry, consisting of the seed with adherent pericarp. They are found in very different climates, and scattered over the world. Two species of T. are found in North America, *T. latifolia* and *T. angustifolia*, and are popularly known as CAT'S-TAIL or REED-MACE. *T. latifolia* is not so common as the former, and is known as the SMALL CAT-TAIL. It grows to the height of five or six feet. The root-stocks are astringent and diuretic, and abound in starch. The young shoots both of this and *T. angustifolia* are much eaten by the Cossacks of the Don; and are sometimes used in England under the name of *Cossack Asparagus*. The pollen of T. is inflammable, like that of *Lycopodium*, and is used as a substitute for it. *T. angustifolia* and *T. elephantina* are employed in India for making mats and baskets.

TYPH-FEVER is a term which is now coming into use to designate continued low fever. The best-marked varieties of this affection are known as typhus and typhoid fevers, which in typical cases are easily distinguished from one another, but not unfrequently so merge into one another that it is difficult to decide whether the disease should be classed as typhus or typhoid fever; and hence the general term typh-fever is a very convenient one in doubtful cases. All the typh-fevers belong nosologically to the miasmatous order of zymotic diseases.

TY'PHON, in Egyptian Mythology, was the Greek name of a son of Seb (Kronos) and Nut (Rhea). The latter gave birth to five children on the last five days of the year; first, Osiris and Haroeris, then T., and lastly Isis and Nephthys. The Egyptian name of T. was Set, also Suti and Sutech, and in the earliest times he was a highly venerated god. He often appears on the monuments in the form of a beast, the cunning crocodile, the dreaded hippopotamus, or the obstinate ass, and with yellow hair and long blunted ears. From him the kings of the 19th dynasty, Seti (Sethos, Sethosis, changed by Herodotus into Sesostris), derive their name. The city of Ombos was a special seat of his worship. In later times, however, either about the close of the 21st dynasty or afterwards, his worship was abandoned, and his figure and name were obliterated from many of the monuments. The cause of this curious religious revolution is unknown, but at any rate, T. came to be regarded as a god hostile to the Egyptians, and was gradually developed into a personification of the principle of Evil—in short, the Egyptian Devil, the opponent of holy doctrine, and adversary of Osiris—the god of the waste howling wilderness, of the salt lakes, of drought, and of scorching heat.

The connection between the Egyptian *Set* and the Greek T. is not very easy to trace, but it undoubtedly existed. According to Homer, T. (called also Typhāon) was a huge giant, chained under the earth in the country of the Arimoi, and lashed by the lightnings of Zeus. Hesiod makes him a son of Typhōeus and a hurricane, and, by the snake-goddess, Echidna, the father of the Chimæra, the many-headed dog Orthus, the hundred-headed dragon that guarded the apples of the Hesperides, the Colchian Dragon, the Sphinx, Cerberus, Scylla, Gorgon, the Lernæan Hydra, the Eagle that consumed the liver of Prometheus, and the Nemean Lion. Typhōeus, again, was the youngest son of Tartarus (Hell) and Gæa (Earth), or, as others say, of Hera (Juno) alone. At a later period, the father and son coalesced into one person. Pindar describes T. as a monster with a hundred dragon-heads, fiery eyes, a black tongue, and a terrible voice. He sought to wrest the sovereignty of the world from Zeus, but after a fearful struggle, he was subdued by a thunderbolt from Olympus, and hurled into Tartarus, or buried under Ætna. The later poets modify the older myth with fabulous additions of their own. They connect T. with Egypt—a proof, perhaps, that he had come to be identified with the Egyptian *Set*. According to Ovid and others, all the gods fled before him into Egypt, and through fear, changed themselves into animals, excepting Zeus and Athene. After an appalling struggle, in the course of which Zeus was once hamstrung, and carried off by the daring monster, T. was vanquished, but not before he had hurled all Mount Hæmus against his adversary, in a paroxysm of supernatural rage. It is very possible that the fierce *physical* opposition of T. (especially when the monster came to be identified with *Set*, the Egyptian Devil) may have had (along with other causes) a material influence in determining that popular conception of 'Satan' which reigned both in patristic and medieval times, and of which Milton has so largely availed himself in his *Paradise Lost*.

TYPHOO'NS (Chinese *Tei-fun*, i. e. 'hot wind;' the word, it need scarcely be said, has no connection

with the Typhon of mythology) are violent storms which blow on the coast of Tonquin and China as far north as Ningpo and the south-east coasts of Japan. Varenius, in his *Geographia Naturalis*, describes them as 'storms which rage with such intensity and fury that those who have never seen them can form no conception of them; you would say that heaven and earth wished to return to their original chaos.' They occur from May to November; but it is during the months of July, August, and September that they are most frequent. They resemble the storms of Western Europe (see STORMS) in their general characteristics, with this difference, that the main features are more strongly marked. There is a depression of the barometer, over a space more or less circular in form, accompanying the typhoon, but it is generally more contracted in area, and deeper and more abrupt than in European storms. It is not uncommon for the barometer, at the centre of the depression, to read 28·3 inches, and on rarer occasions to fall even as low as 27 inches; and the changes of pressure are very rapid, frequently ·2 or ·3 inch in an hour. It is this enormous difference of atmospheric pressure between neighbouring places, and the consequent rapidity of the fluctuation, which give to these storms their terribly destructive energy—the law regulating the strength of the wind being, that it is proportioned to the difference of pressure between the place from which it comes and the place toward which it blows. The low pressure in the centre is confined to a very limited space, and since all round this space the pressure is greater, it follows that the level of the sea there will be higher. Hence, a high wave is frequently found to accompany these storms, advancing inland, carrying with it ruin and dismay, and not unfrequently bearing ships far over the level fields, where they are left stranded a considerable distance from the sea.

Typhoons have their origin in the ocean to the east of China, especially about Formosa, Luzon, and the islands immediately to the south. They thence proceed, in four cases out of five, from east-north-east toward west-south-west, more rarely from east-south-east to west-north-west, and scarcely ever from north to south, or from south to north; in other words, their course is generally along the coast of China. The body of the storm advances at the rate of 12 miles an hour and upwards, within which the winds blow often from 80 to 100 miles an hour, whirling round the centre of atmospheric depression in a direction contrary to the motion of the hands of a watch, as all storms in the northern hemisphere do. They thus rotate in the direction south, east, north, west; and travel along the coast, so that the coast feels the northern side of the storm, while at a distance from the coast the southern side is alone experienced. The south-west Monsoons (q. v.) prevail in summer over Southern Asia, to the eastward of which are the north-east trade-winds. See WINDS. Here, then, are two great aërial currents flowing contiguously, *but in opposite directions*, each highly charged with moisture, especially the south-west current, which they have taken up from the oceans they have traversed. It is highly probable that the typhoons take their origin from these opposing currents, as whirlpools do at the meeting of two sea-currents; and their intensity is aggravated by the large quantity of heat disengaged in the condensation of the vapour of the atmosphere into the deluges of rain which fall during the storm—10 and 12 inches of rain frequently falling in one day. Much yet remains to be done towards the examination and explanation of this remarkable class of storms, the first and essential step being the establishment of meteorological stations on the Chinese coast, in Japan, in Formoso, and in Luzon.

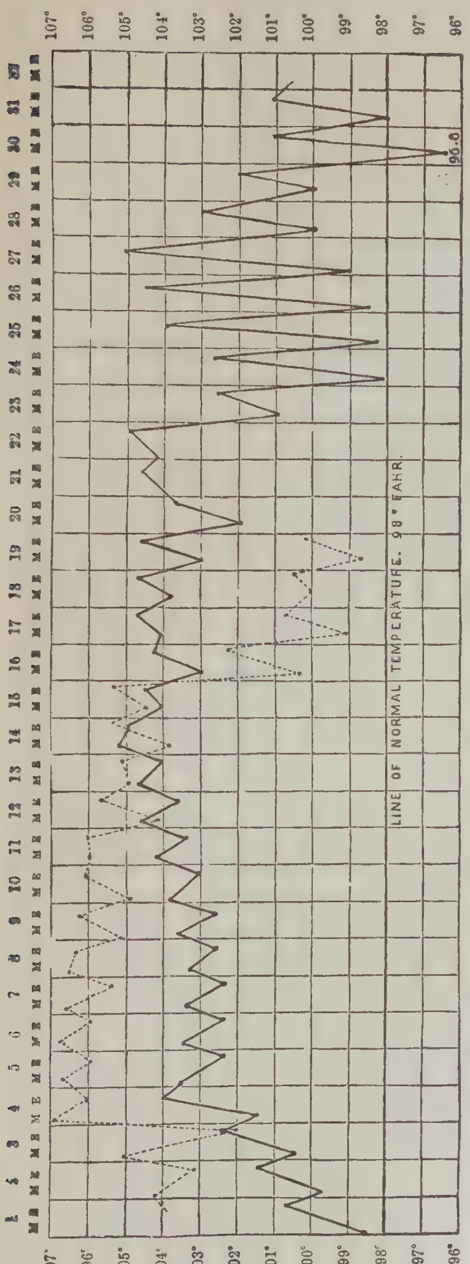
TY'PHUS AND TY'PHOID FEVERS have so much in common, that, to avoid repetition, we shall discuss them in one article. Until comparatively few years ago, it was generally believed that no definite distinctions could be drawn between the various forms of continued low fever met with in this country. In 1840, Dr A. P. Stewart, lately one of the physicians to the Middlesex Hospital, pointed out the differences which are now almost universally recognised between typhus and typhoid fevers; but his views received little attention till 1848—1850, when Dr Jenner, now Physician to her Majesty, published two papers on *The Identity or Non-identity of Typhus and Typhoid Fevers*, and on *Diseases commonly confounded under the term Continued Fevers*. In these memoirs, Dr Jenner shews, by evidence which must be satisfactory to every unbiassed mind, that typhus and typhoid fevers differ, as Dr Watson observes, 'notably and constantly in their symptoms and course, in their duration, in their comparative fatality, in the superficial markings which respectively belong to them, and which warrant our classing them amongst the exanthemata, in the internal organic changes with which they are severally attended, and (what is the most important and the most conclusive) in their exciting causes.'—*Lectures on the Principles and Practice of Medicine*, 4th ed., 1857, vol. ii. p. 795. In addition to typhus and typhoid, there is a third well-marked variety of continued fever, known as *Relapsing Fever*, which has been considered in a special article.

Typhus Fever sometimes commences to shew itself by certain premonitory symptoms, due to the depressing action of the poison—which, as will presently be seen, is the cause of the disease—upon the nervous system before it begins to affect the circulation. The patient, in these cases, is listless, unwilling to make any bodily or mental exertion, loses his appetite, feels wandering pains over the body, is drowsy during the day, and restless at night. More commonly, however, the disease begins suddenly, a shivering fit being the first symptom. Severe headache, especially across the forehead, is another common early symptom. The muscular power rapidly becomes enfeebled, and the patient very soon feels compelled to take to his bed. As in typical cases of the disease, there are three sets of symptoms, each of which occupies about a week, it is convenient to divide the description of continued (or typh) fever into that of three weekly stages. In the first week, in addition to the symptoms already noticed, the heat of the skin becomes increased, and the pulse, which at first is hard, becomes soft and weak, and more frequent than in health, often now rising to 120, and in severe cases reaching 130 or 140 beats in a minute. According to Dr Jenner, the pulse in uncomplicated *typhus* gradually rises to a maximum, preserves that rate for a variable time, and then slowly falls; while in *typhoid* it rises and falls irregularly. There is considerable thirst; the tongue becomes clammy and dry, and its centre is covered with a white fur, which is often mesially divided by a straight brown streak, which is the first step to the blackness of that organ which afterwards ensues. The intelligence is blunted; but on being sharply spoken to the patient still gives rational answers. As the week advances, the strength is so reduced, that he lies on his back, and is unable to turn about in bed without assistance. In the second week, the pulse becomes more frequent, weaker, and more compressible, and the tongue grows drier and browner. The teeth and lips are invested with dark sordes, consisting of morbid epithelium that had been shed;

and the weakness is now so extreme, that the patient sinks down in his bed. His voice becomes very feeble, and in bad cases he cannot swallow, nor can he put out his tongue. The two most remarkable symptoms of the second week are the delirium which seems to replace the headache, and about the ninth day ensues, and the appearance of the characteristic eruption. The delirium usually appears on the patient's awakening from sleep. He is inattentive to all that goes on around him, and usually lies still, muttering disjointed sentences, like a man talking in his dreams. Sometimes, however, he is more actively delirious, talking loudly and trying to leave his bed. He may sometimes be roused by a strange voice, but soon relapses into his previous state. The senses are in a disturbed condition, the patient being commonly deaf, and, in advanced cases, often suffering from *Muscæ Volitantes* (q. v.), which gives rise to attempts to grasp these visionary objects, or to pick them from the bedclothes. This symptom, which is known in medical language under the name of *Floccitatio*, is almost certainly indicative of a fatal result. The characteristic eruption, which Dr Jenner calls the *mulberry rash*, may shew itself as early as the fifth day, but most commonly appears at the beginning of the second week, and sometimes a little later. The characters of the rash vary with its age. It consists of very slightly elevated spots of a dusky-pink colour. Each spot is flattened on its surface, irregular in outline, with no well-defined margin, but fades insensibly into the hue of the surrounding skin, disappears completely on pressure, and varies in size from a point to three or four lines in diameter. In two or three days, these spots undergo a marked change. They no longer remain elevated above the surrounding cuticle; their hue becomes darker and more dingy than at first, and they now only fade on pressure, instead of completely disappearing. From this state they commonly grow paler, pass into faintly marked reddish-brown stains, and finally disappear. The spots composing this mulberry rash are generally very numerous, close together, and occasionally almost covering the skin. Sometimes, however, they are very few in number, situated at some distance from one another, and not to be distinguished at first from the *rose-spots* which, as will be presently seen, occur in typhoid fever. The mulberry rash is usually situated on the trunk and extremities, but is occasionally limited to the trunk, and in rare cases is seen on the face. No fresh spots appear after the third day of the eruption, and the rash subsides between the fourteenth and twenty-first days. The mulberry rash, though characteristic of typhus when it occurs, is not an essential symptom of the disease. Dr Jenner states, that in patients less than 15 years old, in whom the mortality is not more than 2 or 3 per cent., it is mostly either absent, or pale in hue and scanty in quantity; while in persons upwards of 50 years of age, in whom the mortality is about 56 per cent., the rash is always present, and usually dark and abundant. Hence, as in the case of small-pox, the degrees of development of the eruption may be taken as a direct measure of the intensity of the disease. It is in the course of this second week that death is most apt to occur. Amongst 25 fatal cases noted by Jenner, nine deaths only occurred after the 15th day, and not one after the 20th. If the case is going to terminate fatally, symptoms commonly and expressively termed *putrid*, set in; a peculiar fœtor is exhaled from the breath and the surface of the body; the tongue is dry, black, and fissured; the teeth are covered with dark sordes, and sloughing bed-sores occur. The prostration increases to the last degree, and *subsultus tendinum*, or involuntary twitchings of the muscles of the face and arms, make their appearance. In some cases, the ordinary stupor is replaced a day or two before death by the condition known as *coma vigil.* In this condition the patient never sleeps, but lies on his back, with the eyelids widely separated, the eyes staring and fixed in vacuity, the mouth partially open, and the face pale and devoid of expression. He is totally incapable of being roused to give a sign of consciousness, the pulse and breathing are hardly perceptible, and the skin is cool. The occurrence of death is only marked by the eye losing its slight lustre, and the chest ceasing its slow and feeble movements. During the third week, the symptoms gradually abate in those cases which are going to end in recovery. The patient often falls into a profound, quiet, and prolonged sleep between the 14th and 17th day, from which he awakes with a decided general improvement. The complexion is clearer, the delirium has disappeared, the pulse has fallen, and the tongue begins to shew signs of moisture at the edges. In a few days the tongue gradually becomes clean, the appetite becomes ravenous, and from that time the patient rapidly gains strength. In many cases, the amendment is so gradual, that it is impossible to say when it begins; and occasionally the favourable crisis is preceded by a temporary aggravation of the symptoms. A profuse sweat sometimes accompanies the favourable change. In the cases that terminate fatally, there is no rallying from the symptoms described as occurring in the second week.

The fact that the difference between typhus and typhoid fevers was first recognised only a few years ago, affords sufficient evidence that the symptoms of these diseases must be very similar. In describing *Typhoid Fever* it will consequently be sufficient if we indicate the leading points in which it differs from typhus. Amongst the earlier symptoms (although they are sometimes postponed to the end of the first week), the most characteristic are abdominal pains and diarrhœa. These are due to an ulcerated condition of the intestines, which will be presently noticed. The diarrhœa is either spontaneous, or continues after the operation of a purgative. The stools are loose and frequent; and either of a dark colour and fœtid, or of a yellow pea-soup-like appearance. The abdomen is found on examination to be unnaturally hard and resisting, tympanitic, and sometimes much distended; its shape, as Dr Jenner was the first to remark, 'is invariably the same, and somewhat peculiar. Its convexity is from side to side, and not from above downwards. The patient is never pot-bellied, but tub-shaped; the cause probably being that the flatus occupies the colon, ascending, descending, and transverse.' Pressure over the region of the cæcum frequently excites uneasiness, and usually gives rise to a peculiar gurgling movement, which is both audible and palpable, and doubtless arises from the intermixture of liquid and gaseous matters in the bowels. This gurgling is a still more common symptom at a more advanced stage of the disease, and is of the greater importance since it is rarely met with in typhus or any other disorder. An eruption usually appears at from the 8th to the 12th day of the disease. This typhoid rash is very different from that occurring in typhus; it consists of slightly elevated papulæ or pimples, with their heads rounded, and their bases gradually passing into the level of the surrounding cuticle. These papulæ are circular, and of a bright rose colour, which fades insensibly into the hue of the surrounding skin. Throughout their whole course, they disappear completely on pressure, and reappear when the pressure is removed. Each papula lasts three

or four days, and fresh ones make their appearance every day or two after their first eruption. The number present at a time is usually from six to twenty, but the limits may range from 1 to more han 100. Their average size is a line in diameter,



and they chiefly occur on the abdomen, chest, and back. As a general rule, no fresh spots occur after the 30th day. The diarrhœa, to which reference has already been made, continues with the progress of the disease, the patient often having from three to six evacuations daily, and often unconsciously passing them in bed. This persistence of the diarrhœa is one of the results of ulceration of the bowels. Another result of this ulceration is the occurrence of hæmorrhage from the bowels, which is one of the most alarming of the symptoms of typhoid fever. It occurs most frequently during the third and fourth weeks, and varies from a mere stain to a large amount. Sometimes the blood thus poured out by the ulceration of the mesenteric veins is retained in the bowel, and is only discovered after death; the clots being unable to pass through the valve of the cæcum. This hæmorrhage is always an extremely bad symptom, and may either cause immediate death by fainting, or may so weaken the patient as to cause him to succumb to the disease.

The ranges of temperature in typhoid and typhus fever differ very considerably, and although the range in a mild case of either of these diseases differs considerably from the range in severe cases, the foregoing diagram, copied by Dr Aitken from Wunderlich and Traubeo, shews the typical ranges of temperature in these diseases contrasted throughout their course, from the beginning to the end of the disease. The records indicate morning (M) and evening (E) observations. The *dotted lines* indicate the *Typhus* range, and the *continuous dark lines* indicate the range in *Typhoid*. This diagram is so plain as to require no explanatory details. It is worth while, however, to direct the reader's attention to the rapid changes which in typhoid occur on and after the 22d day, and in typhus about the 15th day. With regard to the duration of the two diseases, Dr Jenner found that the average duration of *fatal* cases of typhoid was 22 days, and of typhus 14 days; the former disease may terminate *favourably* during the fourth week, and the latter from the 13th to the 17th day.

In cases of recovery from typhoid, a remarkable fatuity remains for a considerable time; a childishness of mind often remaining for more than a month after apparent restoration to health. 'The patient,' says Dr Aitken, 'generally wakes up, as it were, from the fever, a complete imbecile. The whole man is changed. He seems to have renewed his youth. Childhood and infancy return, and the greatest care is necessary to prevent untoward events. *No man can be considered as fit for work or for general military service for three or four months after an attack of severe typhoid fever.'—The Science and Practice of Medicine*, 3d ed., vol. i. p. 382.

Typhoid fever is essentially a disease of childhood and adolescence, the average age at which it occurs being $21\frac{1}{4}$ years, and it being very rarely that a person aged more than 50 is attacked; while typhus attacks persons of all ages, from early infancy to extreme old age.

The appearances presented on the examination of the body after death are very different in these diseases. While in *typhus* the most common morbid appearances are a fluid condition of the blood; hyperæmia of the cerebral membranes, and increase of inter-cranial fluid; bronchial catarrh and pulmonary congestion, especially at the posterior part of the lungs, which are more or less collapsed; softening of the heart, liver, and spleen, and enlargement of the kidneys: in *typhoid*, there is one constant and characteristic lesion, viz., a morbid condition of the agminated glands (or glands of Peyer) and solitary glands of the small intestine, and especially of the former. These morbid changes may be briefly summed up as follows: thickening, redness, tumefaction, and finally ulceration or sloughing of the glands, the ulceration always occurring in the lower third of the small intestine. On the assumption that the natural office of Peyer's glands is, as Dr Carpenter suggests, to separate noxious

matters from the blood, and to discharge them into the intestinal canal, Dr C. J. B. Williams suggests that the ulceration so constantly met with in typhoid fever may result from the continued operation of the poison of that disease, thus escaping. When these changes proceed as far as ulceration, the case is one of extreme danger, although death does not necessarily ensue, because the scars left by healed ulcers are often seen when patients, who have had typhoid fever, have subsequently died from some other disease. The existence of these ulcers is, however, likely to prolong the illness after the fever itself has ended; to protract convalescence, and to hinder recovery; and to endanger life, even in cases of apparent convalescence, by causing hæmorrhage or perforation of the bowel. This perforation, which gives rise to intense peritonitis, occurs in about one in five fatal cases, and generally takes place through the ileum near the valve.

We now proceed to notice the origin and mode of propagation of these two diseases, beginning with *typhus*. There is undoubted evidence that all the forms of continued fever are contagious, and it may now be regarded as an established fact, from the investigations of Dr Jenner, that one species of fever cannot generate another, but that each is produced solely by its like; that typhus, for example, always propagates typhus, and never any other form of fever, as typhoid or relapsing fever. Some persons may, by some peculiarity of constitution, be able to resist the action of the poison, while others are peculiarly susceptible to it. An attack of fever generally exerts a certain amount of protective power against another attack of the same kind of fever; and *habit* has a good deal of power in fortifying the system against contagion, just as confirmed drunkards or opium-eaters can with impunity swallow doses of their respective poisons which would prove highly dangerous to a novice. 'Upon this principle,' says Dr Watson, 'has been explained the comparative immunity from contagious diseases, under like circumstances of exposure, of medical practitioners and nurses; of the keepers of filthy lodging-houses, while the new-coming inmates suffer; and even of prisoners, who, without having had the disease themselves, may nevertheless carry forth and communicate the infection, as is said to have happened at the celebrated "black assizes" at Oxford, and again at the Old Bailey in the year 1750.'—*Lectures on the Principles and Practice of Physic*, 4th ed., vol. ii. p. 829. Whether typhus can be generated *de novo* by great over-crowding and vitiation of air, by the organic impurities emanating from the respiratory and other functions, is still a disputed question. The conditions essential to its propagation are (1) overcrowding, combined with deficient ventilation; (2) personal filth, and clothes saturated with cutaneous exhalations; and (3) an impaired condition of the system, such as may result from insufficient food, scurvy, and any other debilitating causes. The patient is most dangerous as a focus of infection after the end of the first week to the period of convalescence, the peculiar odour from the skin and lungs being then the strongest. If the poison be very concentrated, the disease may be caught by exposure to it for only a few minutes. Frequently, the infected person is conscious when the poison is taken in. Dr Banks of Dublin, in an excellent lecture which he delivered on 24th April 1866, in the theatre of the Richmond Hospital, 'On the Origin and Classification of Fevers,' states that this happened in his own case, while examining the chest of a person labouring under the disease. 'The patient,' he observes, 'was seized with cough, and I was so placed that I must have inhaled his breath. The odour was peculiar and intolerably offensive. I was certain that I had imbibed the poison; and after a latent period of three days, I exhibited the usual train of symptoms which usher in typhus of the severest form.' The most common latent period is nine days.

From the investigations of various physicians, amongst whom Dr William Budd deserves especial notice, it appears that the living human body is the soil in which the specific poison of *typhoid* fever breeds and multiplies. The origin of the disease is unknown, but the poison is communicated or contained in the diarrhœal discharges which issue from the diseased intestine. These discharges, as they dry up, preserve the germs of the disease; and if through atmospheric or other agencies, these germs enter the living body, they communicate the disease, and diarrhœa soon commences. As the evacuations contain the specific virus of typhoid fever, the disease may be propagated amongst healthy persons (1) by percolation through the soil into the wells which supply drinking-water; (2) or by issuing, through defects in the sewers, into the air which is inspired; or (3) by exhalation through the apertures of small ill-trapped water-closets or privies, which are at once the receptacles of the discharges from the sick, and the daily resort of the healthy. The atmosphere thus infected with the poison is far more dangerous than that immediately surrounding a fever-patient.

For a knowledge of the means of checking the spread of typhoid fever, society is deeply indebted to Dr Budd's researches; and provided these means are thoroughly and efficiently carried out, it is believed by many of the most eminent physicians that the recurrence of this disease might be entirely prevented. In order to judge of the extent of the infection to be destroyed, there are two points to be considered—viz., *first*, the amount and duration of the intestinal discharge in each case; and *secondly*, the number of cases actually occurring. With regard to the first point, the diarrhœa lasts on an average fifteen days. With regard to the second point, the Reports of the Registrar-general shew that at least 100,000 to 150,000 cases of typhoid fever occur annually in England alone; or, in Dr Budd's emphatic words, 'every year in England, more than 100,000 human intestines, diseased in the way already described, continue each, for the space of a fortnight or thereabouts, to discharge upon the ground floods of liquid charged with matters on which the specific poison of a communicable disease has set its most specific mark.' He suggests the following details of procedure, which should be invariably attended to as soon as this disease appears: 1. All discharges from the fever-patient should be received, on their issue from the body, into vessels containing a concentrated solution of chloride of zinc. 2. Two ounces of a caustic solution of chloride of zinc should be put in the night-stool on each occasion before it is used by the fever-patient. 3. All tainted bed or body linen should immediately on its removal be placed in water strongly impregnated with the same agent. 4. The water-closet should be flooded several times a day with a strong solution of chloride of zinc; and some chloride of lime should also be placed there, to serve as a source of chlorine in the gaseous form. 5. So long as fever lasts, the water-closet should be used exclusively as a receptacle for the discharges from the sick. For further details as to the various precautions to be taken with a view of checking the spread of this and other epidemic diseases, the reader is referred to Mr Simon's 'General Memorandum,' published (in 1860) in his *Third Report on the Public Health in England*.

Although typhoid is contagious, Dr Jenner holds that it is 'infinitely less so than typhus.' Hence

in typhus a large room should, if possible, be selected for the patient, and the air should be kept fresh by having a window or a door, or both, open. Curtains, carpets, and all superfluous furniture should be removed, and the body of the patient should be kept as clean as possible by ablution, and his sheets and night-shirt frequently changed; the latter being at once plunged into water containing chloride of zinc. As the susceptibility to the disease diminishes with the advance of life middle-aged attendants should be selected; and all who approach the sick-bed should avoid as far as possible inhaling the patient's breath or the emanations from his skin. Friends occasionally visiting the patient should do so after a meal and a glass of wine or ale. When typhus patients are received into the general wards of a hospital, they should be scantily distributed amongst the general patients. It is still an open point whether such a distribution or a localisation of all the fever-cases into a special fever-ward or fever-hospital is the most advisable.

From a most careful critical study of the history of fever generally, including chemical and microscopical examination of the excretions, Dr Parkes arrives at the conclusion, that the *general treatment of fever*, including typhus and typhoid fevers, may be summed up 'as being a combination of measures to *reduce excessive heat, to insure proper excretion*, and *to act on the semi-paralysed nerves*.' The special indications for the treatment of *typhus* are: 1. To neutralise the poison, and to correct the morbid state of the blood. Hydrochloric acid is strongly recommended for this purpose; it may be given to the extent of a fluid ounce of the dilúte acid daily, mixed with a quart of barley-water sweetened with syrup of ginger, and flavoured with lemon-peel. 2. To eliminate the poison and the products of the destructive metamorphosis of tissue. For this purpose, alkaline salts may be prescribed to act on the kidneys and skin, and purgatives are often useful. 3. To reduce the temperature. 4. To sustain the vital powers, and to obviate the tendency to death: nourishment in the form of milk and water, coffee, broth, beef-tea, &c., must be administered at least once in every three or four hours, after the fourth day of fever, and alcoholic stimulants are usually serviceable about the seventh or eighth day. Great discrimination is required in prescribing them, and we are mainly indebted to the Dublin school—to Graves and Stokes—for pointing out the importance of the cardiac and radial pulses as guides for the use of alcohol in fevers. When the cardiac impulse becomes weak, and when the first sound of the heart is impaired or absent, stimulants should be freely given; and an irregular, intermitting, abnormally slow, or imperceptible pulse affords a similar indication. 5. To relieve the distressing symptoms, such as the headache, sleeplessness, and delirium; and 6. To avert and subdue local complications.

In *typhoid fever*, the chief indications of treatment are (1) to reduce the temperature, and subdue any vascular excitement that is present in excess; (2) to restrain excessive diarrhœa, for which purpose milk and lime-water in equal parts may be taken as a drink. The discharge ought not to be altogether checked, and Professor Gairdner prefers giving saline laxatives to astringents, and at the same time recommends that the lower bowel should be unloaded by warm-water injections, to which a little assafœtida or aniseed is added. In cases in which it is doubtful whether to check or encourage diarrhœa, the physician will generally be on the safer side if he discourages the action of the bowels. (3) To stimulate the nervous system by proper food, and possibly by stimulants; (4) to maintain the free action of the kidneys, which is best effected by the administration of small doses of the alkaline carbonates or of cream of tartar; (5) to influence the elimination of morbid matter from the affected intestinal glands. For this purpose, 1 or 2 grains of calomel should be given twice a day till about the tenth day, but not later. Special symptoms, such as great inflation of the abdomen (known as meteorism), hæmorrhage from the intestines, &c., must be treated by the ordinary rules. Probably the best single remedy for this form of hæmorrhage is oil of turpentine in doses of from 5 to 20 drops every hour or two. It is best administered in the form of an emulsion with gum-arabic, white sugar, and water. The diet is a subject of the utmost importance from the beginning of the disease till complete recovery ensues. From the various forms of farinaceous food, such as arrow-root, rice, sago, tapioca, bread, &c., from eggs beaten into custard, and milk with or without lime-water (or, preferably, effervescing Carrara water), an abundant, bland, and nourishing dietary can be selected. All animal food, excepting eggs and milk, must be rigidly prohibited. Even beef-tea and mild broths have often been found to exert a special irritant action on the overcharged glands of the ileum. During the period of convalescence, no meat should be allowed till at least a week has elapsed after all the febrile symptoms have vanished, and the only admissible means of opening the bowels are by castor oil or simple enemata.

Both typhus and typhoid fever have been described under various names. Typhus has been popularly known as the jail fever, hospital fever, putrid fever, brain fever, bilious fever, spotted fever, camp fever, &c.; while from the peculiar lesions which are associated with it, the terms enteric fever and intestinal fever have been suggested as appropriate synonyms for typhoid. Its latest name, for which Dr Murchison is responsible, is pythogenetic fever, or fever born of putrescence. If the term *intestinal fever*, suggested by Dr W. Budd, were adopted, much confusion would be prevented.*

Had our space permitted, we should have given a brief historical sketch of the principal epidemics of typhus fever. To confine ourselves to the present century, it may be mentioned, that during its first fifteen years the ravages of typhus in the armies of Napoleon, and among the population of the countries which were the seat of war, were perfectly appalling. In May 1812, the Bavarian army serving with the French numbered 28,000 men; in February 1813, the number was reduced to 2250, the great destroyer being typhus. In Mayence alone, of 60,000 French troops composing the garrison in 1813–1814, there died of typhus alone, in six months, 25,000 men. During the spring of 1856, more than 17,000 men of the French army in the Crimea perished from this disease in less than three months. According to Parkes, typhus fever occupies the fourth place amongst the causes which have produced loss of life in the British army, the three more potent causes being (1) a defective commissariat; (2) undertaking military operations in an unhealthy site, and with an unhealthy season impending; and (3) exposure to cold, with insufficient clothing and food. The present article, comparatively long as it is, contains but a very meagre outline sketch of the history and treatment of two of the most important diseases affecting the human body.—For further details, the reader

* Cases of continued low fever, whether typhus or typhoid, are frequently spoken of popularly and vaguely as *gastric* fevers; but the term is not recognised by the medical profession.

is referred to Aitken's *Science and Practice of Medicine*, 3d ed., vol. i., pp. 374—474, and to Dr Murchison's *Treatise on the Continued Fevers of Great Britain* (1863).

TYR is the old Norse name of a god, who, however, did not belong exclusively to the northern mythology, but was common also to the German, being called in old High German *Ziu* or *Zio*, and in Ang.-Sax. *Tiv*. He was the son of Odin, and was the god of war and of fame, which idea is expressed in old Norse by the word *tyr;* and when the Romans and Greeks speak of a Mars or an Ares among the Germans, it is Tyr that is meant. According to the Edda, he was single-handed. When the Asa-gods persuaded the wolf Fenrir to allow himself to be bound with the bandage Gleipnir, Tyr put his right hand in the wolf's mouth, as a pledge that he would be loosened; and when the gods refused to release him, the wolf bit off Tyr's hand to the wrist, which was called, in consequence, *Ulflithr*, or the Wolf's Joint. In the twilight-battle of the gods, he meets his death at the same time with his enemy, the monster dog, Garmr. The old Norse Runic character ᛏ bore the name of the god. The third day of the week, too, the *Dies Martis* of the Romans, is called after him, in old Norse, *Tyrsdagr;* Ang.-Sax. *Tivesday* (from which our English *Tuesday*); old Friesic, *Tysdei;* old High German, *Ziuwestac;* in the north of Germany, *Tiestac* or *Diestac*, from which the German of the present time, *Dienstag*. Places, and in particular hills and plants, were named after him. The word Tyr appears in epithets of Odin, signifying god in a general sense; as, for example, *Sigtyr*, that is to say, the god of victory; also in epithets of Thor, as *Reidhartyr*, the god of the chariot or of thunder.

TYRANT (Gr. *tyrannos*, Doric for *koiranos*, from *kuros* or *kurios*, a lord or master), a name given in modern times to an arbitrary and oppressive ruler, but originally applied, not necessarily to one that exercised power badly, but merely to one that had obtained it illegally, and therefore equivalent to our word *usurper*. The ancient Greek 'republics,' it must be remembered, were generally aristocratic and even oligarchic in their constitution. When the 'governing families' among the Athenian or Syracusan nobles, for example, quarrelled with each other, it was natural, if they could not otherwise agree, that the boldest and most reckless of the set should seek for success by allying himself with the masses of the people, should figure as their champion, promise to redress their wrongs or increase their comforts, and when a fitting occasion presented itself, should, by a clever if somewhat violent stratagem—*coup d'état*, it is now called—deliver them from the domination of his order by himself grasping possession of absolute power, and ruling without any other restraint than the necessity of retaining his popularity imposed—even this limitation being frequently absent when a body-guard of foreign mercenaries rendered it superfluous. If the political adventurer who thus rose on the ruins of the constitution happened to be a man of sense, and wisdom, and generosity, his 'tyranny' might prove a blessing to a state torn by the animosities of selfish oligarchs, and be the theme of praise in after-ages, as was the case with the 'tyrannies' of Peisistratos (q. v.), Gelon (q. v.), Hiero II. (q. v.), and many others; but if he was insolent, rapacious, and cruel, then he sought to reduce the citizens to a worse than Egyptian bondage, and his name became infamous to all time. Such has been the fate of most of the 'Thirty Tyrants of Athens' (q. v.), more particularly of the blood-thirsty Critias, of Alexander of Pheræ, of Dionysius the Younger, &c. It was the method of exercising authority pursued by these and similar usurpers that latterly, even in ancient times, gave the word tyrant that evil significance it has ever since uninterruptedly retained.—See Plasz, *Die Tyrannis bei den Griechen* (Bremen, 1852); Wachsmuth, *Hellen. Alt.*, vol. i., pp. 279—288; and the Histories of Thirlwall and Grote.

TYRANT SHRIKE, the popular name of a section of the Shrike family (*Laniadæ*), connecting that family with the Flycatchers (*Muscicapidæ*), and entirely American. In the genus *Tyrannus*, the bill is straight, rather long, strong, the upper mandible rounded above, the point suddenly hooked. The birds of this genus are remarkable for their fierce and bold disposition. They are always ready for battle, and often engaged in it. In defence of their young, they rush against any aggressor. The T. S., TYRANT FLYCATCHER, or KING-BIRD (*T. intrepidus*) of North America, has no hesitation in attacking an eagle, rising above him, and pouncing down upon him. This species migrates northwards in summer as far as lat. 57°. It feeds much on the larvæ of insects, but has an unfortunate fondness for bees, and will take its post on a fence or bush near a hive, to dart upon them as they depart or return; on which account it is disliked by American farmers. The true Tyrant Shrikes (*Tyrannus*) have the plumage of white and black, variously blended; but in the genus *Tyrannula*, which approaches more to fly-catchers, the plumage is olive-coloured.

TYRCONNEL, RICHARD TALBOT, EARL OF. See SUPPLEMENT in Vol. X.

TYRE (Phœn. *Sûr* or *Sôr*, rock), a city of ancient Phœnicia, situated in lat. 33° 12′ N., which probably derived its name from the double rock on which it was first founded. It was a matter of doubt among the ancients themselves whether T. or Sidon was the older of the two, and the question is one not easily to be settled. So much, however, seems certain, that T. had existed already independently for a long time, when Sidon, defeated by Ascalon, transferred herself almost bodily to the former (see PHŒNICIA). There were two towns of T. closely connected together in historical times; one on the continent, the other on the island opposite, together embracing about 19 Roman miles. The more important of the two was the continental town, called Palæ Tyrus; while the island-town served more or less for the purpose of store-houses, manufactories, arsenals, and the like. The situation of the entire city was one of the most fertile, and its magnificent combination of land and sea scenery formed the theme of many an ancient poet and seer.

Nothing but myths have come down to us respecting the earlier period of its existence. History begins to dawn upon us with Abibal, the predecessor of the biblical Hiram, under whose rule (980—947 B.C.) T. attained to its full glory and renown. An alliance with Solomon was also entered into; trading expeditions were undertaken jointly by the Israelites and the Phœnicians, and Solomon is supposed even to have married Hiram's daughter. During Hiram's reign, T. was much enlarged and embellished; and its two roadsteads and harbours, the wonders of the ancient world, probably date from the same period. He was followed, according to ancient writers, by Balæastartus; after him reigned, for brief periods, his four sons, by the murder of the last of whom the throne became hereditary in the house of Ithobaal, the Ethbaal of Scripture, whose daughter was married to Ahab. T. then appears to have gained the supremacy over Sidon, and also spread her colonies far and wide. Shortly after the death of the king, Carthage was

refounded by Elissa (Dido), about 813 B.C., in consequence of a popular demonstration, which deprived her of the throne in favour of Pygmalion. This 'new city' gradually diminished the importance of the old one; at least T. seems to have been weakened to such an extent by the emigration of its best elements, that it disappears from history until the three great powers, Chaldæa, Assyria, and Egypt, by turns endeavoured to make themselves masters of the Tyro-Phœnician coast, with its eastern and western trade. Shalmaneser, king of Assyria, reduced T., after a long siege; and the whole of Phœnicia, the most important places of which had already thrown off their allegiance to T., was rendered tributary to Assyria. During the Chaldæo-Egyptian struggle, T., again at the head of the country, sided with Egypt, and was conquered by the Chaldæans. Once more the Phœnicians attempted to throw off the foreign yoke, and Nebuchadnezzar marched against them at the head of his armies. Having taken Jerusalem (587 B.C.), he reduced the which sea-coast, except T., which stood a thirteen years' siege by water and by land, ending, not in subjection, but only in a kind of apparent submission, leaving the native sovereigns on their thrones, and their wealth and power untouched. In 538 B.C., Cyrus became master of Phœnicia, which at that time again stood under Babylonian supremacy, and the hegemony was bestowed upon Sidon. For a long time, Phœnicia prospered under wise Persian rulers; but when Xerxes, in his Greek wars, had completely destroyed the Phœnician fleet, and exhausted nearly all her resources, the exasperated inhabitants rose once more, but only to be utterly crushed. Sidon, at the head of the revolution, was fired by its own inhabitants, and once more T. resumed the lead (350 B.C.). Having refused to pay allegiance to Alexander the Great (after the battle at Issus), it was besieged by him in 332 B.C., and fell after a seven months' hard resistance. Alexander replaced the old inhabitants by new colonists, chiefly Carians, and though the city had sustained all but complete destruction, it yet rose again after a very brief period to wealth and power, and already in 315 B.C., was able to hold out for 18 months against Antigonus. Under the Romans, Cleopatra received T. as a present from Antony; but the last trace of its independent existence was taken from it by Augustus. A Christian community was founded there at an earlier period. The trade and manufacture of T., aided by her exceptionally favourable naval position, insured for it, even under Roman dominion, a high place among its sister cities; and once more, in 193 A.D., it even took an active part in the contest between Septimius Severus and Pescennius Niger, which, resulting in the success of the former, brought back to it some of its ancient distinction. In St Jerome's time, it was again the noblest and most beautiful city of Phœnicia, nay, one of the most prosperous and noble cities of the whole East. In the 7th c., it came under the dominion of the Saracens, and so remained until taken by the Crusaders; and in 1192 A.D. became the northern boundary of Christian territory in Palestine. It continued to flourish—still chiefly through its world-renowned purple—until 1516 A.D., when the conquest of Selim I., together with the newly discovered route to Asia by the Cape of Good Hope, put an end to its wealth and commerce, and almost to its existence. Although there has been a slight improvement in its prospects of late, the desolation and wretchedness of that once magnificent city are still most striking. From 3000 to 4000 inhabitants now dwell among the ruins of its ancient glory, finding very livelihood in insignificant exports of tobacco, cotton, wool, and wood. Frederick Barbarossa and Origen are both buried here.

TY'RNAU (Magyar *Nagy-Szombath*), a town of Hungary, county of Ober-Neutra, on the river Trna, about 30 miles north-east of Presburg. It has so many churches and convents that it has been nicknamed 'Little Rome.' T. carries on manufactures of cloth, linen, woad, &c., and has a tolerably lively general trade, especially in wine. From 1635 to 1774, it possessed a university, which in the latter year was transferred to Pesth. T. is likewise famous for a huge cask, which can hold twice as much as the great Heidelberg one. Pop. 7600.

TY'ROL, THE, the most western province of the Austrian Empire, lying in 45° 40′—47° 44 N. lat., and 9° 32′—12° 55′ E. long., is bounded on the N. by Bavaria, on the E. by Salzburg, Carinthia, and Venetia, on the S. by Italy, and on the W. by Switzerland and Italy. Area, 12,311 sq. miles; pop. in 1880, 912,549.

Surface.—The T. may be regarded as an eastern continuation of Switzerland. It is traversed from east to west by the great chain of the Alps, and is encircled on all sides by lofty ranges. It consists, however, almost entirely of three great valleys—(1) one running east and west north of the Great Alps, and drained by the Inn; (2) one south of the Alps, also running east and west, and drained by upper tributaries of the Adige or Etsch; (3) one running south from the middle of the last, and drained by the main stream of the Adige. These valleys are surrounded by a circuit of mountains. The northern valley is separated from Bavaria by the Algau Alps. The southern valley is bounded on the E. by the Trent Alps; on the W. by the Ortler Alps, which, like protecting walls, run south into the plain of Lombardy. The main chain is crossed towards the centre of the T. by a deep depression, in which lies the Brenner Pass (elevation, 4657 feet). It is the lowest of the great passes of the Alps, and that over which runs the great commercial route connecting Italy and Germany.

The dialect and manners of the Bavarians prevail in the northern and middle valley. The dialect and manners of Lombardy, on the other hand, have crept up the third valley to a boundary-line which rests upon the mountains which bound the middle valley on the south. Hence the most important divisions of the T. are into the German Tyrol and the Italian Tyrol. The German T. is divided into (1) the Oberinnthal, or the Upper Inn Valley; (2) the Unterinnthal, or the Lower Inn Valley; (3) the Vintschgau; (4) the Etsch district; and (5) the Pusterthal, the three last belonging to the middle valley of the Tyrol. Beyond the geographical limits of the T., the Austrian province of the T. includes (6) the Vorarlberg, a district drained by streams which fall into the Lake of Constance, and in which a dialect is spoken resembling those of German Switzerland; and (7) the Lienz district, on the Drave, in which the language of the people is Austrian. The Italian T. is divided into (1) a northern valley, or that of Trent; (2) a southern valley, or that of Roveredo; (3) the valley of the Sarca, or district of Riva, on Lake Garda.

Geology and Soils.—The rocks of the T. are chiefly crystaline Silurian and Secondary, with obtruding granites and traps. The chief mineral products are iron, rock-salt, worked near Innsbruck, and marble quarried in the south. The Tertiary strata of the Swiss and Swabian plains are totally wanting; and it is only along the water-courses that level tracts of recent formation are found. These tracts are the only parts of the country admitting of cultivation by the plough, and they very seldom attain a width

of more than half a mile. Taken altogether, they do not form more than one-tenth of the whole country

Climate.—The loftiest mountains of the T. are in the main chain of the Alps—the Gross Glockner (12,776 feet), east of the Brenner Pass, and Mount Gebatsch (12,276 feet) west of it, and, in the Ortler chain, the Ortler Spitz (12,818 feet). These mountains are covered with vast glaciers, which descend, like those of Switzerland, far into the valleys. Between 6000 and 5000 feet, snow disappears in summer, and alpine plants and grass cover the hills, diversified here and there with stunted bushes. Into this region the herds are driven, as in Switzerland, during the summer months. Below 5000 feet, the fir-woods abound; potatoes and a few vegetables are cultivated, and houses permanently occupied make their appearance. The beech replaces the fir at 4000 feet, and agriculture begins, the chief grains being rye and barley. Wheat is not cultivated with success at a higher elevation than 2000 feet. In the lower part of the southern valley, the temperature is highest, and indeed the climate is that of Northern Italy; tobacco, the fig, the olive, and the mulberry being enumerated among the chief objects of cultivation. Out of every 100 acres of the T., 30 are inaccessible mountain-tracts, 40 forests, 20 commons and meadows, and 10 corn-fields and gardens.

Industry.—The industry of the T. is not important. There are, however, glass and paper factories near Innsbruck; and carpets, linens, gloves, and straw-hats are manufactured extensively for home consumption. Wooden ware is also largely produced. The rearing of canaries is a business which was long a monopoly of the northern Tyrolese, who supplied all Europe with these birds. The exports from the T. consist of cattle, cheese, timber, wine, tobacco, silk, iron, and salt. The imports are grain and manufactured goods. The transit-trade between Italy and Germany gives employment to a large number of the inhabitants. Thousands migrate annually into neighbouring countries, to sell their wood-wares, gloves, and carpets. Railways have for some time connected Innsbruck with Munich, and Botzen and Trent with Verona. One is in progress over the Brenner Pass, which will connect these, and complete the communication by railway between Italy and Germany.

Inhabitants.—In 1868 the northern or German Tyrolese bore to the southern, or Italian, the proportion of five to three. The habits and language of the people resemble those of the adjoining parts of Italy and Germany. In the T., according to the census of 1857, the inhabitants were all Catholics, with the exception of 548 Jews, 74 Protestants of the Augsburg Confession, 41 of the Reformed Church, and 1 Unitarian. The Tyrolese have an independent national diet, meeting at Innsbruck, in which are represented all classes of the population, the clergy, the nobility, the people of the country, and those of the towns. There are, to some extent, separate administrative arrangements for the Italian districts. Education is now very generally diffused, and one of the nine Austrian universities is at Innsbruck.

History.—The history of the T. is partly German and partly Italian. In early times, the T. formed part of Rhætia, and was conquered by the Romans, 15 B.C. Subsequently it was overrun by various German tribes; still later the southern valley fell to the share of the Lombards, the two northern valleys to the Bavarians. The latter valleys were divided into *gaus*, which ultimately became petty lordships, acknowledging the supremacy of the dukes of Bavaria. These lordships, however, in the course of time, came to be represented by two families who intermarried. Then the whole German T. was governed by one family of counts, whose paternal abode was the mountain fortress of Terioli, or Tyrol, near Meran. The last count, who died in 1335, left one daughter, Margaret Maultasche. She bequeathed her rights to her cousins, the dukes of Austria, who, in consequence, acquired possession of the T. in 1363. The Italian valley formed the bishopric of Trent. During the wars of Napoleon, the German T. was ceded to Bavaria, much to the discontent of the population, who were warmly attached to the House of Austria. They made a gallant resistance to the French in 1809, under Andreas Hofer, but were defeated; and the Northern T. was not restored to Austria until the Treaty of Paris in 1814. The Southern T., which had been annexed to Italy, was restored to Austria in the following year. An application was made by the inhabitants of the Italian T., a few years ago, to the Austrian government to be rendered entirely independent of the German inhabitants of the northern valleys; but it led to no important change in the administration. It shewed, however, the desire of the Southern Tyrolese to be considered Italians rather than Germans, and it was believed that on the event of a successful war for the recovery of Venice, the whole of the Southern T. would be handed over to the kingdom of Italy. This expectation has not been realised. By the treaty of peace between Austria and Italy (a summary of which appeared in the *Times*, October 12, 1866), it is declared that the frontiers of the Venetian provinces ceded to Italy are the administrative frontiers of these provinces under the Austrian rule. Even the shores of Lake Garda remain Austrian. How long this arrangement will last, it is hard to predict. The trade of the Southern T. is entirely with the south, its wood and cattle being exchanged for the corn of Lombardy, and it is asserted that if any attempt is made to enforce custom-house regulations on the frontier, the inhabitants will not rest satisfied until they have secured the annexation of their territory to Italy.

TYRO'NE, an inland county of the province of Ulster, Ireland, bounded on the N. by Londonderry, on the E. by Armagh and Lough Neagh, S. by Monaghan and Fermanagh, and W. by the last-named county and Donegal. A portion of Lough Neagh is assigned by the Ordnance Survey to this county; and, including this portion, the whole area is 1260 sq. m., or 806,640 acres, of which 450,286 are arable, 311,867 uncultivated, 31,796 under water, 11,981 in plantations, and 710 in towns. The pop., in 1871, was 216,668, of whom 119,890 were Roman Catholics, 49,499 Protestants of the Established Church, and 42,040 Presbyterians. The pop. in 1881 was 197,719. Of the arable land, in 1872, 267,252 acres were under crops of various kinds. In the same year, the stock amounted to 24,417 horses, 180,302 cattle, 55,691 sheep, and 42,257 pigs. The surface, in general, is hilly, and often extremely picturesque, this county lying for the most part between the two great mountainous districts which traverse Ulster from east to west. With the exception of Lough Neagh, the lakes, which are numerous, are small. The principal rivers are the Blackwater, the Camowen, and the Ballinderry, of which the two former are navigable. The county is traversed by railways, which connect it with Dublin, Belfast, and the sea-coast at Dundalk. The geological structure is very much diversified. The north-western mountains are chiefly mica-slate, with primitive limestone, and rise in Slieve Sawel to a height of 2236 feet. Those on the north-east are of greenstone, with granite and occasional red sandstone. The plain, of which Omagh is the centre, is a Tertiary

formation, with irregular beds of lignite, red marl, and new red sandstone; and between Dungannon and Stewartstown there is a small coal-field, the produce of which is rich, and resembles the coal of Ayrshire. The rest of the plain belongs to the general limestone district. The climate is moist, and the low lands are often flooded. The soil of the plain is a fertile loam; that of the hilly districts, sandy or gravelly. There is a large proportion of bog, the turf of which supplies the chief part of the fuel consumed by the population.

The chief towns are Omagh, Strabane, Dungannon, Cookstown, Aughnacloy, Castlederg, and Clogher, which gives its name to the episcopal see. T. returns three members to the imperial parliament, two for the county, and one for the borough of Dungannon.

T. was anciently known as the district of Hy-Briun and Hy-Fiachra; and in later Celtic times was called Kinel Eogain, or Tir-owen, whence its modern name. See ULSTER.

TYRRHENIAN SEA (anc. *Tyrrhenum Mare*), that part of the Mediterranean Sea (q. v.) between the islands of Corsica, Sardinia, and Sicily on the west, and the Italian peninsula on the east.

TYRTÆ'US, famed for his political elegies and marching-songs, was the son of Archembrotus, of Aphidnæ, in Attica; according to another conjecture, he was a Lacedæmonian; while the story which represents him as a lame schoolmaster, of mean family, whom the Athenians (ignorant of his lyric power, and jealous of Lacedæmonian domination in the Peloponnesus) sent to the Lacedæmonians, during the second Messenian war, as the most inefficient commander they could select, must be received as a fiction of later times. He rendered, however, to the Lacedæmonians a kind of assistance which the Athenians little foresaw; and while by his elegies he stilled their dissensions at home, by his war-lyrics, he so animated their courage in the field, that they were finally triumphant in their conflict with the Messenians, whom they reduced to the condition of Helots. This success of his poems T. lived to see, and must accordingly have flourished down to 668 B.C., the last year of the second Messenian war. The best edition of the text of T. is that of Bergk in his *Poetæ Lyrici Græci*.

TYTLER, WILLIAM, the author of several literary works of considerable merit, the principal being an *Inquiry, Critical and Historical, into the Evidence against Mary Queen of Scots*, in which it is attempted to vindicate that unhappy princess from the charges brought against her by Robertson and Hume. T. was born at Edinburgh in 1711, educated in Edinburgh, admitted a member of the Society of Writers to the Signet in 1742, and died in 1792. He was father of Alexander Fraser Tytler, Lord Woodhouselee, and grandfather of Patrick Fraser Tytler the historian. T. was an accomplished musician, and distinguished for his general culture and taste in the fine arts.

TYTLER, ALEXANDER FRASER, a historical writer, and a judge of the Court of Sessions in Scotland under the title of Lord Woodhouselee. He was the eldest son of William Tytler (q. v.), the vindicator of Queen Mary, and was born at Edinburgh in 1747, educated principally in Edinburgh, and admitted to the Scottish bar in 1770. He obtained, in 1780, the professorship of History in the university of Edinburgh; in 1790, the office of Judge-admiral of Scotland; and in 1802, was raised to the bench of the Court of Session. His acquirements were of the most varied kind, embracing most departments of literature and the fine arts. His writings include a biography of Henry Home, Lord Kames; a Dictionary of Decisions of the Court of Session; and the work by which he is best known, his *Elements of General History*, first published in 1801, which has been translated into most of the languages of Europe, and even into Hindustani. He died in 1813.

TYTLER, PATRICK FRASER, an eminent historical writer, fourth son of Alexander Fraser Tytler, Lord Woodhouselee. He was born in 1791, educated partly in Edinburgh, partly in England, and called to the Scottish bar in 1813. Of his various literary and historical works, the most valuable is his *History of Scotland*, beginning at the accession of Alexander III., and terminating at the union of the crowns, a book of more critical research than any work on the same subject that had preceded it. His writings also include a life of the Admirable Crichton, a life of Wickliffe, a memoir of Sir Thomas Craig, and a collection of original letters, illustrative of the reigns of Edward VI. and Mary. In consideration of his merits as a historian, Sir Robert Peel's government conferred on him a pension of £200 a year. He died at Malvern, 24th December 1849. His talents were such as qualified him in a remarkable degree to shine in society, and his amiable and excellent private character have been the subject of deserved eulogy.—See Burgon's *Life of Patrick Fraser Tytler* (1859).

TZETZES, JOHANNES, a Byzantine (Greek) author flourished during the latter half of the 12th c., is known as the author of certain works in prose and verse, which, though excessively dull, and without a vestige of literary genius, are valuable as storehouses of classical information, not elsewhere to be had. The principal are—1. *Iliaca*, consisting of three distinct poems, entitled *Ante-Homerica, Homerica*, and *Post-Homerica;* or in Greek, *Ta pro Homerou, ta Homerou, kai ta meth' Homeron;* a complete edition of which was first published by Fr. Jacobs (Leip. 1793), but the most critical edition is that of Bekker (Berl. 1816); 2. *Biblos Istorike*, more commonly called *Chiliades*, or a collection of more than 600 stories, mythical, legendary, &c.; best edition that of Kiessling (Leip. 1826), written in that worthless sort of verse, called *political*, which had regard only to syllables, and not to quantity; besides commentaries on Homer, Hesiod, and the *Cassandra* of Lycophron. Several poems and commentaries of T. exist in MS., that have never yet been published.—T. had a brother, ISAAC, who probably had some share in the commentary on the *Cassandra*.

U

U THE twenty-first letter of the English alphabet, represents in that language three distinct sounds, as heard in *tube*, *tub*, and *full*. The last is its primitive sound, which it had in Latin, and which it has preserved in German and Italian, but which is oftener denoted in English by *oo*. In *tube*, it does not mark a pure vowel sound; it is aspirated, as if *y* were prefixed—*tyub*. The sound heard in *tub* is characteristic of English; and, owing perhaps to the decided emphasis given to one syllable of a word at the expense of the rest, there is a tendency to allow the other vowels, *a*, *e*, *o*, when unaccented, to degenerate into this indistinct, stifled sound: *cavalry*, *sister*, *fashion* are pronounced almost, if not altogether, as if written *cavulry*, *sistur*, *fashun*. This is especially the case with *o*; and in this vowel the degeneracy is not confined to unaccented syllables; in a whole host of words, the accented *o* is exactly equivalent to *ŭ*—e. g., *come*, *money*, *among*. Perhaps a similar tendency in Latin may account for the prevalence of *u* in that language as compared with Greek—e. g., Lat. gen*u*s = Gr. gen*o*s; vol*u*mus = boul*o*metha; spat*u*la = spat*a*le; scop*u*l*u*s = skop*e*l*o*s. *U*, in Latin, sometimes goes into the still thinner sound of *i*; thus *maxumus*, *caputis*, degenerated into *maximus*, *capitis*. Of the labial series of vowels (see Letters), *u* approaches nearest to the labial consonants; so much so, that in Latin the vowel *u* and the consonant *v* were both denoted by the same character, *v*, of which *u* is only a later modification. In the middle ages, the two characters were used indifferently whether as vowel or consonant; and it was only in the 16th c. that the Dutch scholars fixed the use of the character *u* for the vowel, as distinct from *v*.

UBE'DA, a town of Spain, Andalusia, in the modern province of Jaen, stands on an olive-clad slope in a cultivated plain, 26 miles north-east of the town of Jaen. It contains some fine specimens of architecture, of which the chief is the cathedral. It was built by the Moors, and under them it is said to have contained 70,000 inhabitants. There are now only about 15,000, who are engaged in agriculture, in the manufacture of porous vessels, made of red and white clay.

UCAYALI, river. See Supplement in Vol. X.

U'DAL RIGHT, in the Law of Scotland, means that right in land which may be completed without charter and sasine by undisturbed possession provable by witnesses before an inquest. Though dependent on the crown as superior, the vassal pays only a tribute called skat. The right is said to have been the old tenure prevalent in Britain before the feudal system was introduced, and prevails chiefly in Orkney and Shetland. The lands held on udal right are now commonly converted into feus.

UDI'NÉ, a city of Northern Italy, Venetia, capital of the province of the same name, called also the province of Friuli, situated in a fertile plain, about 75 miles north-east of Venice by railway. It is a walled town, 4 miles in circumference, with wide, handsome streets and squares. The castle, which stands on a hill in the midst of the city, was formerly the residence of the patriarchs of Aquileia, and is now the seat of the tribunals. The Antonini Palace is a work of the architect Palladius. U. trades in silk, in copper utensils, and rosolio. There are leather, paper, and silk factories. Pop. about 20,000. Two miles from U. stands the village of Campoformio, where, in 1797, the treaty between Bonaparte and Austria was signed, by which Venice was ceded to the latter.

U'FA, a government of Russia, formed in 1865 out of the five north-western districts of Orenburg, and separated from the present government of Orenburg by the south-west branch of the Ural Mountains. See Orenburg.

UFA, capital of the government of the same name, on the right bank of the Biëlaia, or White River. It was built in 1573, in the reign of Ivan IV. It contains 12 churches and 24 manufactories, the principal articles of trade being honey, wax, fat, furs, and skins. The Biëlaia, an affluent of the Kama, and thus connected with the Volga, is here navigable for large ships. Pop. 20,000.

UGLI'TCH, a town of Great Russia, in the government of Jaroslav, on the right bank of the Volga, 488 miles south-east of St Petersburg. In early times, it was the chief town of an independent principality of the same name. After the assassination at U. of Prince Dmitri, son of Ivan IV., in 1592, the majority of the inhabitants of the town were banished to Siberia and other distant quarters, and the town, formerly prosperous, became deserted. U. contains 24 churches, 2 cloisters, and 14 manufactories—linen, weaving, and tanning being the principal branches of industry. Pop. 13,126.

UHLAND, Joh. Ludwig, a celebrated German poet, was born at Tübingen, 26th April 1787, studied at the university of his native city, and first appeared as a writer of verse in Seckendorf's *Musenalmanach* (1806—1807). For several years he continued to publish ballads and other lyrics in various periodicals, the first collection of which, under the title of *Gedichte*, appeared in 1815. To this he kept adding all the rest of his life, and it is on these *Gedichte* that his fame rests. Their popularity has been, and continues to be as great as it is merited, upwards of a dozen editions having been published. Other productions of U.'s are his admirable essays, *Ueber Walther von der Vogelweide* (Stuttg. 1822), and *Ueber den Mythus der nord. Sagenlehre vom Thor* (Stuttg. 1836); a masterly collection of old popular songs (*Alter hoch und niederdeutscher Volkslieder* (Stuttg. 1844—1845); and two dramas *Herzog Ernst von Schwaben* (Heidelb. 1817), and ***Ludwig der Baier*** (Berl. 1819). He died at Tübingen,

13th November 1862. U. was a patriotic politician as well as a poet. He entered the representative assembly of Würtemberg in 1819 as deputy from Tübingen, and proved an active member of the liberal party. He was also a delegate to the Frankfürt Assembly of 1848; but though Germany has reason to be grateful for his services to the cause of constitutional liberty, it is as a poet he will be best remembered. His pieces are full of spirit, imagination, and truth, finely picturesque in their sketches of nature, and exquisite in their varied tones of feeling. Nothing, indeed, can surpass the brevity, vigour, and suggestive beauty of his ballads, in which a romantic sweetness of sentiment and a classic purity of style are happily combined. U. is the acknowledged head of the 'Suabian School' of German poets. See Pfizer's *Uhland und Rückert* (Stutt. 1837). Longfellow has translated some of U.'s ballads, in his *Hyperion*, into English; and Mr Platt has published a volume of translations (Lond. 1848), with a memoir prefixed.

U'HLANS (a Tartar word signifying 'brave'), light cavalry of Asiatic origin, were introduced into the north of Europe along with the colonies of Tartars who established themselves in Poland and Lithuania. They were mounted on light active Tartar horses, and armed with sabre, lance, and latterly with pistols. Their lance was from 5½ to 6½ feet in length, and like that of the modern 'lancers,' was attached to a stout leather thong or cord, which was fastened to the left shoulder, and passed round behind the back, so as to allow the lance to be couched under the right arm. Immediately below its point was attached a strip of gaudy-coloured cloth, the fluttering of which was designed to frighten the enemies' horses. The early dress was similar to that of the Turks, and the regiments, or *polks*, were distinguished from each other by the red, green, yellow, or blue colour of their uniforms. The Austrians and Prussians were the first to borrow this species of cavalry from the Poles. In 1734, an attempt was made by Marshal Saxe to introduce the U. into France, and a 'polk' of 1000 men was formed; but it was disbanded at its author's death. The Prussian Uhlans won great renown in the Franco-German war of 1870—1871 by their bravery and marvellous activity. The Prussians applied the term, however, rather loosely, including all their light cavalry under the designation.

UIST, NORTH AND SOUTH, two islands of the Outer Hebrides, are situated from 15 to 18 miles west of the Isle of Skye, from which they are separated by the Little Minch. Unlike the other islands of the Hebrides, the east coasts of North and South U. are much and deeply indented, while the west coasts are, as a rule, almost unbroken.—NORTH U., between which and *South U.* the island of Benbecula intervenes, is 18 miles long from west to east, and from 10 to 3 miles in breadth. The eastern half of it is so cut up by lochs and watercourses as to have the appearance of an archipelago. This region is a brown, peaty, dreary bog, partly relieved, however, by a line of low hills running along the coast at the distance of about 2½ miles. In the west part, which, as a rule, is hilly, there is a tract of uneven, low land, exceedingly beautiful in certain seasons, rendered fertile by the drifting of shell sand from the coast, and producing good clover and grain crops. Population, 3371.—SOUTH U., 20 miles long, and 7 miles broad. Its east coast is much indented by the lochs Skiport, Eynort, and Boisdale. The eastern district is upland; the western is alluvial and productive, under proper treatment. Pop. 3669, engaged, like the inhabitants of North U., in fishing and agriculture.

UJEI'N, one of the seven sacred cities of Hindustan, in Sindia's dominions, of which it was formerly capital, stands on the right bank of the Sipra, 35 miles north-north-west of Indore. It is surrounded by walls with round towers, is six miles in circumference, contains the grand palace of the head of the Sindia family, several mosques and mausoleums, an observatory, and an antique gate, supposed to date from before the Christian era. An active trade is carried on in cloths, opium, &c. The number of the inhabitants is not ascertained.

U'JHELY-SATORA'LYA, a market-town of Hungary, 105 miles north-west of Pesth. It stands on the Hegyalya Mountains, contains several churches and a gymnasium, and is noted for its wine-culture. Pop. 7200.

UKA'SE, or UKAS (Russian *ukasat*, to speak), a term applied in Russia to all the orders or edicts, legislative or administrative, emanating from the government. The ukases either proceed directly from the emperor, and are then called *imenny ukas*, or are published as decisions of the directing senate. Both have the force of laws till they are annulled by subsequent decisions. Many ukases are issued in the course of one reign; and as an immense chaos of ukases had accumulated since 1649 (the date of the last codification of laws), the Czar Nicholas ordered (1827) that a collation of them should be made. The result was a collection of laws in 48 volumes, which has been supplemented year by year by volumes of new ukases, and which, after the elimination of such ukases as are unimportant or of temporary authority, constitutes the present legal code (*svod*) of the Russian Empire. The *prikases* are imperial 'orders for the day,' or military orders given during a campaign.

UKRAI'NE (Slav. a frontier country or March), the name given in Poland first to the frontiers towards the Tartars and other nomads, and then to the fertile regions lying on both sides of the middle Dnieper, without any very definite limits. The U. was long a bone of contention between Poland and Russia. About 1686 the part on the east side of the Dnieper was ceded to Russia (Russian U.); and at the second partition of Poland, the western portion (Polish U.) also fell to Russia, and is mostly comprised in the government of Kiev. The historic U. forms the greater part of what is called Little Russia (a name which first appears about 1654), which is made up of the governments of Kiev, Tchernigov, Poltava, and Kharkov.

ULCERA'TION is 'that part or effect of an inflammatory process in which the materials of inflamed tissues liquefy or degenerate, are cast off in solution or very minute particles from free surfaces, or, more rarely, are absorbed from the substance of the body.'—Paget on 'Ulcers,' in Holmes's *System of Surgery*, vol. i. p. 197. Generally speaking, however, the name of ulcer is not applied to any inflammatory result, unless the substance of a tissue deeper than the epithelial is exposed; and when the cast-off particles are only epithelial, the result is termed desquamation, abrasion, or excoriation, although the process may be essentially the same. Ulceration is closely allied to gangrene, the two processes differing in degree rather than in kind. 'When the degenerate or dead substance,' says Mr Paget, 'is cast off in one or more portions visible to the naked eye, the process is usually called gangrene; when the portions are not so visible, or are quite dissolved, it is called ulceration.' The degenerate tissues are always suspended or dissolved in a liquid, termed the 'discharge,' or 'ichor,' which varies in appearance and properties according to the cause and characters of the ulcerative

process. 'From some ulcers, e. g., the primary syphilitic, it is contagious; from many, it appears corrosive, exciting by its acridity inflammatory changes in the tissues with which it is in contact.'

ULCERS (derived from the Latin *ulcus*, a wound) may be arranged either according to the constitutional or specific disease from which they are derived, or according to the characters which they present. According to the first system, we speak of ulcers as healthy, inflammatory, strumous, &c.; while, according to the second, they are named irritable, chronic, sloughing, &c. In this article, we shall adopt the former of these arrangements, as being, upon the whole, the most satisfactory, although each possesses its own advantages.

A *common, simple, or healthy ulcer* is such as is left after the separation of an accidental slough in a healthy person, and is merely a healthy granulating surface, tending to cicatrisation. Its edges shelve gently down to the base, and are scarcely harder than the adjacent healthy skin. Their surface near the border is of a purplish blue tint where the young epidermis modifies the colour of the healing granulations; and within this, the granulations have a deeper hue than those at the centre, being most vascular where the cuticle is being chiefly developed. The discharge from such an ulcer is healthy or 'laudable' pus. The only treatment required is a little dry lint, if there is much discharge; or the water-dressing, if the sore is comparatively dry. When the granulations are too luxuriant, they must be touched with nitrate of silver, and dressed with dry lint. *Inflammatory ulcers* differ less than most kinds from the above described common or healthy ulcers. They commonly arise from some trifling injury, such as a blow or slight abrasion of the skin, which, to a healthy person, would have done no harm. Their most common seat is on the lower half of the leg or shin. The surface is red, and bleeds easily; the discharge is thin and watery; the edges irregular or shreddy; and the surrounding skin shews a red tinge, and is the seat of a hot and aching sensation. This ulcer most commonly occurs in the infirm and old, the ill-fed and overworked. Hence constitutional treatment, good diet, and complete rest (with elevation of the limb) are here demanded, in addition to water-dressing or lead-lotion applied warm. *Senile ulcers* usually present very little discharge, exhibit granulations of a rusty red tint, and are surrounded by a dusky red area. Nourishing food, wine, bark, and the mineral acids are here required, and opium in small repeated doses is often serviceable. The local treatment must be of a stimulating nature; and in bad cases, Mr Paget recommends strapping the leg daily with a mixture of resin ointment and Peruvian balsam spread on strips of lint. *Strumous* or *scrofulous ulcers* usually occur as the consequence of scrofulous inflammation in the subcutaneous tissue or lymphatic glands. They most commonly occur in the neck, groins, cheeks, scalp, and the neighbourhood of the larger joints. The discharge is thin, and of a greenish-yellow tint. These ulcers are seldom very sensitive or painful. The general treatment must be that recommended for constitutional Scrofula (q. v.). Iodine, in some form or other, is the best local application. A poultice of bruised and warmed sea-weed is a very popular remedy; but there is probably nothing so efficacious as tincture of iodine diluted with water till it causes only a slight discomfort, and applied three or four times a day. (About 30 drops of the tincture may be added to an ounce of water, to begin with.) Of the numerous other species distinguished by Mr Paget, we shall briefly notice the *Varicose, Indolent*, and *Sloughing Ulcer*. *Varicose Ulcers* are connected with an enlarged or varicose state of the veins of the lower extremity, which weakens the parts, and renders them especially liable to ulceration. See VARICOSE VEINS. The *chronic, indolent, or callous ulcer*, beyond all doubt, gives more trouble to the poor-law medical officer and the workhouse surgeon than any other half-dozen surgical affections. It is usually seated in the lower half of the leg, and is most commonly of an oval form, with its long axis parallel to that of the leg. 'Its base lies deep, and is flat, pale, or tawny and dusky, with very minute or no visible granulations. The margin is usually abrupt, or unequally shelving, and in its most characteristic form, strictly overlaid with opaque, white, dense epidermis.'—Paget, *op. cit.*, p. 217. Many volumes have been written on the proper means of treating this form of ulcer. The distinguished surgeon from whose Memoir we have so largely quoted, especially recommends opium, regulated pressure, and blistering. A grain of opium night and morning is usually sufficient. The pressure is applied with straps of adhesive or lead plaster on linen. The object of blistering is not only to stimulate the ulcer, but to soften its callous edges by causing absorption of part of the exudation with which they are infiltrated, and desquamation of the cuticle which covers them. The expediency of healing old ulcers of this kind has often been called in question, inasmuch as apoplexy, palsy, mania, and other serious diseases are said to have followed the healing of such ulcers. In the following cases, it may be decided that a cure should not be attempted. (1) If the ulcer be affected by the gout, having regular attacks of pain, returning at stated periods, and similar to what the patient has experienced from gout in other parts. (2) If an ulcer habitually occur whenever the constitution is disordered. (3) If the patient be very infirm and old; for under these circumstances the removal of a habitual source of irritation, or the diversion of a habitual efflux of blood, may prove fatal; and especially as very old ulcers have been known to heal spontaneously a short time before death. To these cases, specified by Sir E. Home, Dr Druitt adds (4) that of ulcers on the legs of stout women about the critical period of life, and displaying a tendency to discharge profusely as the menstrual discharge diminishes. To counteract these dangerous tendencies, the bowels should be freely purged during, and for some time after, the cure of an old ulcer; and if there are any symptoms of congestion in the head, a seton should be inserted in the back of the neck.

For the treatment of *Sloughing Ulcers*, we must refer to the article SYPHILIS.

ULEABORG, a seaport town of Russian Finland, capital of the government of the same name, stands on the south bank of the Ulea, on the eastern shore and near the head of the Gulf of Bothnia. It was founded in 1605, and the privileges of a port were granted to it in 1715. In 1822, it suffered severely from fire. The harbour has of late years become so shallow, that vessels are obliged to unload in the roadstead, four miles from the town. Pop. about 8000, who are engaged in the dockyards, sawmills, and breweries of the town. In 1854, an English flotilla burnt the government property in the place.

ULE'MA, the collective name of a certain class of theological jurists in Turkey, who, as is the case in Mohammedan countries, derive their decisions from the Koran and its commentaries. The Ulema enjoys many privileges; he pays no taxes, cannot be condemned to death or deprived of his property by any court of law. He can only—eventually—be deposed and banished. The ulemas

have to recognise, save their two immediate superiors (the *kadiasks* or *kadilesks*), only the mufti as their chief authority, whilst they are the superiors of all the Mollahs (q. v.) in the different provinces. The kadis form the lowest judicial class, and are subject to the mollahs in every respect.

U'LEX. See FURZE.

ULFILAS (*Ulphilas*, *Wulfilas* = little wolf), the celebrated translator of the Bible into Gothic, was born about 318 A.D., of Marcomannian parents, north of the Danube, among a Gothic population. Consecrated bishop in 348, he was expelled by his heathen compatriots from his native place, and sought refuge, together with a number of newly-converted Christians, in Lower Mœsia, at the foot of the Hæmus, where he remained for thirty years. In 388, he went to Constantinople (whither he had gone once before to assist at a council, in 360), and died there shortly afterwards. He was one of the chief lights of Arianism (see ARIUS), in the interest of which he exerted himself with the utmost energy. Nor was his political influence less felt among his Gothic countrymen; and the contemporaneous Greek historians, no less than those that followed within a short time after his death, are unanimous in attributing to him the largest share in the religious and social development of the Gothic population. His greatest work, however—one which will render his name famous for all ages—is his Gothic translation of the Bible, a work by which he contrived both to fix the Gothic language and to perpetuate Christianity among the Gothic people. Familiar with Latin, Greek, and Gothic, and accustomed to write in each of them, he undertook to render the whole Bible, with the exception of the two warlike books of Samuel and Kings—the influence of which he feared for his easily inflammable people—into a language which till then had, as far as we know, never been used for any literary composition of importance. Up to the 9th c., this sacred and national work accompanied the Goths in all their migrations. But from that period forth, nothing was known of it beyond what was found stated in the ancient ecclesiastical accounts. It was not till the end of the 16th c. that Arnold Mercator discovered in the Abbey of Werden the four Gospels of Ulfilas. Thence it found its way to Prague, where it remained till 1648, when the Swedes took it as a spoil to Upsal, where it still remains in the University Library, under the name of the *Codex Argenteus*. In 1818, further remnants of the work—a great portion of the Letters of St Paul—were discovered by A. Mai and Castiglioni, on palimpsests, in a Lombardian monastery, which, added to a few minor fragments, bring the New Testament somewhat near completion. But hardly anything—save a few passages from Ezra and Nehemiah—has survived of the Old Testament. The immense importance of this sole Gothic remnant for Teutonic philology cannot well be overrated. It is principally through it that the wonderfully fine structure of Gothic—a Germanic dialect of surpassing wealth and purity—has become known.

U'LLSWATER, after Windermere, the largest of the English 'Lakes,' lies between the counties of Cumberland and Westmoreland, 10 miles east of Keswick. Length, 9 miles; breadth, 1 mile. Its scenery has none of the soft beauty of that of Windermere, but is rugged and grand. One of the chief features of the landscape is the lofty mountain Helvellyn, which rises from the south-west extremity of the lake.

ULM, the second city of Würtemburg, in 49° 54′ N. lat., and 8° 8′ E. long., was, till the war in 1866, a stronghold of the Germanic Confederation, garrisoned by troops of Würtemberg, Austria, and Bavaria. It is situated at the junction of the Blau with the Danube, which then becomes navigable, 53 miles west of Augsburg by railway. A beautiful bridge, built in 1832, unites the city to New Ulm, a village on the Bavarian side of the river. The streets are narrow, and the buildings old. Pop. (1867) 24,739; (1880) 32,773. The environs are flat; but a league to the north, softly undulating heights begin.

The cathedral is remarkable for architectural beauty, and is the largest church in Germany. It is 485 feet in length, 200 in breadth, and 141 in height, the unfinished tower over the main entrance being 337 feet. The building was begun in 1377, and finished in 1494. There are good schools for the people, a gymnasium, high school, and trades' school, a public library, an agricultural society, and many charitable institutions. Leading industries are weaving linen, cotton, woollen, and mixed fabrics; bleaching; making paper, leather; beer-brewing; ship-building; book-printing, &c. U. is famed for ornamental pipe-bowls, and pastry called Ulmer bread. Around the city, gardening is extensively carried on, and asparagus especially cultivated.

The Romans had a settlement at this important point. In 1531, the city accepted the Reformation, and the majority of the people have since been Lutherans. In 1802, U. was attached to Bavaria, and became part of Würtemberg in 1810.

ULMA'CEÆ, a natural order of exogenous plants, regarded by some botanists as a sub-order of *Urticaceæ*. They are trees or shrubs, having rough alternate leaves, each leaf with a pair of deciduous stipules. The flowers are small and in loose clusters. The perianth is small, membranous, bell-shaped, irregular; the stamens equal in number to the lobes of the perianth, and inserted into their base; the ovary superior. The fruit is 1—2-celled, nut-like, or compressed and winged. There are about 60 known species, natives of temperate parts of the northern hemisphere. See ELM, NETTLE-TREE, and ZELKOUA.

U'LMIN. See HUMUS.

U'LNA. See ARM.

ULODE'NDRON, a singular genus of coal plants, founded on stems which occur chiefly in the roof-shales. The stems are covered with small rhomboidal scars, as in Lepidodendron, formed by the bases of leaves or scales; but they differ remarkably from that genus in having a double series of large oval or circular markings, arranged linearly on the opposite sides of the trunk. These markings are variously interpreted as representing the cicatrices produced by the bases of cones, by branches, or by leaf-stalks. It is, like many of the coal fossils, an extremely enigmatical plant; and it is difficult to determine its position in the vegetable kingdom. It is probably an ally of Lepidodendron, and that is known to be a vascular cryptogam nearly related to Lycopodium. Seven species are known.

ULPIA'NUS, DOMITIUS, a celebrated Roman jurist, of Tyrian extraction, flourished in the early part of the 3d century. The exact date of his birth, however, is unknown. He appears to have held juridical offices during the reigns of Septimius Severus and Caracalla, of which he was deprived by Elagabalus; but, on the accession of Alexander Severus (222 A. D.), he became the principal adviser of that emperor, who appointed him *scriniorum magister* (keeper of the public records), a *consiliarius* (public assessor), and *præfectus annonæ* (superintendent of the corn-market). He also held, during

he reign of Alexander Severus, the important post of prefect of the Prætorian Guards, though it is uncertain whether that monarch first conferred it upon him. He was murdered by his own soldiery, 228 A.D. U. was both a voluminous and a valuable writer. In the *Digest* of Justinian, there are no fewer than 2462 excerpts from him, many of which are of considerable length. Altogether, they form about a third of the whole body of the *Digest*. Unfortunately, the originals have almost entirely perished. The principal were—*Ad Edictum* (83 books), *Ad Sabinum* (51 books), *Ad Leges Juliam et Papiam* (20 books). The so-called *Fragmenta* of U. (first published at Paris by Tilius in 1549) consist of 29 titles, whence they are called in the Vatican MS. *Tituli ex Corpore Ulpiani*. The best edition is Böcking's (Bonn, 1836).

ULRIC, St, Bishop of Augsburg, and venerated as one of the Fathers of the German Church, was born at Augsburg about the year 890. His father, Hupald, was one of those counts of Dillingen who play so important a part in medieval German history, and U. himself owed part at least of the extraordinary influence which he exercised in his time, to the distinguished rank of his family. He was educated in the celebrated Benedictine monastery of St Gall (q. v.) in Switzerland; but his later life, and the character of his mind, as well as the tendency of his religious views, appear to have been influenced less by his monastic instructors, than by the counsels of a remarkable female recluse named Wiborada, whose cell was in the vicinity of St Gall, and with whom he formed a close association. It was by her counsel that, instead of adopting the Benedictine habit at St Gall, he devoted himself to the secular ministry, and returned to his native diocese of Augsburg, where he received holy orders. In accordance with the usage of his time, he made a pilgrimage to Rome, and soon after his return, was consecrated Bishop of Augsburg, on the death of Hiltine in the year 923. The details of his history as administrator of this church, which had suffered serious disorganisation through the Magyar invasion and other wars, would be out of place here; but they are related with much circumstantiality by his contemporary biographer; and they throw so much light as well on the externals of the religious life of the time, as on the moral and spiritual character of the people, laity as well as clergy, as to merit the most serious consideration of every student of medieval history. Bishop U. bore an important part in the public affairs of the empire during the reign of Henry I. and his son Otho; and he was the guiding spirit of the several councils in Germany which, in the 10th c., laboured at the work of reformation. He died in 973.—See the ancient *Vita S. Oudalrici Episcopi*, which is edited by Mabillon, by the Bollandists, and recently by Dr Pertz. Some letters and sermons, still extant, have been ascribed to U., but they are regarded as spurious by Mabillon and Pertz, as well as by the Bollandists.—See Braun's *Geschichte der Bischöfe von Augsburg*.

ULRICI, Hermann, a German critic, born at Pförten in Lower Lusatia, 23d March 1806, studied at Halle and Berlin, and after a brief career as a lawyer, devoted himself exclusively to literature and philosophy. In 1834, he was appointed a professor-extraordinary at Halle, a position which he continues to hold. His first work was his *Geschichte der Hellenischen Dichtkunst* (2 vols., Berl. 1835), which was followed by a very clever and ingeniously theoretical production on the dramatic art of Shakspeare (*Ueber Shakspeare's dramatische Kunst*, Halle, 1839; Eng. transl., Lond. 1846), which has, however, attracted more attention than it probably merits. Other works of U.'s are his *Ueber Princip und Methode der Hegel'schen Philosophie* (Halle, 1841); *Das Grundprincip der Philosophie* (2 vols., Leip. 1845—1846); and a *System der Logik* (Leip. 1852). As a further fruit of his Shakspearian studies may be mentioned his edition of *Romeo and Juliet* (Leip. 1853). In 1862 he published *Gott und die Natur*.

U'LSTER (Lat. *Ultonia*), a province of Ireland, the most northern of the four into which that kingdom is divided. See Ireland. It is divided into nine counties, Antrim, Armagh, Cavan, Donegal, Down, Fermanagh, Londonderry, Monaghan, and Tyrone, each of which is described under its proper head.

The territorial distribution by which U. is constituted a province, or at least a distinct territory, is of very ancient origin. It formed one of the five ancient divisions of Ireland, and was the seat of the Hy-Nialls or O'Neills, as well as of the less distinguished septs of O'Donnell, O'Cahan, O'Doherty, Maguire, MacMahon, &c. The north-eastern portion, the present county of Down, was, early after the invasion, overrun by the English under De Courcy, and was subsequently held by Hugh de Lacy. This was the most permanent seat of English power in Ireland during the early period. The coast of Antrim was occupied by a colony of kindred Celtic race from Scotland and the Isles; but although various efforts were made by the English to effect a permanent settlement in the north and north-west, their success was little more than nominal until the reigns of Elizabeth and James I., when the well known Plantation of U. was attempted. Of this gigantic scheme of enforced colonisation, the chief seat was the county of Londonderry (q. v.). In U., the Celtic race, owing to the frequent and large infusions of a foreign element from England and Scotland, is found in a much smaller proportion. In 1861, the Roman Catholics were slightly in excess of the total of all other denominations, but these proportions, owing to ten years' emigration, are reversed in 1871. Of the total population of 1,830,398 in the latter year, the Protestants of all denominations made up 935,923, the Roman Catholics only 894,525. Of the former, 484,425 were Presbyterians, and 398,705 Episcopalians. Pop. in 1881, 1,743,075.

ULSTER BADGE. On the institution of the order of Baronets in England by James I., a sinister hand, erect, open, and couped at the wrist gules, the armorial ensign of the province of Ulster, was made their distinguishing badge, in respect of the order having been intended for the encouragement of plantations in the province of Ulster. This badge is sometimes borne in a canton, sometimes on an escutcheon, the latter placed either in the fess point or in the middle chief point, so as to interfere as little as possible with the charges of the shield.

ULSTER KING-OF-ARMS, the king-of-arms or chief heraldic officer of Ireland. A king-of-arms called Ireland existed in the time of Richard II., but the office seems to have fallen into abeyance in the following century. Ulster was created to supply his place by letters-patent of Edward VI. in 1552. Ulster holds his appointment from the crown, and acts under the immediate direction of the Lord-lieutenant of Ireland. His office is in the Record Tower of Dublin Castle; and the professional staff under him consists of two heralds, four pursuivants, one registrar, and one clerk of records. The records of Ulster's office comprise pedigrees of the nobility and gentry of Ireland, certificates of their deaths and funerals, and grants of arms. The official arms of Ulster King-of-arms are: Argent, St George's

cross gules, on a chief of the last a lion passant gardant between a harp and a portcullis or.

ULTIMA'TUM, in Diplomacy, the final conditions or terms offered by one government for the settlement of its disputes with another: the most favourable terms which a negotiator is prepared to offer, whose rejection will generally be considered to put an end to negotiation.

U'LTIMUS HÆ'RES, in the Law of Scotland, means the crown, which is the last heir after all the kin have become exhausted, and succeeds to the property of those who die without leaving next of kin, or who, being bastards, have no next of kin.

ULTRAMARI'NE, a beautiful blue pigment, formerly obtained only from the very valuable mineral, lapis-lazuli; but an artificial kind is now made so cheaply, and is so good, that it is generally used instead. The true ultramarine, from its costly nature, was only used by artists; the artificial sort is, however, extensively used by house and ship painters, and is as cheap as it is beautiful. Many artists still insist upon having the former kind, which is prepared as follows: Fine lapis-lazuli is broken up into very small pieces, so as to enable the operator to see and pick out the small white portions which occur in it. Of the pieces of pure blue which remain, a pound-weight is then taken, and in a carefully covered crucible, is heated to redness, and then thrown into cold water. It is next reduced to an impalpable powder, and mixed with six ounces of finely powdered resin, as light in colour as it can be obtained, and two ounces each of spirits of turpentine, bees-wax, and linseed oil, all previously melted together. When these ingredients are thoroughly worked into a mass, portions of it are taken and kneaded in clean water; as long as any blue colour is given out, this is continued, until every portion has been so treated. The blue water is then allowed to rest, and the sediment is collected and washed in water several times. The first washing removes a considerable quantity of dirt and other foreign matters, and is consequently rejected. The second, after being well agitated, is decanted; and from it is obtained the highest quality of the pigment. That which remains, usually has two other washings, each of which gives a product of a less value than the operation which preceded it. The product obtained by sediment from each of the waters used, is carefully dried, and is then employed either to make cakes for water-colour painting, or a mixture for oil-painting, the value being about £1 per ounce. ARTIFICIAL ULTRAMARINE.—The French chemists Clement and Desormes, in studying the curious process of obtaining ultramarine from lapis-lazuli by mixing it with resin, &c., were led to an analysis of the colouring matter that suggested to Guimet the idea of composing it artificially. In this he succeeded, and obtained for his discovery the prize of 6000 francs offered by the *Société d'Encouragement des Arts*. Almost simultaneously, Gmelin in Tübingen gave an analysis and a synthetic process which also succeeded, and artificial ultramarine is now a regular article of manufacture. Chemical skill, however, is necessary to success, and the manufacturers' formulas are very various —differing in the quantities of the ingredients, and the order of mixing them. The German manufacturers are very successful, and some of them have recently produced a fine green ultramarine. The following formula, which is recommended by Professor Miller, is one of the simplest: 100 parts of finely-washed kaolin or porcelain clay (silicate of alumina), 100 of carbonate of soda, 60 of sulphur, and 12 of charcoal, are mixed and exposed in a covered crucible to a bright heat for three hours and a half, when a green, unfused residue should be left. This residue, after being well washed and dried, must be mixed with a fifth of its weight of sulphur, and exposed in a thin layer to a gentle heat, so as just to burn off the sulphur. When this is accomplished, more sulphur must be added, and the washing repeated; and so on, until the mass acquires a light blue colour, which is usually the case after the third roasting. There is reason to believe, from the experiments of Wilkens, that ultramarine is composed of two portions—one of which is constant in its composition, and is the essential colouring matter, containing about 40 of silicic acid, 26 of alumina, 13 of sulphur, and 21 of soda, arranged as a mixture of two silicates of alumina, sulphite of soda, and sulphide of sodium—the blue colouring principle being a compound of the two latter; while the other portion differs from the former in resisting the action of hydrochloric acid, and contains a variable amount of sand, clay, oxide of iron, and sulphuric acid. Ultramarine, if heated in the air, gradually assumes a dull green tint; and it is quickly decomposed by the action of the mineral acids and chlorine.

The term *Yellow Ultramarine* is sometimes given commercially to chromate of baryta, a yellow insoluble powder used as a pigment.

ULTRAMO'NTANE (Lat. beyond the mountains—the Alps—namely, in relation to France), that party in the Church of Rome which assigns the greatest weight to the papal prerogative. The pope, according to the U. doctrine, is superior to general councils, and independent of their decrees; he is considered to be the source of all jurisdiction in the church; and it is through him, and not directly in virtue of their episcopal office, that the bishops derive their powers of 'jurisdiction,' as distinguished from those of 'order.' See ORDERS. The U. school has been the opponent of those doctrines and views which favour the right of self-government by national churches. The school opposed to the U. is called the Gallican. See GALLICAN CHURCH.

ULUGH-BEG, the grandson of Timûr (q. v.), governed Western Turkestan as regent for his father Shah Rokh, while the latter was employed in regulating the affairs of the southern half of the empire, and succeeded, in 1447, to the imperial throne on his father's death. He was a successful warrior, as was of necessity every ruler of this period; but happening, unfortunately, to conceive suspicions of the loyalty of his eldest son, suspicions founded only upon astrological indications, the offended and injured prince rebelled, defeated and captured his father, and soon after caused him to be put to death, thus fulfilling the prediction, 1449 A. D.

U. is known to posterity as the founder of the observatory at Samarkand, as the liberal patron of astronomers, and as himself a most diligent observer. The astronomical tables which bear his name, in all probability compiled by himself and his two fellow-labourers, Salah-ed-din Cadizadeh al Roumi and Gaiathed-din Mohammed Jerusheid al Coushgi, enjoy a high reputation for accuracy, considering the time when they were compiled, and the means of observation in the hands of astronomers. The astronomical works of U. were written in Arabic, afterwards translated into Persian, and thence the chronological portion of them rendered into Latin (Lond. 1650), by Greaves, who followed with a Latin version of the geographical part in 1652. An independent version of the same work in Latin and Persian was published by Dr Thomas Hyde, at

Oxford, in 1665. A new edition of U.'s catalogue of stars will be found in the *Memoirs of the Royal Astronomical Society*, vol. xiii.

ULULA'TION (Lat. howling). It sometimes happens that articulate sounds or cries resembling, perhaps imitative of those of animals, or mere shrieking and howling, form the sole or chief symptom and characteristic of a morbid mental state. The act is automatic, and may be regarded as indicative of grave changes in the physical and moral nature. In the middle ages, during great religious excitement, and those mental epidemics which involved large communities, such phenomena appear to have been of frequent occurrence. It appears that in the 18th c., a family of five sisters, in the county of Oxford, were affected with a modification of hysteria, during which they howled or barked like a dog; and that, about the same period, a large religious community of females in France, one and all, and at the same hours, shrieked or mewed like cats; and were only reduced to sobriety and to silence by the presence of military.—Laycock on *Nervous Diseases of Females*, p. 286; Calmeil, *De la Folie considérée sous le point de Vue Pathologique, Philosophique, Historique, et Judiciaire*, t. ii. p. 310.

U'LVA. See LAVER.

U'LVERSTON, a small but important market-town and seaport of Lancashire, in the district of Furness, 22 miles by railway north-west of Lancaster. It stands in an extensive agricultural and mining district, and is the centre of commerce for Furness, and for parts of Cumberland and Westmoreland. It contains cotton and paper mills, and carries on manufactures of linen, ropes, and woollen yarn, and has a coasting-trade in iron and copper ores, limestones, grain, and gunpowder. Pop. (1861) 6630; (1871) 7607; (1881) 10,001.

ULY'SSES, ULYXES, AND ULIXES, the Latin forms of the Greek ODYSSEUS, i.e., the 'Angry,' the name of one of the most celebrated heroes of the Trojan war. Different accounts are given of his parentage; but according to the oldest legend, the Homeric, he was the son of Laertes, Prince of Ithaca (one of the Ionian Isles), and of Anticleia, daughter of Autolycus. According to a later account, his father was the crafty Lisyphus; whence he is sometimes called, by way of reproach, Lisyphides. He married Penelope (q. v.), by whom he became the father of Telemachus. While still a youth, he had acquired a reputation for courage, eloquence, and address. When the expedition against Troy was resolved on, Agamemnon visited Ithaca, and prevailed on U., though with difficulty, to take part in it. Later traditions, or, as in this case, perhaps we ought to call them *inventions*, go on to exaggerate the reluctance of U. to leave his home, and represent him as feigning madness—an artifice which did not, however, succeed. Before hostilities broke out, U., in conjunction with Menelaus and Palamedes, was sent to Troy, with the view of persuading the Trojans to give up Helen and her treasures; but this little bit of diplomacy having failed, the Greek princes assembled their fleets in the port of Aulis, and sailed for Troy, U. bringing with him twelve ships. During the siege, U. performed important services for the Greeks. In prudence, ingenuity of resource, and *finesse*, he was the foremost of the Hellenic chiefs, while in courage he was inferior to none. After the fall of Troy, the most interesting part of U.'s career begins, and forms the subject of the Homeric poem called the *Odyssey*. Several of his adventures are manifestly of eastern origin, and closely resemble those of *Sinbad the Sailor*. Setting sail for home, his ships were driven by a storm on the coast of Thrace, where he plundered the town of Ismarus, but lost a number of his crew. Having re-embarked, a north wind blew them across the Ægean and the Levant, to the country of the Lotophagi (the 'Lotus-eaters'), on the coasts of Libya, where the companions of U. ate of the wondrous fruit, and wished to rest for ever. (Our readers will remember Tennyson's delicious rendering of this episode.) But their leader compelled them to leave the land 'in which it alway seemeth afternoon;' and sailing north again, they touched at the 'island of goats,' where U. left all his ships but one. Thence he proceeded westward, till he reached the 'island of the Cyclopes' (Sicily), where occurred the incident narrated under POLYPHEMUS (q. v.). The island of Æolus, and the city of the Læstrygones (a race of cannibals), whither fortune and the winds next carried the Hellenic chief, are supposed to be only names for particular parts of Sicily. Thence he sailed westward to the island of Ææa, inhabited by the sorceress Circe (q. v.). After a year's sojourn, he departed, and sailing still further west, crossed Oceanus, the 'ocean-stream,' into the country of the Cimmerians (q. v.), where darkness reigns perpetually. Here (following the advice of Circe) he descended into Hades (q. v.), and inquired at the blind seer Teiresias how he might get back to his native land. Teiresias disclosed to U. the fact of the implacable enmity of Poseidon (Neptune), on account of his having rendered Polyphemus (who was a son of Poseidon by the nymph Thoosa) blind, but encouraged him at the same time with the assurance that he would yet reach Ithaca in safety, if he would not meddle with the herds of Helios (the sun-god) in Thrinacia. U. now retraced his course, and once more visited Circe, the kindly sorceress, who forewarned him of the dangers he would yet have to encounter, and how to act. A west wind blew them past the perilous island of the Sirens (q. v.) to the coasts of Italy. In passing between Scylla and Charybdis, the monster that inhabited the first of these rocks devoured six of U.'s companions. He next came to Thrinacia, which he would fain have passed by, but his crew insisted on landing, and in spite of their oath, killed some of the cattle of Helios while U. was asleep. The anger of Zeus was kindled. When they had sailed away, a fierce storm arose, and Zeus sent forth a flash of lightning that destroyed the ship. Every one on board was drowned except U. himself, who, after many dangers, reached the island of Ogygia, the abode of the nymph Calypso, with whom he lived for eight years. After his departure (which was commanded by Zeus, who had promised to Athene that U. should one day see Ithaca again—the poet always represents him as having a longing after his native isle), Poseidon persecuted him with a storm, and cast him on the shores of Scheria, the island of the Phæacians, in a very forlorn and indescribable condition. He was, however, very kindly received by Nausicaa, daughter of King Alcinous; and having revealed his name at a feast, the monarch provided him with a ship to carry him home. U. was asleep when the vessel approached the coast of Ithaca; and the Phæacian sailors who had accompanied him bore the unconscious hero to the shore, and left him there. When he awoke, he did not at first recognise where he was; but Athene appearing, informed him, and of all that had happened to Penelope (q. v.) in his absence. Disguised as a beggar, he repaired to his own court, where he was recognised by his nurse, and, as Homer touchingly describes, by his old dog, Argus. Aided by Telemachus, and the swine-herd Cumæus, he took vengeance upon the insolent suitors of his wife, all of whom

without exception, he slew. Homer records nothing more of U.'s history; but he makes Teiresias prophesy, in the 11th book, that the hero would meet a painless death in a happy old age. Another tradition says that he was slain by Telegonus, his son by Circe. Later poets, e. g., Virgil and Ovid, represent U. as a much less noble and valiant character than he appears in Homer; his wisdom and subtlety are changed into cunning and deceit; and instead of heroic courage, he displays the spirit of a coward.

UM is a Kaffir or Zulu word signifying river, and is used as prefix in the names of most of the rivers on the south-east coast of Africa, from the Great Kei, where the names of Hottentot origin appear to cease, as far to the north-east nearly as the Sofala coast, where the names Imhambane, Imhampoora, have the same prefix in a corrupted shape. Amongst the principal rivers on this coast bearing this prefix may be mentioned the Umgazi, Umbashee, Umtata, Umzimvoobo, and Umzimculu, draining Independent Kaffraria; the Umcomanzi and Umtugela, in the colony of Natal; and the Umfolusi, Umhlatoozi, and Umapoota, between Natal and Delagoa Bay. The Hottentot word Kei has the same meaning, and is still preserved in the Kei and Keiskamma rivers, the Keriega, Keisuga, and other streams on the east coast of the Cape Colony.

UMÂ is, in the epic and Purânic mythology of India (see *Religion*, under INDIA), one of the principal names of the consort of the god S'iva. Other names by which she is also usually designated are *Durgâ*, *Devî*, *Kâlî*, *Pârvatî*, *Bhavânî*, while there are many more belonging to her which are of less frequent occurrence, as *Kâtyâyanî*, *Ambikâ*, *Haimavatî*, *S'ivâ*, &c. As S'iva is not yet a deity of the Vedic period of India, such of these names as are met with in Vedic writings have there a different import from that assigned to them by the later mythology. Thus, *Ambikâ* is, in the Yajurveda, a sister of *Rudra* (q. v.); *Kâlî*, a word which occurs in the Mun'd'aka Upanishad (q. v.), is there the name of one of the seven flickering tongues of Agni, the god of fire; *Durgâ*, in a hymn of the Taittirîya Âran'yaka, is an epithet of the sacrificial flame; and *Umâ*, when mentioned in one recension of the same Âran'yaka (see VEDA and UPANISHAD), and in the Kena Upanishad, means the Brahma-science, or the knowledge of what is the nature of Brahman, the Supreme Soul; and in this sense she is identified in the Taittirîya Âran'yaka with Ambikâ. But since Rudra is in later mythology a name of *S'iva*, and the Vedic Rudra is a form of Agni, the fire, more especially of the fire of the sun; and since Umâ, in the Kena Upanishad probably designates the power of Sûrya, the sun, it becomes intelligible that S'iva (q. v.), who, at a later period of Hindu religion, is both the type of destruction and contemplation, had then associated with him deities which originally represented the energy of the fire and the power or wisdom of the sun, and that those deities were afterwards held to be merely different forms or names of one and the same deity, viz., his female energy (see S'ÂKTAS), or wife. Though this double character of the consort of S'iva is not always discernible in the myths which are connected with special designations of hers, and though at a late period the popular creed looked upon her far more as the type of destruction than as that of divine wisdom, yet the works devoted to her praise never fail to extol her also as the personification of the highest knowledge. Thus, in the *Devîmâhâtmya*, the Rishi Mârkan'd'eya, in reply to a question of King Suratha, says: 'By Devî, this whole universe, with what is movable and immovable, has been created, and, when propitious, she who bestows blessings leads men to their eternal bliss; for she, the eternal goddess, is the highest wisdom, the cause of eternal bliss, and also the cause of bondage for this world, she who lords over the Lord of the universe.' And in another passage of the same work, she is invoked thus: 'O Devî, thou art the seed of the universe, the highest Mâyâ (q. v.); all this world is bewildered, but, descending on earth, thou art the cause of its final liberation: all the sciences are merely different modes of thyself.' Similarly, also, in the *Mahâbhârata* (q. v.), Arjuna says to her: 'Of sciences thou art the Brahma-science,' &c.; and in the *Harivans'a*, Vishn'u addresses her as Saraswatî, the goddess of eloquence, as Smriti, tradition, and, of sciences, as the Brahma-science, &c.

The myths relating to this goddess, who is worshipped in various parts of India—particularly, however, in Bengal (see S'ÂKTAS)—are met with in the great epic poems and Purân'as, in poetical works, such as the *Kumârasambhava* (see KÂLIDÂSA), and in modern popular compositions; but the text-book of her worshippers is the *Devîmâhâtmya*, or 'the majesty of Devî'—a celebrated portion of the *Mârkan'd'eya Purân'a*, and considered to be of especial holiness by the worshippers of this goddess. In the *Râmâyan'a* (q. v.), she is spoken of as the daughter of Mount Himâlaya (her names *Pârvatî*, *Haimavatî*, *Adrijâ*, *Girijâ*, and similar ones, mean 'the mountainous or the mountain-born'), and of the nymph Menâ, whose elder daughter, however, was the Ganges. According to the Vishn'u- and other Purân'as, she was in a former life *Satî*, the daughter of Daksha, who abandoned her corporeal existence in consequence of having been slighted by her father when he performed a great sacrifice, and did not invite S'iva to share in it; but it was only as Umâ that she bore children to her husband, viz., *Ganes'a*, the god of wisdom, and *Kârttikeya* (q. v.), the god of war. According to the *Harivans'a*, she was, in another life, born as the daughter of Yas'odâ, and exchanged for *Vishn'u*, when in his incarnation as *Kr'ishn'a*, he was born as a son of Devakî. See VISHN'U. On that occasion, she was killed by *Kansa* (q. v.); but as soon as he had dashed her to the ground, she rose to the sky, leaving behind her corporeal frame, and became a divine virgin, to whom the gods addressed their praises. Hence her names, *Kanyâ*, *Kumârî*, &c., the virgin. This connection between the legendary history of Umâ and Vishn'u is also briefly referred to in the *Devîmâhâtmya*, though this work is chiefly concerned in the narrative of the martial feats of the goddess. The latter consisted in the destruction by her of two demons, *Madhu* and *Kait'abha*, who had endangered the existence of the god Brahman; and of the demon *Mahisha*, or *Mahishâsura*, who, having conquered all the gods, had expelled them from heaven, and who met Devî, assisted only by her lion, with a numberless host of demons; moreover, in her defeating the army of *Chan'd'a* and *Mun'd'a*, two demon-servants of S'umbha and Nis'umbha; in her killing the demon *Raktavîja*, who had a sort of charmed life, each drop of his blood, when shed, producing hundreds of demons like himself; and ultimately, in her destroying the demons *S'umbha* and *Nis'umbha* themselves. In commemoration of her victory over Mahishâsura, a festival called the *Durgâpûjâ*, or *Durgotsava*, is annually celebrated in Bengal. 'The goddess,' the Rev. Mr Banerjea relates in his introduction to the *Mârkan'd'eya Purân'a*, 'is there represented with ten arms, trampling upon the demon, who is also attacked by her lion, and wounded in the chest by her spear. She has also laid hold of him by the hair, and is about to chop off his head. The most popular commemoration of

this event takes place in the autumn, about the time of the equinox; and if the practice may be supposed to be 800 or 1000 years old, it is not inconceivable that it was originally fixed at the equinox, though the precession has since made it a few days later. The calculation of the day depends, however, on a certain lunar day; but it can never be earlier than the seventh of As'win, which is about the time of our present equinox; nor can it be more than a month later than that date. The idea of the possible connection of the *Durgâpûjâ* with the equinox, is suggested by the fact, that there is a corresponding festival about the time of the vernal equinox too, in which, though it is not so popular as the autumnal *pûjâ*, the same group of figures is constructed, and the image of the goddess is in the same attitude, with the same attendance, and the same enemy.' (For a somewhat more detailed account of this festival, see Moor's *Hindu Pantheon*, p. 156.) Three weeks after the *Durgâpûjâ*, another festival in honour of this goddess, called the *Kâlîpûjâ*, takes place, to commemorate her victory over *Chan'd'a* and *Mun'd'a*. 'The sable goddess,' Mr Banerjea says, 'is represented

Kali (after the figure in Coleman's *Mythology of the Hindus*).

holding the severed head of Chan'd'a in her hand, with the heads of his soldiers formed into a garland suspended from her neck, and their hands wreathed into a covering round her loins—the only covering she has in the image constructed for the *pûjâ*. The worship of *Kâlî* (i. e., the Black), to which the narrative (of her victory over Chan'd'a and Mun'd'a) has given rise, is considered by the Hindus themselves as embodying the principle of *tamas*, or darkness. She is represented as delighting in the slaughter of her foes, though capable of kindlier feelings to her friends. She is, however, styled the Black Goddess of Terror, frequenting cemeteries, and presiding over terrible sprites, fond of bloody sacrifices; and her worship taking place in the darkest night of the month.' (For this worship, see also the article THUG.) With S'iva, she resides on Mount *Kailâsa*, the northern peak of the Himâlaya, or in her own palace on the Vindhya mountain, where she amuses herself with hunting. Her representations are numerous and various. Sometimes she is seen riding on a bull, with a trident in her hand, a serpent as bracelet, and a half-moon on her forehead; sometimes, when in the act of fighting Mahishâsura, she rides on her lion (*Manastâla*), the latter standing between the frontal bones of her elephant. Or, as *Bhadra-Kâlî*, she is represented 'eight-handed, two of her hands being empty, pointing upward and downward, one of her right hands holding something like a caduceus, its corresponding left hand, a cup; the next right and left hands, a crooked sword, and a shield with an embossed flower or fruit; the superior right hand, an agricultural implement; and the left, the noose to strangle victims with [see THUG]. Her person is richly dressed and ornamented; between her full breasts, a five-headed serpent uprears itself; she has a necklace of human heads; her ear-drops are elephants; and a row of snake-heads peeps over her coronet. Her forehead is marked either with S'iva's third eye, or her own symbol; and her open mouth shews her teeth and tusks, giving her a fierce and threatening aspect.' See Moor's *Hindu Pantheon*, where, besides, other descriptions of images of this goddess are given.—For the myths relating to her, see John Muir's excellent work, the *Original Sanskrit Texts*, vol. iv. (Lond. 1863); the *Harivans'a*, translated by A. Langlois (Paris, 1834—1835); and the *Mârkan'd'eya Purân'a*, in the *Bibliotheca Indica*, edited, with an elaborate Preface, by the Rev. K. M. Banerjea (Calcutta, 1862).

U'MBEL. See UMBELLIFERÆ.

UMBELLI'FERÆ (*Apiaceæ* of Lindley), a large and important natural order of exogenous plants, containing more than 1000 species, abounding chiefly in the temperate regions of the northern hemisphere. A peculiar regularity distinguishes the inflorescence of most of this order; a number of stalks, radiating from a common centre at the top of the stem, or of a branch, each of which bears a flower at its extremity, thus forming what is called an *umbel*. The umbel is often compound, the primary stalks dividing in a radiated manner, and forming *secondary umbels* or *umbellules*. The flowers are generally small, although the umbel which they compose is often large. They are generally white, rarely yellow, still more rarely red, though frequently tinged with pink at the edges; have a 5-toothed calyx, often obsolete, or nearly so; a corolla of five petals, inserted in the top of the calyx, and alternating with its teeth, five stamens, an inferior germen, and two styles. The fruit is very peculiar, and consists of two one-seeded, unopening carpels, rarely fleshy, touching one another on the inner side, and there attached to a little column (the *carpophore*), their common axis. Each carpel has five primary and four secondary longitudinal ridges, more or less

distinct; and beneath the separating furrows there are often linear receptacles of essential oil, called *vittæ.* The U. are mostly herbaceous plants, rarely shrubby. They generally have divided or compound, rarely simple leaves. They generally abound in a resinous secretion, and a volatile oil, from which many of them derive poisonous and medicinal properties, which are more or less common to all parts of the plant, and often highly developed in the seeds. Acridity is their general characteristic. Some are pleasantly aromatic, others have a powerful and disagreeable smell. In the roots of some, especially when enlarged by cultivation, starch and sugar are secreted, so that they become useful for food, although the peculiar flavour of the essential oil is still retained. The systematic arrangement of the U. has been found difficult by botanists. Sprengel, De Candolle, Koch, and others, have devoted much attention to this order. Of esculent-rooted U., the carrot and parsnip are the best known examples. Skirret, earth-nut, and arracacha are also of some value. The roots of *Anesorhiza Capensis* and *Fœniculum Capense* are used as esculents at the Cape of Good Hope. The roots of *Chærophyllum tuberosum*, or SHAM, are used in the Himalaya. The herbage of *Prangos pabularia* is so bland that it is much used in the temperate parts of the East Indies for feeding cattle, and made into hay for winter fodder. It is said, however, to be injurious to horses, although oxen and sheep are rapidly fattened by it. The blanched stems of celery, enlarged by cultivation, are a favourite salad, and those of Alexanders (*Smyrnium olusatrum*) were formerly used in the same way. The candied stalks of eryngo were once much esteemed, and those of angelica are still used. The leaves of parsley, chervil, fennel, &c., are used for flavouring. Lovage (*Levisticum officinale*) is sometimes cultivated as a salad plant. The seeds of anise, caraway, coriander, &c., are used as carminatives. Hemlock, water hemlock, water parsnip, fool's parsley, and many others, are narcotic poisons—asafœtida, galbanum, sagapenum, and opoponax are medicinal products of this order.

U'MBER (*Scopus umbretta*), an African bird of the family *Ardeidæ*, allied to the storks, but having a compressed bill with sharp ridge, the tip of the

Umber (*Scopus umbretta*).

upper mandible hooked, and the nostrils situated in a furrow which extends all the length of the bill. It is about the size of a crow, with umber-coloured plumage, and the male has a large crest on the back of the head.

UMBER, a mineral used as a pigment, a variety of the iron ore called Hæmatite (q. v.), and consisting chiefly of oxide of iron, with some oxide of manganese, silica, alumina, and water. It is soft and earthy, of a dark brown colour, and has a conchoidal fracture. It readily imbibes water, and falls to pieces like newly-burnt lime. It is found in Cyprus in beds. When roasted, it becomes reddish brown in colour, and in that state is also used as an artist's colour.

UMBI'LICAL CORD, or NAVEL STRING the bond of communication between the fœtus (which it enters at the umbilicus, or navel) and the placenta, which is attached to the inner surface of the maternal womb. It consists of the umbilical vein lying in the centre, and the two umbilical arteries winding from left to right round the vein. Contrary to the usual course, the vein conveys arterial blood to the fœtus, and the arteries return venous blood to the placenta. These vessels are embedded in a yellow gelatinous matter, known from its first describer (in 1659) as Wharton's gelatine. Nervous filaments have been traced into the cord; but the presence of lymphatics is doubtful. The whole is invested by a membrane (the amnion), and its ordinary length is about 20 inches. As soon as a child is born, and its respiration fairly established, the umbilical cord is tied, and divided near the navel, which spontaneously closes, the fragment of attached cord dying away. See the articles FŒTUS (in which there is a figure of the umbilical cord) and PLACENTA.

UMBILICAL CORD, in Botany, the connecting link between the placenta of the ovary and the ovule, through which pass the vessels which nourish the ovule till it ripens into the seed. In some plants, the ovules are so closely connected with the placenta, that no umbilical cord can be said to exist; in others, it is of considerable length.

UMBILICAL HERNIA is the term applied to the protrusion of intestine at the navel or umbilicus. It is, for obvious anatomical reasons, of most frequent occurrence shortly after birth; but it is not uncommon in women who have been frequently pregnant. If the hernia is reducible, and the patient an infant, the ordinary course of treatment is, after returning the parts to their proper position, to place the convex surface of an ivory hemisphere on the navel, and to retain it there either with strips of adhesive plaster, or with a bandage. Special trusses are made for the treatment of this affection in adults. In cases of irreducible hernia, a large hollow pad should be worn. If it becomes strangulated, an operation may become necessary.

UMBI'LICUS is the anatomical term for the navel.

UMBRE'LLA (Lat. *umbra*, a shade). As a shade from the sun, the umbrella is of great antiquity. In the sculptures of Egypt, Nineveh, and Persepolis, umbrellas are frequently figured, closely resembling the chaise umbrella of the present day. In the East, however, its use seems to have been confined to royalty; but in Greece and Rome it was more extensive. The custom was probably continued in Italy from ancient times; but at the beginning of the 17th c. the invention seems to have been little if at all known in England. In that century, however, it came into use as a luxurious sun-shade; and in the reign of Queen Anne it had become common in London as a screen from the rain, but only for the weaker sex. The first person of the male sex who had the moral courage to carry an umbrella in the streets of London was Jonas Hanway, the founder of the Magdalene Hospital, who was newly returned from Persia,

and in delicate health. Still, it was long regarded as a sign of infirmity or effeminacy to use them, and those who did so suffered much unpleasant jeering in consequence. They were at first all brought from abroad, chiefly from India, Spain, and France; now the manufacture of umbrellas has reached an enormous extent in Great Britain—the exports alone amounting to the value of £200,000; whilst, instead of effeminacy, it is considered now a sign of poverty or improvidence not to be possessed of one.

U′MBRIA, one of the ancient divisions of Italy, west of Etruria, and north of the country of the Sabines. It is usually described as extending from the Tiber eastward to the Adriatic; but while this was probably the case in pre-historic times, it was not so during any part of the period of which we have authentic knowledge. Tradition, indeed, leads us to believe that at one time the Umbrian territory extended from sea to sea, embracing much, if not the whole, of the country subsequently occupied by the Etruscans; but when the Umbrians first come before us as a distinct people, we find them restricted to the ridges of the Apennines, the lowland region bordering on the Adriatic from the Æsis (mod. *Esino*) to the Rubicon, being held by a race of Gallic invaders, known as the Senones. The most notable towns of U. were Narnia, Interamna, Acriculum, Spoletium, Mevania, Fulginium, Assisium Tifernum, Nuceria, Camerinum, Sentinum, Urbinum, Sena Gallica, Fanum Fortunæ, and Ariminum.

The Umbrians were considered in ancient times to be the oldest people of Italy, and were, in consequence, vaguely spoken of as 'aborigines;' but neither the knowledge of the ancients, nor the methods of investigation which they pursued, allowed them to arrive at any trustworthy ethnological results. Modern researches into their language (of which we possess one important memorial in the tables of Iguvium; see EUGUBINE TABLES) have demonstrated that they spoke a tongue closely allied to the Oscan (see OSCI), and were therefore, in all probability, members of the Latino-Italian race. These researches further tend to confirm the tradition of their great antiquity, for an analysis of the structure of the Umbrian language proves it to be the oldest of the Italian dialects.

The Umbrians make their first authentic appearance in the wars between the Romans and the Etruscans. They would seem to have been destitute of any political organisation or unity, for we find that some of their tribes took part with the Romans, and others—probably the majority—with the Etruscans. At anyrate, they were subjugated along with the latter people; and we do not read of them again until the third Samnite war, when, in conjunction with the Etruscans and Gauls, they joined the Samnites in their last gallant struggle against the imperious supremacy of Rome (q. v.). The confederacy was utterly vanquished in the great battle of Sentinum (295 B.C.), and the Umbrians were again reduced to submission. The establishment of Roman colonies in the *Gallicus Ager*, or territory of the Senonian Gauls, seems to have completely overawed, and gradually even to have Romanised them. They stood faithfully by Rome in the dark years of the Hannibalic war, and were among the first to furnish Scipio with volunteers for the invasion of Africa. In 90 B.C., they obtained the Roman franchise, and thenceforth disappear from history as a distinct people.

UMPIRE is a third arbitrator appointed by two arbitrators in the event of their differing in opinion; and when the reference or arbitration has devolved upon the umpire, his award or umpirage becomes final and binding on the parties.

UNALA′SHKA, an island belonging to the United States in the North Pacific, one of the Fox Islands, in lat. 55° 52′ N., and 166° 32′ W. It is 75 miles long, and in some parts 20 miles broad, has a rugged mountainous surface, and is thinly peopled. Ships are here supplied with all necessaries except wood.

UNCA′RIA. See GAMBIR.

U′NCIAL LETTERS—so called as being an inch (Lat. *uncia*) long—characters of a large and round form, used in some ancient MSS. The earliest form of an alphabet is its capitals, and the oldest Greek and Latin MSS. are written entirely in capitals. Uncial letters, which began to take the place of capitals in the middle of the 5th c., differ from them in being composed of rounded, and not straight lines, and exhibiting a tendency towards greater expedition in style. Uncial writing arose as writing on papyrus or vellum became common, the necessity for more rapid execution leading to the practice of curving the lines. Its being more easily learned than the cursive style, was probably the cause of its becoming the favourite mode of writing books of importance among the monkish scribes; while legal instruments, which required greater dispatch, were executed by professional scribes in a corrupted form of the Roman cursive hand. Uncial writing prevailed from the 6th to the 8th, or even 10th century. The following specimens of uncial Greek and Latin writing are from a MS. of the four Gospels and Acts of the Apostles in both languages, written early in the 6th c., and presented to the university of Cambridge by Theodore Beza in 1581. The passage is from John xxi. 19—'signifying by what death he should glorify God.'

Greek.

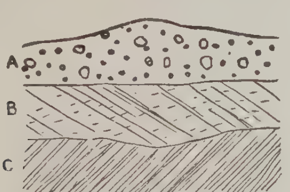
Latin.

During the 6th and 7th centuries, a transitional style of writing prevailed in Italy, and to some extent elsewhere, in which the letters approximated more nearly to the Roman cursive hand: this passed by a gradual transition into the *minuscule* manner, or small hand, which, from the beginning of the 10th c., became usual in MSS.—See Silvestre's *Universal Palæography*, translated and edited by Sir F. Madden (Lond. 1850); *Traité de Diplomatique*, par deux Religieux Benedictins de la Congrégation de St Maur (Par. 1755).

UNCLEA′NNESS, in the Old Testament, betokens a state of bodily infirmity which, for the time being, excluded the sufferer from the 'holy community,' and which, by the various ceremonies connected with the gradual recovery from this exceptional state, went far to impress the people with the constantly reiterated connection between them and God, and their own destination of being 'a holy people.' No less did the strict cleanliness enforced by the constant fear of becoming an 'outcast' for however brief a period, and the strict

supervision exercised by the priests, to whom the sanitary well-being was to a certain extent intrusted, act in a salutary manner. Birth, death, the different sexual functions and infirmities, were all, in different manner, causes of uncleanness, and treated according to their different degrees. To a certain extent, some incongruous admixtures of plants, animals, even materials in one garment, &c., may also be reckoned among things that 'defiled' or gave rise to a certain uncleanness. Fruits of a tree during its first three years were not to be eaten, as 'uncircumcised' or unclean. About the special ways in which uncleanness was treated, we have spoken under PURIFICATION, where also the similarity that has been found between the Jewish laws on these points and those of the Persians and Indians, is touched upon. The uncleanness of the leper is specially treated under LEPROSY.

UNCONFO'RMABLE STRATA are strata which rest on the more or less inclined edges of older beds. The existence of unconformability in a series of strata is an indication of an interval sufficiently long to permit of the consolidation, disturbance, and upheaval, denudation, and subsequent depression of the inferior beds. No indication of the period that has intervened is to be found in the unconformability itself; but some idea of it may be obtained by an examination of the strata that are known to have been deposited subsequent to the inferior rocks, and previous to the overlying unconformable deposits. Thus, in the north of Annandale, the Silurian basement rocks, which have often an almost perpendicular dip, are covered by Permian sandstone, and this, again, by the boulder-clay, or alluvial deposits. The first break in the strata represents the time during



Diagrammatic Section of Strata near Moffat:
A, Boulder clay, or alluvial deposits; B, Permian sandstone; C, Silurian rocks.

which the Devonian and Carboniferous rocks were deposited, when, in all probability, the Silurian strata formed a dry land surface, and supplied some of the materials for these rocks. The second break is all the indication in that district of the lengthened period during which the whole of the Secondary and Tertiary strata were being deposited elsewhere. The temporal value of the break is not so easily determined, in the majority of cases. It is only in one place in Britain, in a cutting in the St Helen's Railway near Ormskirk, where any apparent unconformability exists between the Bunter and Keuper strata, and even there it is so slight that it was long overlooked; yet this break represents a gap which on the continent is filled by the important sets of strata, the Muschelkalk and St Cassian beds, containing two great assemblages of fossils perfectly distinct from each other. Very frequently, however, no beds are known which fill up the gap between the two unconformable series. Professor Ramsay has shewn that in the Palæozoic epoch between the Laurentian gneiss and the Permian beds there are ten breaks. Each of these is accompanied by a sudden and remarkable change of fossils, sometimes in the genera, and always in the species. Professor Ramsay believes these gaps represent a *much greater* interval of time than that to which all the existing Palæozoic formations of Great Britain bear witness. Such blanks in the stony records of the world's history are as frequent in the Secondary and Tertiary epochs as in the Palæozoic.

The not taking into account the existence of unconformable stratification, has frequently caused a useless expenditure of money in searching for minerals. It seemed natural to expect that the Permian rocks of Upper Annandale covered beds of the true Coal-measures, but an examination of the numerous natural sections where the base of the Permian sandstone is seen, shews that it rests on the Silurian rocks; and the necessarily abortive attempts that have been made to reach coal through the Red Sandstone have been simply a useless throwing away of money.

UNCTION (Lat. *unctio*, an anointing, from *ungo*, I anoint), the practice of anointing the body, or certain portions of the body, with oil, especially with the oil of olives. It was resorted to by the ancients from motives of health (see OILS), of athletic development, or of luxury; but the practice is noticeable here chiefly in its relations to religion. Anointing with oil seems to have been supposed to carry with it the same effects in spiritual things which it produces in the natural world. It was a rite in frequent use among the Egyptians, as well as the Greeks and Romans; and the Scriptural narrative of the ante-Mosaic religion contains distinct evidence of its use (Gen. xxviii. 18, xxxi. 13). In the Mosaic ceremonial, its use is still more frequent. Priests and kings were anointed on being set apart for their several offices; as were also sacred vessels. The oil employed in these religious unctions was prepared of the most precious perfumes and balsams, and Ezekiel rebukes the Jews (xxiii. 41) for making a similar unguent for their personal uses. The special significance of the rite of unction may be inferred from the circumstance that the popular name of the expected Messiah was the Christos, i. e., the Anointed. In Christian use, anointing from a very early time possessed the same sacred significance. See EXTREME UNCTION. Besides the anointing of the sick, however, there are many other sacred unctions traceable in ancient Christian practice; namely, in baptism, in confirmation, in the ordination of priests and other clergy, in the consecration of churches and altars, the benediction of sacred vessels and utensils, &c. It has also been employed in the coronation of kings; and in some countries, curious traditions and legends are preserved connected with the unction of the king, or arising out of it. See RHEIMS.

UNDERGRA'DUATE, a student of a university or college who has not yet taken his first degree.

UNDI'NES (perhaps from *unda*, a wave), the name given in the fanciful system of the Paracelsists to the elementary spirits of the water. They are of the female sex. Among all the different orders of elementary spirits, they intermarry most readily with human beings, and the Undine who gives birth to a child under such a union, receives with her babe a human soul. But the man who takes an Undine to wife must be careful not to go on the water with her, or at least not to anger her while there, for in that case she will return to her original element. Should this happen, the Undine is not disposed to consider her marriage dissolved; she will rather seek to destroy her husband, should he venture on a second marriage. Baron de la Motte Fouqué has made this Paracelsist fancy the basis of an exquisite tale, entitled *Undine*.

UNDULATORY THEORY OF LIGHT. Optics ranks next to Dynamics in the category of nearly *exact* sciences—that is, of sciences whose fundamental principles are so well known, that the result of almost any new experimental combination can be predicted mathematically. Given the forces acting on a body, the Laws of Motion (q. v.) enable us, by purely mathematical processes, to determine the consequent motion. Though we have not as yet arrived at equal perfection in Optics, we are certainly far on the way, and probably have now attained nearly all the progress (independent of improvements in our mathematical methods) which will be made until the next great step in molecular physics shall give us the clue to the nature of the minute motions on which Light, Heat, Electric Currents, and Magnetism depend. The most extraordinary and almost incredible predictions of theory have been verified by experiment, and at present the differences between theory and experiment may be divided into two classes, corresponding to the above exceptions. The first are those depending on the imperfections of mathematical processes, where, because, for example, as we are yet unable to obtain the exact solution of a certain differential equation, we have to content ourselves with an approximate one. But every improvement in our means of approximation is found to introduce a closer agreement between theory and experiment. This difficulty may safely be left to mathematicians. It is otherwise with the second difficulty. This depends on our ignorance of the ultimate nature of matter, and our consequent inability to apply mathematical reasoning in a perfectly correct and sufficiently comprehensive manner. Here the experimenter's work is still required, and it is in this direction that we must in all probability now look for important extensions of our knowledge.

Optics is divided into two parts, *Physical* and *Geometrical*. Of these, the latter contents itself with assuming certain obvious experimental truths, such as the fact, that light in a uniform medium moves in straight lines, the ordinary laws of reflection and refraction, &c., and, making these its basis, employs mathematics to develop their further consequences. It is thus that theory has shewn how to carry to their utmost perfection such exquisite specimens of art as the best telescopes and microscopes of the present day. But these investigations, and their practical application, are wholly independent of the *nature* of light, and cannot be affected by discoveries in that direction.

It is otherwise when we come to Physical Optics. This commences with the question: '*What is light?*' and endeavours to deduce from the nature of light the experimental laws which, as we have seen, are assumed as the basis of Geometrical Optics.

By two perfectly distinct classes of astronomical observations—Aberration (q. v.), and the Eclipses of Jupiter's satellites—we know that light takes *time* to pass from one body to another—the velocity, however, being enormous—about 200,000 miles per second. Hence it follows, that either *Matter* (q. v.) or *Energy* (see FORCE) must be transferred from a body to the eye before we can see it. Here we have at once the rival physical theories of light, which have alternately had the advantage of one another in explaining observed phenomena. It is only of late years that an *experimentum crucis* has finally decided between them—by shewing one of them to be utterly incompatible with a result of observation.

Newton adopted the corpuscular theory, in which light is supposed to consist of material particles—i. e., he adopted the first of the two possible hypotheses; and he gave the first instance of the solution of a problem involving molecular forces, by deducing from this theory the laws of reflection and single refraction. We shall see immediately that this beautiful investigation led to the destruction of the theory from which it was deduced. But, independent of this, there are many grave and obvious objections to the corpuscular theory; for it involves essentially the supposition of material particles impinging on the eye with the astounding velocity of 200,000 miles per second! If such particles weighed but the millionth of a pound, each would have something like ten times the Momentum (q. v.), (i. e., the battering power), and *six million* times the Vis-viva (q. v.), or kinetic energy (i. e., the penetrating power), of a rifle-bullet. Suppose them a million times smaller—yet as millions of millions of them must be supposed to enter the eye at once, coming from every point of the surface of every visible object, it seems impossible to reconcile such a hypothesis with the excessive delicacy of the organs of vision.

It is not pretended by the advocates of the rival hypothesis, the Undulatory Theory of Light, that they understand exactly the nature of the transference of energy on which they suppose light to depend; but they take from the analogy of sound in air, and of waves in water, the idea of the existence in all space of a highly elastic fluid (or quasi-solid), provisionally named the *Ether* (q. v.), and they suppose light to consist in the propagation of waves in this fluid. Huyghens has the credit of having propounded, and ably developed and illustrated, this theory.

As we have seen above, no third hypothesis as to the nature of light is admissible. Many strong arguments against the truth of the corpuscular theory had been furnished by experiment, especially in the early part of the present century; and as they were always met by further and more extraordinary properties which had to be attributed to the luminous corpuscles, the theory had become complicated in the most fearful manner; and this of itself was an almost complete disproof. Still, it held its ground, for Newton's old objection to the rival theory, viz., that on the undulatory hypothesis there should be no shadows at all (witness the analogy of sounds heard round a corner), was as yet unanswered. This difficulty was overcome by Young (q. v.), to whose sagacity we are indebted for the idea of *Interference* (q. v.), which completely explained the apparent discrepancy. But the question between the rival theories was finally settled by Fizeau and Foucault, who, by processes entirely different, but agreeing in their results, determined the velocity of light in air and in water.

Now, Newton had shewn that refraction, such as that of light by water, if predicated of moving *particles*, requires that they should move faster in water than in air. Huyghens, again, had shewn, that if such refraction be predicated of *waves*, they must move slower in water than in air. Fizeau and Foucault found, by direct measurement, that light moves slower in water than in air. Hence it is certain that *light consists in the transference of energy, not of matter*; and the Undulatory Theory is based upon this fact.

But, as to the manner in which energy is thus transferred, we are entirely ignorant. The common assumption is, that waves of distortion are propagated in the ether. The nature of this motion will be described under WAVE. But many other modes have been suggested, one of the most notable of which is that of Rankine. Here the particles of ether are not supposed to be *displaced*, but each is merely made to turn about an axis as the wave of light passes it; the particles having Polarity (q. v.), by virtue of which they arrange themselves in similar positions when no light is passing, and by

which, also, any rotation of one particle produces a consequent rotation of those in its neighbourhood. For the explanation of most of the common phenomena of optics, it is quite indifferent which of these assumptions we make, and, indeed, theory has not yet been carried far enough to enable us to devise experimental methods of testing which is the more likely to be the case in nature. It cannot be too strongly insisted on that all we know at present is, that light certainly depends on the transference of energy from one part of the luminiferous medium to another; what kind of energy is transferred, vibratory or oscillatory motion, or rotation, &c., is a problem which may possibly for ever remain unsolved. But vibratory wave-motion being that with which we are most familiar, as in earthquakes, sound, waves in water, &c., we naturally choose this as the most easily intelligible basis of explanation and illustration. And we shall now briefly shew how the laws of linear propagation, reflection, single refraction, interference, diffraction, dispersion, polarisation, and double refraction may be accounted for.

We assume, then, that light consists in a succession of waves, and for our earlier inquiries it does not matter whether they be (like those of sound) waves of condensation and rarefaction, in which the vibrations take place *in* the direction of the ray, or (like those in water) waves of distortion or displacement without condensation, in which case the luminous vibrations must be assumed to take place in some direction *perpendicular* to the ray. The phenomena of polarisation and double refraction shew us that the former of these hypotheses is untenable.

Propagation of Light in a Uniform Isotropic Medium. (An isotropic medium is such that if a cubical portion be taken, it possesses precisely the same properties whatever be the directions of its sides. Glass and water are isotropic, rock salt and ice are not.)—Suppose AB (fig. 1) to represent at any time

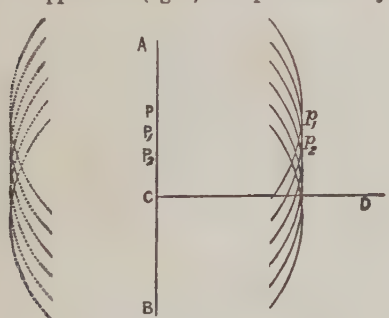


Fig. 1.

the *front* of a plane wave which is passing in the direction CD; i. e., suppose all particles of the ether in the plane AB (perpendicular to the plane of the paper) to be similarly and equally displaced. According to Huyghens, we must suppose every particle, P, to be itself the source of a wave, which, from the uniformity of the medium, will spread with the same velocity in all directions. With centre P, and radius the space which light passes over in any assigned interval t, describe a sphere represented in section by a circle in the figure. Do the same for adjacent points, P_1, P_2, &c. Let p_1 be the intersection of the circles whose centres are P and P_1, p_2 that of the circles whose centres are P_1 and P_2, and so on. Then, as p_1 is *equidistant* from P and P_1 and (approximately) from all points of a small circular space between P and P_1 on the wave-front AB, all the separate wave-disturbances coming from these points to p_1 will be in the same *phase* (see WAVE), and will therefore combine so as to strengthen each other; while in other directions they will be in different phases, and combine to destroy each other. The locus of all such points as p_1, p_2, &c., will therefore, at the end of the time t, contain all particles of the ether equally and similarly disturbed, and will thus be the new wave-front. But it is obviously a plane parallel to AB. Also the disturbance at P has passed to p_1; and, when the distance PP_1 is taken as very small, Pp_1 is perpendicular to the wave-front AB. Hence, in such a medium, a plane wave remains plane, and moves with uniform velocity in a direction perpendicular to its front. [There is a difficulty as to what becomes of the disturbance, which, according to Huyghens's assumption, ought to travel *back* into the dotted portions of the spheres; and it is not easy to account for the absence of this on mechanical principles. But we are content here to take for granted that no waves are propagated backwards from the main wave, as a fact clearly proved by experiment.] Since a small portion of the surface of any curved wave may be considered as plane, we now see how any such wave will be propagated in an isotropic medium. Erecting perpendiculars at every point of the surface of the curved wave, and laying off along these lines the space which light passes over in a given interval, the extremities form a new surface, which is the wave-front after the lapse of that interval.

Reflection at a Plane Surface.—Suppose AB (fig. 2) to be a plane wave-front, moving in the direction Bb

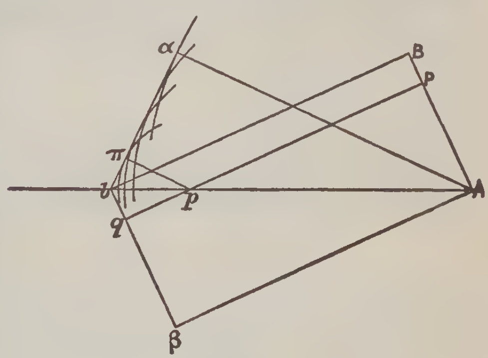

Fig. 2.

perpendicular to AB. Let Ab be the reflecting surface, and let the intersection of the plane of the wave-front with the reflecting surface be a line through A perpendicular to the paper. When B has arrived at b, A would have arrived at β, and P at q (where $b\beta$ is parallel to BA, and Pq and Aβ to Bb), had it not been for the reflecting surface. Hence, when B is at b, A has diverged into a sphere of radius Aβ P from p into a sphere of radius pq; and so for each point of the wave-front. Now, the spheres so described about A and p as centres obviously touch the plane $b\beta$; consequently, they touch the other plane $b\alpha$, which makes the angle A$b\alpha$ equal to A$b\beta$. Now, $b\pi\alpha$ is the front of the reflected wave, and Aα is the direction in which it is proceeding. Hence, obviously, the ordinary laws of Reflection. See CATOPTRICS.

Refraction at a Plane Surface into an Isotropic Medium.—Here we take account of the change of velocity which light suffers in passing from one medium to another. In fig. 3, A, P, B, b, p, q, and β represent the same as before—but suppose

$A\alpha$ now to represent the space through which the wave travels in the second medium, while it would travel from B to b in the first. With centre A, and

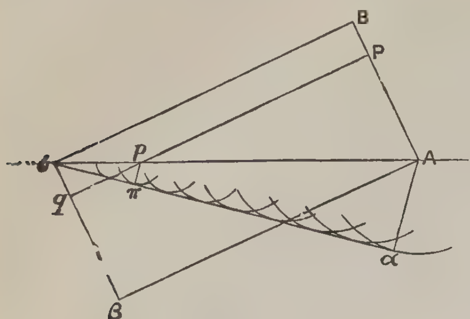

Fig. 3.

radius $A\alpha$, describe a sphere. Let $b\alpha$ touch this sphere in α. Then $b\alpha$ is the front of the refracted wave. For, if $p\pi$ be drawn perpendicular to $b\alpha$, we have

$$p\pi : A\alpha :: bp : bA :: pq : A\beta.$$

Hence, while A travels to α, and B to b, P travels to p, and thence to π. And the sines of the angles BAb and $Ab\alpha$, which are the angles of incidence and refraction, are to each other as Bb to $A\alpha$, i. e., as the velocity in the first medium is to that in the second. See DIOPTRICS.

It is obvious from the cut, that, the *less* is the velocity in the second medium, the more nearly does the refracted ray enter it at right angles to its surface. As a contrast, we may introduce here a sketch of Newton's admirable investigation of the same problem on the corpuscular hypothesis. Let AB (fig. 4) be the common surface of the two media,

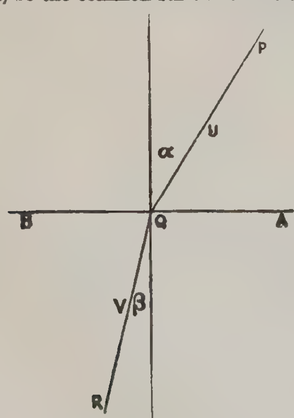

Fig. 4.

PQR the path of a corpuscle. Let U and V be the velocities in the two media, α and β the angles of incidence and refraction. Then the forces, which act on the corpuscle, being entirely perpendicular to the refracting surface, the velocity *parallel* to hat surface is not altered. This gives

$$U \sin. \alpha = V \sin. \beta.$$

Also the kinetic energy is increased by the loss of potential energy in passing from the one medium to the other. Hence the square of V exceeds that of U by a quantity which depends only on the nature of the two media and of the corpuscle. This shews that V is the same whatever be the direction of the ray, and then the first relation proves that the sines of the angles of incidence and reflection are *inversely* as the velocities in the two media; i. e., the refracted ray is more nearly perpendicular to the refracting surface the *greater* is the velocity in the second medium. It is very singular that two theories, so widely dissimilar, should each give the true *law* of refraction; and, in connection with what has just been said, it may be mentioned, that on the corpuscular theory a corpuscle passes from one point to another with the least *action*, while on the Undulatory Theory it passes in the least *time*. Hamilton's (q. v.) grand principle of *Varying Action* includes both of these.

Interference.—Fresnel's mode of exhibiting this phenomenon (whose discovery, as before said, is due to Young) is very simple and striking. An isosceles prism of glass, with an angle very nearly 180°, is placed, as in fig. 5, symmetrically in front of a brilliant point (the image of the sun formed by a lens of very short focus, for instance). The effect of the prism is that light which passes from O through the portion QR appears to have come from some

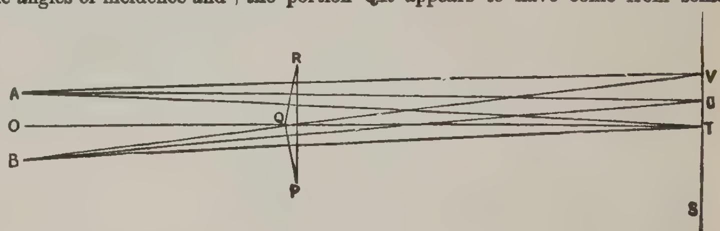

Fig. 5.

point such as A (the image of O as seen through the upper half of the prism). Similarly, the light which has passed through PQ appears to come from some point B. The light which has passed through the prism is to be received on a white screen ST. At the point T, which is in the prolongation of the line OQ, the distances TA and TB are equal; but for no other point, as U, in the line ST, are UA and UB equal. Suppose U and V to be such that UA and UB differ in length by half a wave-length of some particular colour, VA and VB by a whole wave-length of the same; then waves arriving at T, as if from A and B, have passed over equal spaces, and consequently their crests coincide, so that at T they reinforce each other. But at U, a hollow from A is met by a crest from B, so that darkness is the result. At V, again, crest and crest coincide. And so on. Hence, if we are experimenting with one definite colour of light, the effect on the screen is to produce at T, V, &c., bright bands of that colour, all parallel to the edges of the prism PQR. At points like U, there are dark bands. And the length of a wave can easily be calculated from this experiment; for the lengths of OQ and QT can be measured, and knowing the angles of the prism and its refractive index (see REFRACTION) for the particular colour employed, we can calculate the positions of A and B. We have then only to measure the distance TV between the centres of the two adjoining bright bars, and then geometry enables us to calculate the difference of the lengths of VA and VB, which, as we have seen, is the length of a wave. The results of this experiment shew how very minute

are these wave-lengths for visible rays. Thus, for

	Inch.
Extreme Red, the wave-length in air is	0·0000266
" Violet, " " "	0·0000167

These are, roughly, the $\frac{1}{40,000}$th and the $\frac{1}{60,000}$th of an inch. Seeing, then, that light describes 200,000 miles per second, the number of waves which enter the eye per second are—

Extreme Red, . .	460 millions of millions.
" Violet, . .	730 " "

These numbers, compared with those of sonorous waves (see SOUND) shew the extraordinary difference in delicacy between the optic and auditory nerves. But whereas the range of the ear is somewhere about 12 octaves, that of the eye is less than one.

Diffraction.—This has been already illustrated in a previous volume.

Dispersion.—We have just seen that, by Fresnel's interference experiment, waves of different lengths are separated (for in the last figure the position of the bright line, V, depends on the length of the waves which produce it). But the different colours are also separated by common refraction, as in Newton's celebrated experiment. See SPECTRUM. This shews, of course, that in refracting media, waves of different colours move with different velocities; and, as the violet are more refracted than the red, it appears that the shorter waves move more slowly in glass or water than the longer ones. In free space, waves of all lengths travel with equal speed, else (see ABERRATION) all stars ought to appear drawn out into spectra, in consequence of the earth's annual motion. Also, a star suddenly breaking out, or suddenly vanishing (a phenomenon several times observed), should flash out first red, and gradually become white, or should gradually decay from white to violet, which is not observed to be the case. These facts are the most difficult to explain of any to which the Undulatory Theory has yet been applied. Fresnel, indeed, appears to have been in possession of a solution of the difficulty, but the Appendix to one of his papers, to which he more than once refers as containing this explanation, was not found among his MSS. Cauchy and others have, however, by delicate investigations, shewn that, *if the forces exerted by the molecules of a refracting body on the ether are exerted through distances comparable with the length of a wave*, the velocity of light will then depend on the wave-length. The velocity is, in fact, shewn to be represented by a formula such as this:

$$A - \frac{B}{\lambda^2},$$

where A and B are constant quantities for a given medium, and λ is the length of a wave. The larger λ is, the less is the second term of the formula, and therefore the velocity is the greater. A very singular result follows from this formula—viz., that the velocity becomes more and more nearly equal to A as the wave-length is greater. Hence, waves of low radiant heat, which (see HEAT) are merely waves of light which are incapable of producing vision, must be crowded together towards a limit, not very far beyond the red end of the spectrum.

Polarisation.—We now come to a set of phenomena which give us some further information as to the nature of luminiferous waves. When two beams of light, such as those in Fresnel's experiment, are polarised in planes perpendicular to each other (see POLARISATION) before they meet, *they do not interfere.* This is in accordance with the assumption required for the explanation of the existence of polarisation itself—viz., that the vibrations of the either take place *transversely* to the direction of the ray.

Double Refraction.—Our assumptions, forced upon us by experimental results, are now so far complete that we may proceed, after Fresnel, to apply them to the explanation of double refraction. See POLARISATION; REFRACTION, DOUBLE. This explanation is extremely beautiful, and when published, was justly hailed as the greatest step in physical science which had been made since Newton deduced the facts of physical astronomy from the law of gravitation.

As we have seen above, in treating of simple reflection and refraction, that the form and velocity in and with which a disturbance spreads from any point of a wave, is all that is required for the determination of the course of a ray, we must endeavour to find the form in which a disturbance spreads in a double-refracting crystal, and this should lead us to a construction for each of the two rays.

Huyghens had already pointed out that one of the two rays produced by Iceland spar follows the ordinary law of refraction. Hence, the disturbances which give rise to this ray are propagated in spherical waves in the crystal. He shewed also that the other ray could be accounted for, if the disturbances to which it is due were propagated in the form of an oblate spheroid touching the sphere with the extremities of its axis, that axis being parallel to the crystallographic axis of the mineral. The following diagram (fig. 6) will make this clear: P is the

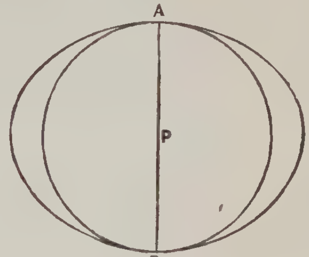

Fig. 6.

point where the ether is disturbed. Two waves spread from P in the form shewn in the cut, the line APB being the axis of rotation of the spheroid, and parallel to the axis of the crystal. Thus, let rays αA, &c. (fig. 7), of which AB is the wave-front, fall upon the surface Ab of such a crystal; and let AC be the direction of its axis. Draw, about A as

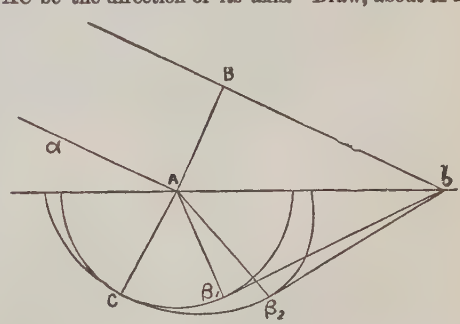

Fig. 7.

centre, the sphere and spheroid into which the disturbance at A spreads in the crystal while light in air passes from B to b. Then if planes be drawn through

the line b (perpendicular to the paper) so as to touch the sphere in β_1, and the spheroid in β_2, these planes will touch respectively all the intermediate spheres and spheroids produced by disturbances at points between A and b. [This is evident from simple geometry.] Thus, $b\beta_1$ and $b\beta_2$ are the new wave-fronts; and the ray aA, falling on the crystal, is divided into the two Aβ_1 and Aβ_2. Of these, Aβ_1 is the ordinary ray, and, being produced by spherical waves, has all the properties of a ray ordinarily refracted. It obviously moves perpendicularly to its front, as Aβ_1 is perpendicular to $\beta_1 b$.

But it is otherwise with Aβ_2, which is, in general, *not perpendicular to its front*, $\beta_2 b$. Again, if AC, the axis of the crystal, be not in the plane of incidence, the ray Aβ_2 is not in that plane; so that here we have *refraction out of the plane of incidence.*

The exact accordance of this construction with observation was proved by the careful experiments of Wollaston. We have only to add, that the two rays Aβ_1 and Aβ_2 are, in all cases, completely polarised in planes at right angles to each other.

The experiments of Brewster shewed that in by far the greater number of minerals and artificial crystals, *both* rays are extraordinary—i. e., neither of them can be accounted for by disturbances propagated spherically in the crystal. But no tentative process could lead to the form of the wave-surface in this most general case. Here Fresnel's genius supplied the necessary construction.

He assumes that the ether in a crystallised body is possessed of different rigidity, or different inertia, in different directions; a supposition in itself extremely probable, from the mechanical and other properties of crystals. In the general case, there are shewn to be three principal directions in a crystal, in any one of which, if the ether be displaced, the resulting elastic force is in the direction of the displacement. Each of these is, in all cases, perpendicular to the others. Any given displacement of the ether corresponds to partial calculable displacements parallel to each of these lines, and thus the elastic force consequent on any displacement whatever is known if we know those for the three rectangular directions. All the calculations are thus dependent on *three* numbers only, for each substance.

To find the form in which a disturbance will spread, Fresnel proceeds as follows. Let the plane of the paper represent the front of a wave in the crystal, and suppose a particle of ether to be displaced in it from A to B (fig. 8). This displacement may be resolved (by the law of the parallelogram of velocities, forces, &c.) into two components in any two directions in the plane of the paper. Assume

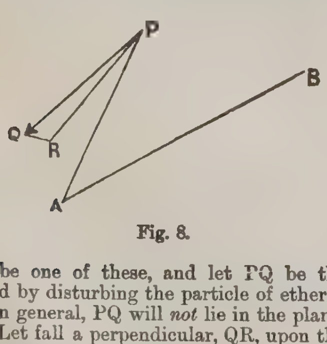

Fig. 8.

AP to be one of these, and let PQ be the force produced by disturbing the particle of ether from A to P. In general, PQ will *not* lie in the plane of the paper. Let fall a perpendicular, QR, upon the plane of the paper. In general, the point R will not lie in AP. The portion RQ, of the elastic force of the ether, Fresnel neglects, because it would produce vibrations perpendicular to the wave-front, i. e., *similar to those of sound*, and he assumes that such normal vibrations do not produce visible light. We shall recur to this point. Fresnel now assumes that the vibrations which will be propagated continuously in the crystal are such as have PR coincident in direction with AP; and then the rate of their propagation will depend upon the ratio of PR to PA. He shews by mathematical reasoning that there are *two* such directions in every wave-front, and that they are always *perpendicular* to each other. This, of course, at once accounts for double refraction, the complete polarisation of each of the two rays, and their being polarised in planes perpendicular to each other. The original plane wave is now broken into two, both parallel to the first, but in general moving at different rates. He next considers a disturbance at any point in a crystal as equivalent to waves having fronts in *every* plane passing through that point, and investigates mathematically the form of the surface which is touched by the planes of all the pairs of polarised rays which have (in any given time) proceeded from each of those wave-fronts. The form of this surface is very remarkable. It is symmetrical with reference to three planes at right angles to each other. These, of course together, cut it into eight parts, one of which is figured below (fig. 9). From this it appears, though Fresnel did not perceive it, that the surface has four *conical cusps*, as they are called, the inner

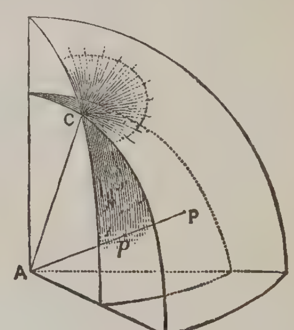

Fig. 9.

portion seeming to be drawn through a hole, as it were, and then spreading out again to form the outer portion. The external appearance of these points very much resembles the portion of an apple round the point of attachment of the stalk. Fresnel shewed that, in particular cases, when two of the three principal elasticities are equal, this surface degenerates into the sphere and spheroid of Huyghens, already described for Iceland spar; and that, when all three are equal, it becomes a single sphere, as in glass, water, and other singly refracting bodies. All this, of course, is in complete accord with experiment. But there is vastly more. If we use the wave-surface of Fresnel to construct the refracted rays, just as we employed the sphere for simple refraction, or the sphere and spheroid for Iceland spar, we find generally *two* definite refracted rays (both usually out of the plane of incidence) for one incident ray. But Hamilton (q. v.), who was the first to perceive the existence of the cusps already described, saw that they indicated the existence of a very remarkable phenomenon, to which he gave the name of Conical Refraction (q. v.). The ray which, in the crystal, passes from A to C (the cusp, see last figure), has not, like other rays such as ApP, two definite wave-fronts. For if at p and P, where the line ApP meets the inner and outer portions of the wave-surface, we draw tangent planes, these are the definite fronts of the corresponding

waves; so that such a ray will split into two only, on leaving the crystal. But AC intersects the surface at C, where it is *conical*, and has an *infinite* number of tangent planes, so that when it leaves the crystal it will split into an infinite number, forming a hollow cone. Hamilton's prediction then was: If a single ray of light be made to pass through a plate of a biaxal crystal in the direction AC (limiting it, for instance, by sheets of tinfoil with small holes in them properly fixed on each side), it will enter and emerge as a hollow cone. Also the plane of polarisation will differ for different rays in this cone. Lloyd completely verified this wonderful prediction by experiments made with a plate of *Arragonite* (q. v.). But more, Hamilton observed that (see last figure) the wave-surface can be touched by a tangent plane in a circle surrounding the cusp. If, then, we make the construction of fig. 7 with Fresnel's wave instead of the sphere and spheroid, there will be a definite direction of the incident ray αA, for which the tangent planes $b\beta_1$ and $b\beta_2$ in that figure will coincide, and will touch the wave-surface in the circle about the cusp. Any line drawn from A to a point in that circle will be a direction for a refracted ray. Hence the ray αA will be broken up into a hollow cone of rays, the vertex of the cone being A, and its base this circle. If the crystal be cut into a plate, each ray will of course emerge parallel to αA, and the *ensemble* of them will form a hollow cylinder. The prediction, then, is that a single definite ray, falling in a given direction on such a plate of crystal, will emerge as a hollow cylinder. This, and the predicted laws of the polarisation of the light of the cylinder, were also verified by Lloyd.

'The formulæ which led to such triumphantly successful predictions *may* have been deduced from incomplete or even erroneous premises; but they *represent a truth*, and must in time conduct us step by step back to ultimate proof of the truth of Fresnel's assumptions, and of the Undulatory Theory of Light as now understood, or shew us what modifications may be required in the original conceptions.'

It would unduly lengthen this article, and besides would lead us into discussions far too recondite for a work like this, to enter upon the question of whether the vibrations in polarised light are *perpendicular to* or *in* the plane of polarisation, a subject which has recently been well investigated by Stokes (q. v.); or to consider the production of elliptically polarised light by reflection at the surface of metals, diamond, &c.; and various other most important points of the theory. We can only mention that Green, Cauchy, Stokes, and others, who have entered deeply into the mechanical question of luminiferous vibrations, have found themselves obliged to take into account the *Normal* wave, which, as we have seen, Fresnel neglected.

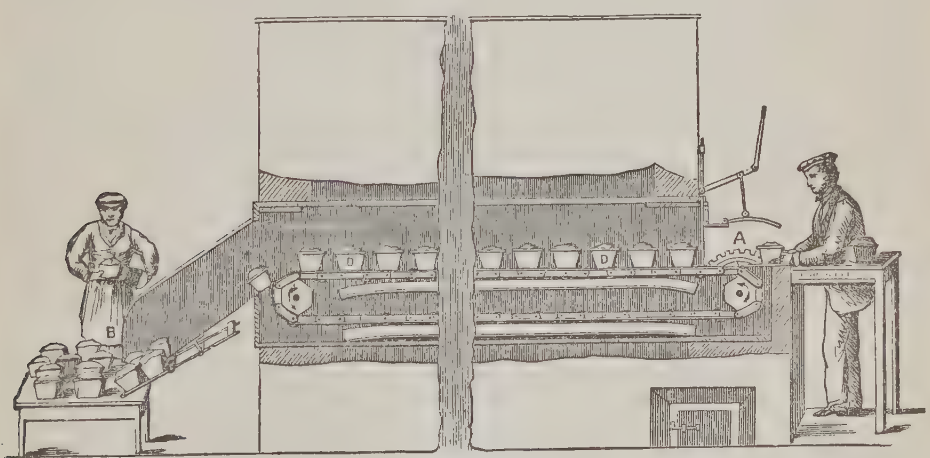
Fluorescence (see PHOSPHORESCENCE), Spectrum Analysis (see SPECTRUM), and various other important recent additions to the theory, must be merely mentioned; as also the very remarkable observation of Maxwell, which appears to connect Light and Electricity, and was derived from a theory which assumes the ether to be the vehicle of Electricity and Magnetism as well as of Light and Heat, and by which it appears that the velocity of Light is expressible in terms of the static and kinetic units of Electricity.

For further information, we refer the reader to Lloyd's *Wave-theory*, an excellent elementary treatise; while to the more advanced mathematician we may commend Airy's *Tract on the Undulatory Theory*, and Herschel's article 'Light' in the *Encyclopædia Metropolitana*.

Undy.

UNDY, in Heraldry, the same as Wavy. See HERALDRY.

UNFERMENTED BREAD. Under this heading we may briefly notice one or two improvements which have been introduced into the manufacture of AËRATED BREAD since the article on that subject was published in the first volume of this *Encyclopædia* in 1860, and the general bearings of this kind of baking, and of the bread thus produced, upon public health and upon the subject of medical dietetics. In 1862, the 'Aërated Bread Company (Limited)' was established for purchasing from the patentee, Dr Dauglish, the sole right of manufacturing this kind of bread in and around London; and from that time, the use of this new article of food has become much more extensive. Indeed, at the present day, Dauglish's Aërated Bread is manufactured not only in most of the



Dr Dauglish's Travelling Oven:

A, the mouth, and B, the tail of the oven; C, C, oven flues; D, D, the loaves in their tins moving onwards from the mouth of the oven to its tail; E, the door of one of the furnaces. (To save space, only the two ends of the oven are represented.)

large towns of England and of the United States, but also in Melbourne, Adelaide, and Sydney. In the working of the original patent, it was found that the pressure at the commencement of the process of driving the mixed ingredients from the iron box * through a cock or tap at the bottom was so violent as to give almost an explosive expansion to the ejected portion of dough, causing the structure of the bread more to resemble whipped cream or froth than fermented bread. This was a point of greater importance than might have been anticipated, because it is found by experience that the flavour and other palatable qualities depend in a great measure on the internal arrangement of the loaf. Moreover, a great part of the pressure obtained was entirely wasted. In the *Times*' city article of December 30, 1864, a new patent is described as having been taken out by Dr Dauglish, whose purposes are first, and chiefly, to improve the 'piled elastic texture' of aërated bread; and secondly, to provide mechanical means for dividing the dough into the requisite exact and uniform measured quantities for loaves, and for delivering each loaf into the tin in which it is to be baked. Dr Dauglish's last patent—his new mechanical or travelling oven—was only completed shortly before his death, which took place in the spring of 1866. In this oven, the loaves, after being placed on the movable bottom at the mouth, are carried with a regular intermittent motion, in an endless chain, which forms the movable bottom, through a chamber varying in length from 20 to 50 feet, to the end or tail of the oven. This chamber is heated by two or more furnaces, the flues of which are kept separate, each furnace heating its own portion. Small windows are inserted at intervals, by means of which the baking can be watched during its progress. The mouth of the oven is protected by two doors, which are lifted and shut alternately by an arrangement of apparatus worked by the same power which causes the endless chain constituting the movable bottom to traverse the length of the oven: the work of charging the oven goes on incessantly while the loaves are on their journey towards the tail of the oven; and the opening and shutting of the two oven doors is so arranged as to prevent the escape of the heat or steam from the interior of the oven. On the arrival of the loaves at the tail of the oven, the baking process is completed, and they are tipped off the revolving bottom, falling, by their own weight, on to a table placed ready to receive them. The mechanism at the tail of the oven is likewise so arranged as to prevent the escape of the heat or steam in the oven. By means of this travelling oven, the old and laborious plan of putting into and taking out of the oven each loaf separately with the peel (so injurious to the health of the journeyman baker) is henceforth abolished in the making of aërated bread.

Hitherto, the carbonic acid gas employed in the manufacture of aërated bread has been solely obtained from carbonate of lime and sulphuric acid. The Aërated Bread Company are now carrying on experiments regarding the possibility of applying the carbonic acid of the great London breweries (now a wasted product) to the aëration of their bread, and the results hitherto obtained have been most satisfactory; while there is not the slightest doubt of the essential purity of the gas, in so far as deleterious matters are concerned, the delicate flavour of both hops and malt conveyed in the form of aromatic vapour by the gas to the dough communicates to the bread a singularly agreeable and palatable flavour.

No one who takes an interest in the sanitary conditions of various trades, and who has read Mr Tremenheere's 'Report on the Sanitary Condition of Journeymen Bakers,' drawn up in 1862, and published by order of government; or a very powerful article upon that commissioner's Report in the *Times* of August 1862; or a late pamphlet by Dr Guy on the same subject, can doubt that the general introduction of aërated bread would cause the saving of a large number of human lives, now annually sacrificed in the London bakeries alone. Dr Guy states that no class of men, save the Redditch needle-grinders, are liable to so severe and often fatal diseases of the chest. Forty-two years is rather over the average duration of life among them, and they are often completely enfeebled in very early life by frequent attacks of rheumatism. Under the new system, the business of a journeyman baker, from being almost certainly fatal, would become a healthy rather than a dangerous one. The evidence given in Mr Tremenheere's Report treats not only of the bakers, but also of 'the Bread we eat.' The statements made on the latter subject are so appallingly disgusting and filthy, that, in mercy to our readers, we decline to repeat them; and those who honestly desire to know how (at all events, in a vast number of bakeries) their bread is really made, may readily consult his Report.

The dietetic advantages of aërated bread are apparently so obvious, that it is surprising that they are not even more generally recognised than seems at present to be the case. Its perfect cleanness and purity, its light and uniform texture, and its sweet and agreeable flavour, are strong claims upon acceptance. To the working-man, it is especially suited, because it retains much of the ingredients of the wheat which enter into the formation of blood and muscle, and are allowed to escape in fermented bread. It is strongly recommended by medical men not only as an article of ordinary diet, but particularly in cases of indigestion; and according to Dr Corfe of the Middlesex Hospital, most especially 'in those cases of dyspepsia which so often affect the brain-workers of the great metropolis, men who work for the press, &c.' Mr Sanger, medical officer at the Convalescent Hospital, Seaford, has recently pointed out, amongst many medical uses of this bread, its use as a food for infants when they are brought up wholly or partially by hand. 'I have seen,' he observes, 'children pining away from diarrhœa and atrophy under a diet of common pap, or *Tout les Mois*, or any of the compounds which are vaunted as wonderful food for infants, recover in a very short time after the aërated bread has been substituted for them. This bread forms a soft jelly-like compound when mixed with milk and water, which is easily sucked through the tube of a common feeding-bottle, and with a little fine sugar, makes a food of which infants grow very fond.'—*Lancet*, December 10, 1864. Cases of indigestion, flatulence, &c., not unfrequently occur in which no kind of bread (even well-made country bread) can be borne with comfort. In such instances, if there is no ready access to aërated bread, it may be obtained weekly from the large cities, as it possesses the merit of being almost as palatable on the tenth day as on the day of its baking. See *Mechanic's Magazine*, March 24, 1865. For an account of French and Austrian bakeries and their bread, see W. E. Johnston, M.D., *Report on the Preparation of Bread*, *Rep. of Com. to Paris Exhib.*, Washington, 1868.

UNGHVA'R, an important market-town in the north-east of Hungary, is charmingly situated

* The statement in the article AËRATED BREAD, that 'in ten minutes or so it' [the dough] 'is taken out, shaped into loaves, &c.,' is hardly correct. It was *driven* or *projected out* by internal pressure through a temporary aperture made by a cock or tap

on the river Ungh, 90 miles north-north-east of Debreczin. It is the residence of a bishop, and contains a very old castle, a beautiful church, a seminary, and gymnasium. Wine is grown. Pop. 8537.

U'NGUENTS, or OINTMENTS, are employed in medicine as external applications. They consist of some active agent in solution or in the form of a soft extract, or in fine powder, carefully rubbed up with some kind of fatty matter, or a mixture of several such matters, as prepared lard, prepared suet, white wax, yellow wax, olive oil, and almond oil. There are no less than 28 ointments in the British *Pharmacopœia*. Some, as the ointments of aconitia, atropia, and belladonna, are employed to allay neuralgia and local pains; simple ointments (consisting of white wax, prepared lard, and almond oil) are employed in dressing raw and blistered surfaces; the ointments of cantharides and of savin are used to keep up the discharge from issues or blistered surfaces; the ointments of creosote, galls, carbonate of lead, oxide of zinc, &c., serve as astringents; those of ammoniated mercury, calomel, nitrate and red iodide of mercury, iodine, iodide of potassium, elemi, resin, and turpentine, act as astringents of varying power, and that of red oxide of mercury as a mild caustic. Many of the ointments are of special service in skin diseases, and sulphur ointment is the specific application for itch.

UNGUICULA'TA (Lat. clawed), in Zoology, a section of the class Mammalia, consisting of those animals which have toes furnished with nails or claws. In the system of Linnæus, it includes the orders *Bruta*, *Glires*, *Primates*, and *Feræ;* in that of Cuvier, the orders *Bimana*, *Quadrumana*, *Carnaria*, *Marsupialia*, *Rodentia*, and *Edentata*.

UNGULA'TA (Lat. hoofed), in Zoology, a section of the class Mammalia, consisting of those animals which have hoofs. In the system of Linnæus, it includes the orders *Belluæ* and *Pecora;* in that of Cuvier, the orders *Pachydermata* and *Ruminantia*.

UNGULED, in Heraldry, a term applied to the tincture of the hoofs of an animal; e. g., Azure, a stag trippant or, attired and unguled gules, the arms of the family of Strachan in Scotland.

U'NICORN (Lat. *unum cornu*, one horn), an animal probably fabulous, mentioned by ancient Grecian and Roman authors as a native of India, and described as being of the size of a horse, or larger, the body resembling that of a horse, and with one horn of a cubit and a half or two cubits long on the forehead, the horn straight, its base white, the middle black, the tip red. The body of the animal was also said to be white, its head red, its eyes blue. It was said to be so swift that no horse could overtake it. The oldest author who describes it is Ctesias, who resided for many years as physician at the court of Artaxerxes Mnemon, and who wrote about 400 B. C. His information, however, was all at second-hand. He calls it the Wild Ass (*Onos agrios*). Aristotle briefly mentions it under the name of Indian Ass, saying: 'We have never seen a solid-hoofed animal with two horns, and there are only a few of them that have one horn, as the Indian Ass and the Oryx.' Pliny nearly follows Aristotle, but says that the Indian Ass is one-hoofed, and the Oryx two-hoofed. He speaks also of the *Monokeros*, a very fierce animal, with the body of a horse, the head of a stag, the feet of an elephant, the tail of a wild boar, and a single horn. All these accounts are evidently untrustworthy, and much tinged with fable. Not more credible are those of more modern authors. Lobo, in his History of Abyssinia, describes the U. as resembling a beautiful horse; but there is no good evidence of the existence of any such animal there or in any part of the world. Its existence, however, is not to be decided against on any other grounds; for there does not appear to be anything monstrous or absurd in the notion. Although the descriptions of the U. given by the ancients are very unlike the Indian rhinoceros, yet probably that animal was the origin of them all. In like manner it seems probable that the head of a U., which Barrow saw depicted on the side of a cavern in South Africa, and the head of a U. described and figured by Campbell in his *Second Journey in South Africa*, are to be referred to some species of rhinoceros. The word U. is unhappily used in versions of the Old Testament for the Hebrew *rĕēm*. The Septuagint led the way in this, by using the Greek *monokeros;* and it has been supposed by many that the animal meant is a rhinoceros. The rĕēm was, however, certainly not a one-horned, but a two-horned animal. In Deut. xxxiii. 17, where the English version has 'horns of unicorns,' the correct translation is 'horns of a rĕēm.' Other circumstances, as an allusion to the gambolling of the young, are also unfavourable to the idea that a rhinoceros is intended.

The U. is perhaps best known as a heraldic charge or supporter. Two unicorns were borne as supporters of the Scottish royal arms for about a century before the union of the crowns; and the sinister supporter of the insignia of the United Kingdom is a unicorn argent, armed crined, and unguled or, gorged with a coronet composed of crosses patée and fleurs-de-lis, with a chain affixed, passing between the fore-legs, and reflexed over the back, of the last.

Unicorn.

U'NIFORM (one form), in its Military and Naval sense, means the particular dress and equipment assigned by proper authority to each grade of officers and men. The clothing consists of one prevailing colour, variously ornamented and 'faced' according to the rank and corps. Although some regiments wear other colours, scarlet may be said to be the prevailing uniform of the British army; blue of the French; and white of the Austrian; dark blue is likewise the colour of the British navy. It is surprising how late the introduction of compulsory uniforms took place. We find soldiers serving with corps and yet dressed after the dictates of their own fancy well into the 17th c.; while in the navy, uniforms were not fixed with certainty until the beginning of the reign of King George III.

UNIFO'RMITY, ACT OF. See NONCONFORMISTS.

UNIGE'NITUS, BULL, one of the most important documents in the history of Jansenism. It was occasioned by the publication of the *Réflexions Morales* of Quesnel (q. v.), in which all the essential principles of Jansenism were revived, and although cautiously, yet systematically explained, so as to form the basis of that practical, moral, and religious teaching which it is the object of the *Réflexions Morales* to convey. The book was at first simply prohibited by a brief of Pope Innocent XI., in the year 1708; but, as it found many patrons, and especially the Archbishop of Paris, Cardinal de Noailles, it was deemed necessary to subject it to a more detailed examination, the result of which was that 101 propositions were extracted from it, and formally condemned, in 1713, by a bull commencing with the word 'Unigenitus.' The mode of condemning these propositions was peculiar, being that which is technically called *Damnatio in globo*. The whole body of propositions were condemned

as 'heretical,' 'false,' 'rash,' 'scandalous,' 'offensive to pious ears,' &c.; without, at the same time, any particular propositions being pointed out as deserving any one of these specific forms of censure. This circumstance, with others, gave rise to much controversy, and to a prolonged opposition to the bull. De Noailles and other bishops refused to accept it unless with certain qualifications; on the contrary, Louis XIV. insisted on unconditional acceptance; but on the death of Louis, the Regent, the Duke of Orleans, having given his countenance to the opponents of the bull, the resistance was persisted in; and eventually a declaration was put forth in 1717, by certain bishops, four in number, appealing from the pope to a general council. This appeal was condemned by the pope, nor was it countenanced even by the Regent; but a more modified appeal 'from the pope ill-informed to the pope better-informed,' was afterwards published by De Noailles, which obtained many adherents, and by which the opposition was kept alive to the end of the pontificate of Clement XI. in 1721, and even under his successors, Innocent XIII. and Benedict XIII. It was not till the year 1730 that, after the formal registration of the Bull Unigenitus by the parliament of Paris, the party thus created in France, and known under the name of 'Appellants,' received its final condemnation from the civil authority, after which it gradually died out, although some relics of it are still traceable, even after all the storms of the Revolution, in the so-called 'Petite Eglise.' See GALLICAN CHURCH.

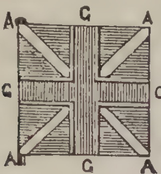
UNION. The crowns of England and Scotland were united under one sovereign on the accession of James VI. of Scotland to the English throne as James I. in 1603; but for above a century longer, each country continued to be ruled by its respective parliament, the interest of the one often coming into collision with that of the other. After various fruitless proposals for a closer connection of the countries, the Scotch were, in 1702, prevailed on to send 20 commissioners to London, who, with 23 English commissioners, should deliberate on the terms of a union. Their proceedings, after being broken off, were resumed in 1706. The Scottish commissioners were at first disposed for a mere federal union, and objected to the proposed assimilation of customs, excise, and regulations of trade; but a majority were at last brought over to the views of the English commissioners; and the minority, with one exception, yielded. The union, though popular in England, was the subject of great dissatisfaction in Scotland, being regarded by the bulk of the community as a surrender of national independence to a powerful rival. Addresses against it were presented from all quarters, and in some places the people rose in arms, forming regiments of horse and foot to oppose it. The treaty was, however, after strenuous opposition, ratified by the Scottish as well as the English parliament, and ultimately completed on May 1, 1707. Its principal conditions were the incorporation of England and Scotland into the United Kingdom of Great Britain, the succession of whose monarchs was to be the same as that of England. There was to be one parliament, in which the peers of Scotland would be represented by 16 of their number elected each parliament, and 45 Scotch members were to sit in the House of Commons. All rights and privileges were to be communicated between the subjects of both kingdoms, unless when otherwise agreed. The Episcopal Church was confirmed in England, and the Presbyterian in Scotland. Scotland was to retain her Courts of Session and Justiciary, and to have a separate seal for private rights and grants. While the parliament was to raise £2,000,000 by land-tax, Scotland would contribute £48,000 of that sum. The laws of trade, customs, and excise in Scotland were to be assimilated to those of England, and the coinage, weights, and measures of the two countries were to follow a uniform standard. In other matters, the laws of Scotland were to remain in force, but might be altered by the parliament of Great Britain. The separate Privy Council of Scotland, which the Act of Union left untouched, was abolished the following year.

Ireland remained a distinct kingdom till 1801, when it was united with Great Britain into the United Kingdom of Great Britain and Ireland. By the terms of the union, the separate parliament of Ireland was done away with, and Ireland was represented in the parliament of the United Kingdom by 4 lords spiritual and 28 lords temporal in the House of Lords, and 120 members of the House of Commons. Power was reserved to the sovereign to create one peer of Ireland for every three extinct peerages, and when the peerage of Ireland became reduced to 100, to create one peerage for each one that became extinct, so as to keep the peerage of Ireland up to 100, over and above those Irish peers who are also peers of England or Great Britain. The churches of England and Ireland were united into one Protestant Episcopal Church. The subjects of Ireland were placed on the same footing as those of Great Britain in respect of trade and navigation, and in all treaties with foreign powers; and the law-courts of Ireland were to continue, subject to the regulations of parliament; writs of error and appeals being decided by the House of Lords.

UNION COLLEGE, Schenectady, New York, was incorporated in 1795, chiefly by the efforts of General Philip Schuyler. It was named Union from its being established by the co-operation of several religious denominations. Its first president was John Blair Smith of Philadelphia, who was succeeded in 1799 by Jonathan Edwards, the younger; but its great prosperity and usefulness were secured under the presidency of Rev. Eliphalet Nott, from 1804 until his death in 1866. By his zeal, enterprise, and large benefactions, it was endowed and furnished with spacious buildings, a large library, and extensive cabinets of natural history. Dr Nott was succeeded by Dr Laurens P. Hickok, the distinguished metaphysician. In 1869, Dr Aiken of Princeton was called to the presidency. Resigned in 1871; when Dr Eliphalet N. Potter, son of Bishop Alonzo Potter, and grandson of Dr Nott, was made president. Under his administration the institution has increased in funds and students. In its general aims it has been greatly enlarged by a connection with the Law and Medical Colleges at Albany, and now, together with them, bears the name of Union University, of which the president of Union College is the chancellor. It has 14 professors, 160 students, and a library of about 12,000 volumes.

UNION-JACK (from the *jacque*, or surcoat, charged with a red cross, anciently worn by English soldiers—see JACK), the national banner of the United Kingdom of Great Britain and Ireland, formed out of a combination of the crosses of St George (argent, a cross gules), of St Andrew (azure, a saltire argent), and of St Patrick (argent, a saltire gules), these three crosses being the national banners of England, Scotland, and Ireland respectively. The first union-jack, which was introduced by a royal proclamation in 1606, three years after the union of the Scottish with the English crown, combined only the crosses of St George and St Andrew, and may be blazoned, azure, a saltire argent surmounted by a cross gules edged of the second. This combination was by royal proclamation of date 28th July

1707, constituted the national flag of Great Britain (fig. 1). On the union with Ireland, a new union ensign was devised, in which the cross of St Patrick was introduced, with its four limbs edged with white on one side. This awkward specimen of heraldry



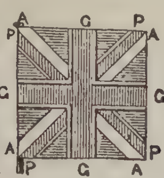


Fig. 1. Fig. 2.

G, St George's Cross; A, St Andrew's Cross; P, St Patrick's Cross.

forms the second and now existing union ensign (fig. 2). Generally speaking, it is displayed as a national ensign on flags only; but the reverse of the bronze coins of the realm contains a not very accurate representation of it on the shield of the seated figure of Britannia. The inaccuracy consists in the crosses of St Andrew and St Patrick being made to assume the appearance of a single saltire with a narrow border of equal width on each side.

UNITA'RIANS, a name applied generally to all who maintain that God exists in one person only, and specially to a small Christian sect of recent times, whose distinguishing tenet is the Unity as opposed to the Trinity of the Godhead. In the more general sense, the name of course includes the Jews and the Mohammedans as well as those Christians who deny the doctrine of the Trinity, and in this sense also there have been U. from the earliest period of ecclesiastical history. Until the middle of the 2d c., there seems to have been no controversy upon the subject; but from that time to the end of the 3d c., there was a succession of eminent teachers who maintained, against the ecclesiastical doctrine of the Logos, the undivided unity—or, as they expressed it—the *Monarchy* of God. From their use of this word, they are known in ecclesiastical history as the Monarchians. There are generally understood to have been two classes of them—those who taught that Christ was God in such a sense that it was the Father who became man, and was born and suffered, and who were, on this account, called by their opponents Patripassians; and secondly, those who held that Christ was in nature a mere man, but exalted above all other prophets by the superior measure of Divine wisdom with which he was endowed, and who therefore corresponded more nearly with the modern Unitarians. It is right to notice, however, that the doctrines of the Monarchians are known to us only through the statements of opponents, and it is probable they would have disowned the more extreme views ascribed to them. To the former of the two classes we have mentioned belonged Praxeas, against whom there is a treatise by Tertullian, and Noetus; and at a later period—about the middle of the 3d c.—the famous Sabellius taught very similar doctrines. The other class was represented by Theodotus, Artemon, and especially Paul of Samosata, Bishop of Antioch, who was eventually deposed on account of his heresy. Beryllus, Bishop of Bostra in Arabia, who is said to have been convinced of his error by Origen, would seem, from the single sentence which records his teaching, to have belonged to this class rather than the other. The Monarchians appealed in support of their doctrines to the Old and New Testaments, and to the early opinions of the church. They are said, by Tertullian, to have consisted of the simple and the unlearned—'always,' he adds, 'a majority of the faithful'—a statement which shews that they must have been tolerably numerous in his time; while a writer quoted by Eusebius brings against them the apparently opposite charge of being students of geometry and lovers of Aristotle.

The grand theological struggle which followed in the 4th c. between the Arians and the Athanasians may be regarded as but another phase of the Unitarian controversy, inasmuch as Arius held that the Son was a created being, and denied his consubstantiality with the Father. On this head, the reader may consult the articles ARIUS and ATHANASIUS. We now pass on to the post-reformation period.

It is not strange that in the great stir of thought which accompanied the Reformation, some should have been found bold enough to question the grand catholic doctrine of the Trinity. Such there were even before the Socini. See SOCINUS. Among the earliest may be mentioned Hetzer and Bassen, both of whom were executed in 1529, the former, however, not exclusively for his religious opinions; Denck, Campanus, and the famous Spaniard, Michael Servetus (q. v.). So widely, indeed, was the Unitarian doctrine diffused that it was thought necessary, in the first article of the Augsburg Confession, to condemn the modern Samosatans, who deny the personality of the Word and Spirit, declaring the former to be a proper spoken word, and the latter a divine influence; and as early as 1527, one Andr. Althamer published a work against 'the modern Jews and Arians under a Christian name, who deny the Deity of Christ.' Under the influence of the elder Socinus, Unitarianism gained many adherents in Venetia. Poland and Transylvania, however, became its principal strongholds, and in those countries, favoured by circumstances, it struck the deepest roots. In Poland, the nobility, protected from persecution by their class privileges, proved singularly favourable to a movement which seemed more destructive of the traditions of the Catholic Church than any that had yet been entered upon; the Unitarian refugees from other countries found here a ready welcome; and in the reign of Sigismund II. (1548—1572), this party of reformers was strong enough to form itself into a separate church. At a rather later period, Poland was the principal field of labour of the younger Socinus, and Unitarianism continued to flourish there till the middle of the 17th c., when, under John Casimir, who before his elevation to the throne had been a cardinal and a Jesuit, it was extirpated by force. In Transylvania, the U. have succeeded in maintaining their existence, notwithstanding much opposition and persecution, from the Reformation to the present day. The first who openly preached Unitarianism in that country were George Blandrata and Francis Davidis (1565), and under the influence of these distinguished men, large numbers, including the king himself, embraced the new opinions. But this period of prosperity was not of long duration. In 1572, though still permitted to worship according to their conscience, the U. were forbidden to make any attempts at propagandism, or even to print their religious books. They were not, however, subjected to any violent persecution until after the incorporation of Transylvania with the Austrian Empire, which took place in 1690; but after that time they were robbed by the Roman Catholics of all their churches and church property, forbidden to build new churches without the permission of the emperor, and by degrees excluded from all government offices, even the very lowest. On the accession of Joseph II., happier times returned. Their churches were forbidden to be seized, and an indemnity was even paid them for the loss of the

cathedral church of Klausenburg. They were now enabled to build new churches, and their cathedral and college at Klausenburg are said to be still two of the finest buildings in that city. The U. of Transylvania number about 56 000, and are said to be increasing. They have an organised system of church government, with a bishop at its head. They have three colleges—that of Klausenburg, with 12 professors and 273 students; that of Torda; and that of St Keresztur.

In England, Unitarian opinions were somewhat later in making their appearance than on the continent. As early, indeed, as 1548, a priest named John Ashton was accused of Arianism, and escaped with his life only by recantation; and during the reigns of Edward VI., Mary, Elizabeth, and James I., a few suffered martyrdom on similar charges. But during the reign of James I., continental Socinianism began to exercise considerable influence in England, and continued to do so to the end of the century, so much so that, in 1665, Dr Owen wrote that 'the evil is at the door, that there is not a city, a town, scarce a village in England, wherein some of this poison is not poured forth;' and how deeply the Church of England was infected with it may be inferred from the no doubt exaggerated statement of Palmer, who, in 1705, spoke of 'troops of Unitarian and Socinian writers, and not one dissenter is found among them.' Many eminent men of the time, including Milton, Locke, and Newton, and in the next century, the famous apologist, Lardner, must be numbered among the U.; but it was in the last decade of the 17th c. that the controversy on this subject was most active, and at this time were published the old Unitarian tracts—a series of anonymous writings marked by eminent learning and talent. Hitherto, however, the U., with the exception of the society formed in London by John Biddle (q. v.), which did not survive its founder, had no organised existence. But after the passing of the Toleration Act in 1689, whereby Nonconformity was made legal, the way was prepared for that gradual change by which the orthodoxy of the English Presbyterians passed into Unitarianism. It was at this time that most of the old Presbyterian chapels were founded, and the trusts being open —i. e., not committed to any doctrinal system—ministers and people were left free to adopt and promulgate whatever new opinions should approve themselves to their conscience. Thus, the U. are the legitimate successors and representatives of the 2000 Presbyterian divines who in 1662 left the Church of England in consequence of their inability to comply conscientiously with the terms of the Act of Uniformity. The ground of this separation, it should be understood, was no difficulty about the doctrinal articles of the establishment. The English Presbyterians (so called from their preference for that form of church government, for they were never able to adopt it) were originally as orthodox as their Episcopal brethren; but having refused to commit themselves to any authoritative creed, they underwent a gradual change to Arian, and at length to Unitarian, views. Many preached such views without exciting attention or controversy, and indeed, until 1813, the law which made it blasphemy to speak against the Trinity, though not strictly enforced, was still in existence. During the latter half of the 18th c., Dr Priestley (q. v.) appeared as the champion of the humanitarian view of Christ's nature, and, by the influence of his writings, secured the more open advocacy of that doctrine. In 1774 Dr Lindsey resigned his charge in the Church of England, and became pastor of the Unitarian congregation of Essex Street, London—an event which may be regarded as an epoch in the history of English Unitarianism. In 1813, the U. were placed by law fully on a par with other dissenters, and since that time there has been no attempt at persecution, with the exception of the claim made to some of their properties by certain orthodox dissenters. This claim was met by the Dissenters' Chapels Act in 1844. The U. of England and Wales are purely congregational in their church government, their only organ for combined action being the British and Foreign Unitarian Association, which holds its meetings annually in London. Their principal place of education is Manchester New College, London, which is, however, an unsectarian institution. They have also a missionary college in Manchester and the Presbyterian College, Caermarthen, educates Independent and Unitarian ministers. They have at present (1866) about 314 chapels and mission stations.

In Scotland, the religious atmosphere has never been very favourable to Unitarianism. It was in that country that the last execution for blasphemy against the Trinity took place in the person of the unfortunate Aikenhead. Nevertheless, towards the close of the 18th c., there was a certain amount of Arianism among the Moderates in the Church of Scotland. Unitarianism, as a distinct system, was preached at Montrose as early as 1783; and at the beginning of the present century, some attempts were made to diffuse it by means of missionary efforts. There are now five congregations in the country. That at Edinburgh was originally a branch from the Cameronians, the strictest of Calvinists, but having adopted the principle of free inquiry, they gradually embraced Arian, and eventually humanitarian, views. This last change took place during the ministry of the late Dr Southwood Smith, about the year 1812.

In Ireland, the history of Unitarianism is intimately connected with that of Presbyterianism. It flourishes principally in the north of the island, where there is a strong infusion of Scotch blood, and where Roman Catholicism has the least influence. There are about 40 congregations. The U. of Ireland are Presbyterians in fact as well as in name.

Unitarianism in the United States has passed through much the same phases as in Great Britain. After 1740, Arian views of the person of Christ were pretty widely diffused among the New England clergy; and in 1787, took place the first secession from the Episcopal Church, on the ground that those parts of the liturgy which imply a belief in the Trinity could not be any longer employed. From the first, the New England churches were remarkably free from the restraints of tests and creeds, and were thus prepared for the adoption of a liberal theology. By imperceptible degrees, many of them glided into Unitarianism; but it was not until about 1815 that the name began to be much used. At that time, the influence of Dr Channing (q. v.) was thrown into the scale; and since then, Massachusetts, and particularly Boston, has been the stronghold of Unitarianism in America. The U. have about 256 societies in the States, and upwards of 20 in Boston alone. Harvard University, Cambridge, is not a denominational institution; but it is at present in the hands of the U., and most of their ministers are educated either there or at the Meadville Theological School, Pa. Besides the U., properly so called, the Universalists, the 'Christians' of America, and the Hicksite Quakers, are understood to hold anti-Trinitarian sentiments, though they give no special prominence to the doctrine of the Divine Unity. When we have mentioned, further, that there are a few Unitarian churches in the principal colonies of Great Britain, we shall have made a sufficiently complete enumeration for the purposes of

this sketch. We have, however, to add, that Unitarian sentiments, under the names of Liberal Christianity and Rationalism, are more or less widely diffused in France, Switzerland, Germany, and Holland.

We now proceed to give a brief sketch of the theological opinions by which U. are distinguished from other Christian sects. It is, of course, impossible that we should notice all the phases of belief they have passed through since the Reformation. We confine ourselves to stating the more important doctrines of the early Socinians, as they are set forth in the Racovian Catechism, and sketching rapidly the opinions of the modern U. of England and America.

The Socinians assumed, as the fundamental principle of their theology, the sufficiency of Scripture, or rather of the New Testament, which, they held, had, for all matters of faith, superseded the Old. According to their system, Christ was a true man, but conceived of the Holy Spirit; and on account of the Divine power which he has received from the Father, and his exaltation as head over all things, he is to have worship offered to him. The Holy Spirit is not a person, but a Divine influence. The Socinians rejected also the doctrine of original sin. Man, they taught, was created with a mortal nature, but by the special gift of God, was endowed with a conditional immortality. He was created innocent, but not positively righteous. The gift of immortality he forfeited by disobedience. The fall of Adam, however, being a single act, could not deprave his own nature, much less that of his posterity; and in the latter, death was not a consequence of the fall, but was simply the condition of birth and life. Thus, the actual consequence of Adam's fall was not any radical corruption of human nature, whereby it was impossible for man to do any good thing, but rather a moral deterioration, producing, with repeated acts of disobedience, an increasing tendency to sin. Man, after the fall, retained his free will, and the power of abstaining from sin if he so pleased. On the question of the merits of Christ, the Socinian doctrine was essentially different from that of all the other Protestant sects. Christ's merits did not consist principally in his death, but in his life, his teachings, and his example. Nor was his death regarded as an atoning sacrifice, or as having any vicarious efficacy whatever, but simply as a confirmation of God's will, and the seal of the new covenant. Christ died for our sins—first, that all sinners might in this way have the assurance of forgiveness and of eternal life; secondly, that they might be drawn to Christ, and led to seek through him alone remission of their sins; and thirdly, that God might thus testify His boundless love to the human race, and might reconcile it to Himself. But the crucifixion was important chiefly as preparing the way for the great crowning miracle of the resurrection. Here, in fact, not Christ's death, but his resurrection, is the central point of the Christian scheme. By this he confirmed his doctrine of immortality, and prepared for his ascension into heaven, where he now fills the office of our great High Priest. Jesus 'frees us from the punishment due to our sins, in that he continually protects us by the virtue and power which he has received from the Father, and by his intervention, defends us, as it were, from the wrath of God; and he frees us from servitude to our sins, by drawing us away from every kind of vice, and shewing us in his own person the reward of him who abstains from sin.' Predestination in this system means the decree of God, made before the foundation of the world, that they who believed and were obedient should be saved, and that they who believed not and were disobedient should be damned. Justification takes place when God pardons our sins and gives us eternal life. The Socinians regarded the sacraments as simply external signs testifying to Christian faith. Hence they held infant baptism to be irrational as well as unscriptural, but thought that a custom so old and established should be tolerated.

It need scarcely be said that the systematic theology of the early Socinians is in this country quite a thing of the past; indeed, the English U., though undoubtedly more or less influenced by their continental brethren of the Reformation period, have with the latter no very direct historical connection. They seem rather to have arrived at independent conclusions, through their 'rational' interpretation of Scripture, and their consistent rejection of human authority in matters of faith. The U. of the present day, like almost all Christian sects, must be divided into two classes—a conservative and a progressive class—or, as they are often called, an old and a new school. The former adopt the old rule of the sufficiency of Scripture, though with many such qualifications as the scientific criticism of the Bible has rendered indispensable. The most conservative U., for example, would not contend for the literal truth of the first chapter of Genesis, nor for the doctrine of verbal inspiration in any shape. The Bible *is not*, but it *contains*, the Word of God, is the form which best expresses their position on this subject. They generally hold the simple humanity of Christ, and even reject the supernatural birth, thinking the part of the gospels which record that event to be less authentic than the parts referring to the ministry, the death, and resurrection of Jesus. To the death of Christ they ascribe much the same kind of efficacy as we have seen was ascribed to it by the Socinians, regarding his teaching and example as the most essential part of his work, and his death as an attestation to the truth of his mission, and a preliminary to his resurrection. What, however, chiefly distinguishes the U. of this school from those of the new or progressive school, is the place which they give to the miracles as supernatural sanctions of the truth of Christianity. In this respect they must be considered as still under the influence of Locke's philosophy and the theology of Dr Priestley. Denying that man has any immediate knowledge or intuition of spiritual things, they regard Christianity as a system of moral and religious truth external to man's nature, and requiring, in proof of its Divine origin, certain evidence beyond its inherent credibility and adaptation to human wants. This evidence they find in the miracles, which they accept as well-attested facts, on the same ground on which all historical facts are accepted. 'If there be any truth in history,' says Dr Priestley, whose influence can still be traced in the U. of this school, 'Christ wrought unquestionable miracles, as a proof of his mission from God; he preached the great doctrine of the resurrection from the dead; he raised several persons from a state of death; and, what was more, he himself died and rose again in confirmation of his doctrine. The belief of these facts I call the belief of Christianity.' According to this view, therefore, Christ is an ambassador from heaven to earth; the miracles he wrought are his credentials; and the moral and religious truths which he taught are his message. It is not indeed denied that many or all of those truths might be learned from the light of nature, but they have received from Christianity a sanction which gives them a greater degree of certainty than they could otherwise possess. The U. of the progressive school, on the other hand

have abandoned the philosophy of Locke for more spiritual modes of thought. So far from regarding man as entirely dependent upon his reasoning powers for his knowledge of religion, they rather look upon him as standing in a living relationship with the one infinite source of all truth, and as having within his own nature the germs of the highest religious faith. Christianity, accordingly, they regard not as a *message* or a system of truth communicated and authenticated from without, but as the highest expression of the Divine in humanity —an expression not necessarily preternatural, but connected with the previous history of mankind by the natural laws of moral and spiritual development. To this view of Christianity, the miracles are not felt to be essential as proofs; and the truths of the gospel are thought to be quite unaffected by any judgment regarding them. The U., however, of this school, while, from their point of view, they regard the question of the miraculous as one of critical rather than religious interest, yet generally accept the miracles as historical facts, considering that there is sufficient evidence to prove that they took place. A few, but an increasing number, agree with Theodore Parker and many of the German critics in rejecting them on the twofold ground, that they are intrinsically incredible, and that the evidence for them is conflicting and uncertain. Generally speaking, the U. of this school, like the so-called Broad Church men, are disposed to regard with favour the freest criticism of the Bible. Holding that inspiration is a quality which is not peculiar to the Bible, but common to all the most elevated religious literature, and that it in no case implies immunity from error, they maintain that the Scriptures must be subjected to the same rules of criticism and interpretation as any other book, and that each book of Scripture is to be studied not as a collection of infallible oracles, but as a record of the mind of the age in which it was produced. In this light, however, and also as a record of the grandest religious movements of the world's history, they hold the Bible in the highest estimation. Such is a statement, necessarily imperfect, of the peculiarities of the two Unitarian schools in their extremest divergence from one another; it need scarcely be added that in fact they merge into each other by imperceptible gradations.

It will, of course, be understood that the U. of all shades of opinion are agreed in rejecting the entire orthodox scheme—including the doctrines of the Trinity, the vicarious atonement, the Deity of Christ, original sin, and everlasting punishment—as both unscriptural and irrational. They celebrate the Lord's Supper in their churches, not as a sacrament, but as a service commemorative of Christ's death, and expressive of spiritual communion with him. They also adhere generally to the rite of infant baptism, though there are a few Unitarian Baptist churches. In recent years, the U. have given renewed prominence to the principles of Comprehension and of Free Inquiry apart from the restraints of theological creeds, conceiving that in this they are conforming to the spirit of their Presbyterian forefathers; and many even object to the name Unitarian, as one which might be held to imply a doctrinal bond of union, and to be, to that extent, inconsistent with the fundamental principles of the body, which both now and in former times have always included unrestricted freedom of religious thought. It is impossible here to explain at greater length the Unitarian position; but it may be mentioned, as an important fact, that when, at the meeting of the British and Foreign Unitarian Association held in 1866, it was proposed to add to the rules a clause defining 'Unitarian Christianity,' the motion was almost unanimously rejected. The motion was intended as a protest against anti-supernaturalism. Its rejection, on the other hand, was an assertion of the principle of comprehension and freedom, and was voted for by those who sympathised doctrinally with the proposer, as well as by those who differed from him.—For fuller information on the history and doctrines of the U., the reader may consult Dr Beard's *Unitarianism in its Actual Condition;* the Rev. J. J. Tayler's *Religious Life of England;* Otto Fock's *Socinianismus;* and Lange's *Geschichte und Lehrbegriff der Unitarier vor der Nicänischen Synode.*

UNITED GREEKS. See GREEK CHURCH.

UNITED PRESBYTERIAN CHURCH, the name of a religious body in Scotland, which was constituted in 1847 by the amalgamation of the SECESSION and RELIEF CHURCHES, whose origin and history we propose briefly to narrate.

The SECESSION CHURCH.—The causes which led to the formation of the Secession Church, in order to be thoroughly understood, would require to be unfolded at much greater length than our space permits. But some notice of them, however brief, is absolutely necessary. It is well known that the Reformation from popery in Scotland was a very radical and decisive affair in regard to both the doctrine and government of the church. The people became strongly Calvinistic and Presbyterian; and after the accession of James to the English throne (1603), their attachment to their ecclesiastical system became stronger still. The efforts of that monarch to supplant it by Episcopacy proved unavailing, so far as the great body of the commons and gentry were concerned; but moved by various considerations, into which religious conviction entered only as a very subordinate element, many of the Scottish nobles adopted the church principles of their sovereign, and after the Restoration (1660), supported the governments of Charles and James in their persecution of the Covenanters. See COVENANTS; SCOTLAND; SCOTLAND, CHURCH OF. At the meeting of the Scottish Estates in 1690, Episcopacy, which, in Scotland, had obtained a temporary supremacy under the rule of Sharp (q. v.) and Lauderdale, and had, besides, become synonymous with adherence to the House of Stuart, was abolished, and Presbyterianism re-established. One unavoidable consequence of this was the abolition of the *right of patronage*, for in a multitude, probably the great majority, of cases, the exercise of this right would have placed the nomination to ecclesiastical benefices in the hands of Episcopalian landholders, and thereby imperilled the existence of a sound Presbyterian ministry. But although there were still many zealous Presbyterians in Scotland, especially among the peasantry, the spirit of the nation as a whole had gradually undergone a great, and, in the opinion of some, a disastrous change, so far as religion was concerned. A kind of torpor seized the upper and middle classes after the 'glorious Revolution,' and earnestness growing unfashionable, was sneered at as fanaticism. A proof of the latitudinarianism of the times is the fact, that some hundreds of Episcopalian curates were allowed to retain the parishes in which they had been arbitrarily stationed, on subscribing the *Confession of Faith;* and great numbers of laymen became elders in a church whose strict adherents they had themselves but recently hunted even to death. This obtrusion into the church of curates whom Bishop Burnet describes as 'the worst preachers I ever heard, ignorant to a reproach, and many of them openly vicious, produced, as may easily be conceived, a pernicious

influence on the purity of ecclesiastical discipline; and in 1712, when the obnoxious *Law of Patronage* was restored, the triumph of the court of 'moderate' party in the church may be regarded as complete. See MARROW CONTROVERSY. Violent settlements, effected by the agency of dragoons, now became frequent, and greatly irritated the people, whose petitions and appeals were almost invariably disregarded; and finally, in 1730, the Assembly enacted that in future no reasons of dissent 'against the determinations of church judicatures' should be entered on record. This attempt to gag the mouths of congregations was more than some could bear, and in October 1732, the Rev. Ebenezer Erskine of Stirling, in a sermon delivered in his capacity of moderator before the synod of Stirling and Perth, denounced in solemn and impassioned words the recent legislation and spirit of the church. A committee was immediately appointed to consider the matter, and reported rather vaguely but unfavourably at the ensuing meeting of synod; in consequence of which, Mr Erskine, after three days' 'warm reasonings,' was found deserving of censure by a majority of six. He immediately protested (as did also twelve other ministers and two elders), and appealed to the next General Assembly, which sustained the decision of the synod, and ordered the rebuke and admonition to be administered, 'in order to terminate the process.' Erskine, of course, had to submit to censure, but left a written protest on the table of the Assembly, in which he declared his intention to continue testifying against the 'defections' of the time. This protest was also signed by William Wilson, minister of Perth; Alexander Moncrieff, minister of Abernethy; and James Fisher, minister of Kinclaven. The Assembly was indignant, and next day ordained 'that the four brethren appear before the Commission in August next, to express sorrow for their conduct, and retract their protest;' on pain of being suspended from their ministry. This they refused to do, and in consequence were declared 'no longer ministers of the church' (November 1733), whereupon they handed in a final written protest, in which, after referring to the 'defections from our reformed and covenanted principles' of the 'prevailing party,' they protested that they were obliged TO MAKE A SECESSION FROM THEM, and appealed unto the first free, faithful, and reforming General Assembly of the Church of Scotland.

This was the origin of the famous 'Secession Church,' which has made so deep an impress on the religious life of Scotland. At first composed of only four ministers, it rapidly began to gather strength. Little Christian societies were everywhere formed, which were gradually supplied with pastors either from the Establishment, or from pious youths trained to the work of the ministry by Erskine and his friends. Erskine and his friends drew up a statement of their reasons for separation, which was published under the title of *A Testimony to the Doctrine, Worship, Government, and Discipline of the Church of Scotland, or Reasons (by the Four Brethren) for their Protestation entered before the Commission of the General Assembly.* This document, which afterwards came to be known as the 'First or Extra-judicial Testimony,' presented in a polemical or argumentative form those facts in the later history of the Church of Scotland at which e have already glanced; and is of great value ith reference to a proper understanding of the rounds of secession. From it we learn that it was *not* one thing only, not even the unpopular law of patronage' (as has sometimes been carelessly imagined and asserted), that induced Erskine and his friends to leave the church of their fathers; but an accumulation of grievances that in their eyes had become insupportable. In short, the Secession Church had a *religious*, and not a *political* origin. What the 'four brethren' sought was the vindication of what they held to be evangelical truth, much more than of the mere right of 'popular election.' So much popular indignation was excited by the deposition of the 'four brethren,' that it was thought desirable by the majority of the 'Moderate party' to make certain concessions to the 'Evangelicals,' or 'Marrow party,' lest the spirit of insurrection should grow, and perhaps overturn the Establishment. Accordingly, the General Assembly of 1734 passed some measures distinctly favourable to the latter party, and curiously contrasting with their former procedure; and finally, on the last day of the sittings, empowered the 'synod of Perth and Stirling' to remove the censures from the four brethren, and to restore them to their respective charges. This was done; and to shew how far their new-born cordiality could go, the synod proceeded, in Mr Erskine's absence, to elect him 'moderator;' but Mr Erskine declined to be 'reponed,' and gave his reasons in a letter to the Stirling presbytery, and in a pamphlet subsequently published. In December 1736 appeared the pamphlet entitled *An Act, Declaration, and Testimony for the Doctrine, Worship, Discipline, and Government of the Church of Scotland*, commonly known as the 'Judicial Testimony,' which is a sort of survey of the whole ecclesiastical history of Scotland from the Reformation downwards, in which all the 'instances of defection and relapse are marked and judicially condemned.' In 1737, the Rev. Thomas Mair of Orwell, the Rev. Ralph Erskine of Dunfermline, the Rev. Thomas Nairn of Abbotshall, and the Rev. James Thomson of Burntisland, joined the original 'four.' The church authorities, filled with anger and alarm, now resolved to proceed to extremities against the seceders. In 1738, the 'commission,' obeying the injunctions of the Assembly of that year, libelled the 'Eight Brethren,' and summoned them to appear before the Assembly of 1739, which they did—having, however, first drawn up and passed an act entitled a *Declinature*, in which they disclaimed the authority of the Established courts. One final effort was made by the Assembly to bring them back to the bosom of the church, but it failed—the 'brethren' adhering strictly to all their former protestations and testimonies; and after a 'year of grace,' the General Assembly of 1740 solemnly pronounced their deposition, and the connection between Erskine and the church of his fathers was for ever at an end.

It is not necessary to describe minutely the gradual extension of the 'Secession movement' among the people of Scotland, but we may mention, that in spite of the frequent refusal of sites for churches, and other modes of persecution, the cause abundantly prospered; and after a few years, the 'Secession Church' came to be recognised as a really important body, both from the number of its congregations, and the grave, serious, and solid character of its members.

In 1747, a rupture or 'breach' took place in the new body on the question of the burgess-oath, some affirming that this oath could not be taken by any consistent Seceder, and others insisting that it could, and that the question regarding it ought to be matter of mutual forbearance. The party condemning the religious clause in the burgess-oath formed the *General Associate Synod*, or popularly the *Anti-burgher Synod;* the party tolerating it, the *Associate* or *Burgher Synod.* Subsequently, a second split occurred in each of these, and two other trivial denominations were

formed, the one assuming the designation of the *Constitutional Associate Presbytery*, or *Old Light Anti-burgher* (1806); and the other, the designation of the *Original Burgher Presbytery*, or *Old Light Burghers* (1799). After holding aloof from each other for more than 70 years, the Burghers and Anti-burghers began to approximate once more, and finally, on the 8th September 1820, in Bristol Street meeting-house, Edinburgh, the synods of the two long separated branches of the Secession were solemnly re-united. At the date of the 'breach' (1747), the number of Secession congregations was 32; when the reunion took place, it had increased to 262. Henceforward, the history of the Secession Church exhibits a course of uninterrupted prosperity. A certain change, however, now begins to shew itself in the character and spirit of the denomination. Hitherto, Seceders had worn a sort of *old-world look*, if we may use these words respectfully; their thoughts and interests in matters ecclesiastical centred round bygone times and events; their very language, like their sentiments, was archaic, and fell coldly upon all but the devoutest ears. Now, however, the wants of the modern world made themselves felt even in the narrow circles of Scotch dissent. In a word, they came under the liberalising influences of the new-born enthusiasm for foreign missions, and started 'stations' in Canada, Jamaica, Trinidad, Calabar, &c. So vigorously was this important branch of Christian work carried on, that in 1847, at the period of the union of the Secession and Relief Churches, the former was found to be supporting a staff of more than 60 missionaries in different parts of the world. Further, the *Secession* Church began to assume an attitude more distinctly antagonistic to the Establishment. Though it has never formally avowed the *voluntary* principle (see VOLUNTARYISM), yet the fact that it has maintained itself *ab initio* by voluntary effort, has had the effect of determining the great majority of the pastors and people to adopt this principle. A variety of circumstances, partly political and partly ecclesiastical, led to a great controversy between leading divines of the Establishment and of the Secession, known as the *Voluntary Controversy* (1829—1834), which served to strengthen the voluntaryism of the Seceders, and brought them more closely into connection with the Relief Church (see below), whose theoretical voluntaryism was perhaps still more pronounced. Next followed the famous *Atonement Controversy*, in which the Secession Church signalised itself by an adherence to the liberal evangelical theology of the Marrow, and on this vital point also it had the sympathy and support of the Relief body. The desire for union between the two denominations now became stronger than ever. Committees were appointed, and conferences held; and at length on the 13th May 1847, in Tanfield Hall, Edinburgh, the union of the Secession and Relief was formally accomplished, and the two churches, abandoning the names by which they had hitherto been known, formed themselves into one body under the designation of the UNITED PRESBYTERIAN CHURCH.

We now revert to the RELIEF CHURCH, whose history and fortunes we shall briefly narrate. After the expulsion of Erskine and his friends from the Church of Scotland, the assemblies (packed with 'Court of Session elders') became more determinedly 'moderate' than ever. The split that occurred among the Seceders in 1747 convinced them that they had now little to fear from the aggressive zeal of their opponents, who had taken to quarrelling among themselves; and, desiring to stand well with government for various reasons, they boldly resolved to deprive the people of all right to elect, or in any way to interfere with the election of, ministers. Never were forced settlements more shameless than about this period; but it has been well remarked, 'there is a point at which oppression becomes intolerable; and to a religious people, no oppression is half so galling as that which is spiritual.' *Relief* was felt to be a necessity, and relief came in the person of the Rev. Thomas Gillespie, minister of the parish of Carnock, near Dunfermline. The circumstances which brought him into collision with the General Assembly were these: In 1749, the Rev. Andrew Richardson was presented to the parish of Inverkeithing by the patron, Captain Philip Anstruther; but the presentation proved so extremely unpopular that the presbytery of Dunfermline refused to proceed with it. In 1750, the case came before that high-handed body, the 'Commission of the Assembly,' who ordered the presbytery to proceed at once to induct Mr Richardson. This mandate they firmly refused to obey; and when, after much discussion, the affair again came before the Commission in March 1752, it was resolved to transfer the onus of the unpopular settlement from the shoulders of the presbytery of Dunfermline to those of the synod of Fife. This compromise did not satisfy the out-and-out Moderates in the Church of Scotland. It was therefore resolved to make an example of the presbytery of Dunfermline at the ensuing Assembly. On 18th May, the 'Inverkeithing case' came on, and after a brief but animated debate, the conduct of the 'Commission' was condemned by the Assembly without coming to a vote; the presbytery of Dunfermline was ordered to induct Mr Richardson on Thursday the 21st, and on the day following to appear at the bar of the Assembly. The presbytery did *not* meet on Thursday—at least a *quorum* did not—and Mr Richardson was consequently not inducted. On Friday, six ministers of the presbytery—Robert Stark, David Hunter, Thomas Gillespie, Alexander Daling, Thomas Fernie, and John Spence—handed in a 'representation,' explaining why they could not obey the commands of the supreme court. They were warned by the moderator of the danger in which they stood, and were finally informed that if they remained obdurate, *one* of them should be deposed. Next day, they were called in *singly*. Stark, Fernie, and Hunter all wavered and shifted their ground a little; Daling and Spence said nothing; but Gillespie was ready with a second 'representation.' This was enough. Gillespie was fixed on as the most suitable sacrifice, and almost without trial, without a libel or any formal process whatever, he was arraigned, cast, condemned, and deposed. The majority of the General Assembly, corrupt as its composition undoubtedly was, seems to have shrunk from active participation in the deed. Out of 158 members present, only 56 ventured to vote, and these, it must be remarked, were mainly lawyers!

The *Relief Church*, it will thus be seen, was founded simply on an assertion of the right of congregations to elect their own ministers. In 1758, Mr Thomas Boston, junior, minister of Jedburgh, and son of the great Boston, threw in his lot with Gillespie; in 1761, the congregation of Colinsburgh, in Fife, did the same. The Relief had now got a footing, and steadily increased. 'Societies' (as in the case of the Seceders) sprung up everywhere, which were gradually formed into congregations, and obtained ministers from the Establishment, the Secession, the Reformed Presbytery, and the English Presbyterians; nevertheless, they had long to sustain a severe fire of attack from the Seceders and Reformed Presbyterians, on account of their firm adherence to the latitudinarian principle of free

communion,' i. e., of holding Christian fellowship at the Lord's table with other denominations. It is unnecessary to prosecute the history of the Relief further than to state that at the union in 1847 it numbered 113 congregations; while the Secession numbered 384 congregations, so that the UNITED PRESBYTERIAN CHURCH commenced with 497 churches, and a membership estimated at more than 140,000.

UNITED PRESBYTERIAN CHURCH.—The career of this church as a corporate body has been one of uninterrupted prosperity, and scarcely more is necessary than to indicate its present attitude and condition. In point of doctrine, it adheres (like all the other Presbyterian churches of Scotland) to the Westminster Confession of Faith, and the Larger and Shorter Catechisms, 'it being always understood that we do not approve of anything in these documents which teaches, or may be supposed to teach, compulsory, or persecuting and intolerant principles in religion'—a qualification supposed to refer more particularly to the 23d chapter of the Confession of Faith. Its form of church government is Presbyterian; but, unlike the Established and Free Churches, it has no intermediate courts between presbyteries and the supreme court, the latter of which it does not call a General Assembly, but only a synod; though, in point of fact, it partakes more of the nature of a 'General' Assembly than the bodies known by that name, since it is really an assembly of the whole clergy of the denomination, with one elder from each kirk-session. It has a Theological Hall and Library in Edinburgh, and a staff of professors. The United Presbyterian Church is also at present, not only in *practice*, but also in *theory*, a voluntary church. The voluntary principle, it is true, is not formally laid down in any portion of her standards or 'Basis of Union,' for, as we have seen, neither the Secession nor the Relief was founded on this principle; but a long experience of practical voluntaryism has finally led, one may almost say, the whole body of United Presbyterians to the conviction that the interests of Christianity are best served by the total separation of the church from the state.

Although inferior in point of wealth to the Established and Free Churches, the United Presbyterian Church has honourably distinguished itself by the general liberality, and the occasional munificence, of its support of the various 'schemes' by which its rulers endeavour to make it an efficient agent in the maintenance and propagation of 'pure and undefiled religion.' In 1873, it had 611 churches, and 182,810 members.

UNITED PROVINCES. See NETHERLANDS (*History*).

UNITED STATES OF AMERICA, a federal republic, composed of 38 sovereign states and 11 territorial governments, occupying the temperate portion of North America, from lat. 24° 20′ to 49° north, and long. 66° 56′ 48″ to 124° 30′ west long.; bounded on the N. by British North America; E. by New Brunswick, the Atlantic Ocean, and the Gulf of Mexico; S. by the Gulf of Mexico and Mexico; and W. by the Pacific Ocean; also the outlying territory of Alaska (q. v.), extending from lat. 52° 2′ to 71° 27′ N., and from long. 130° 25′ to 187° 36′ W., forming the N.W. extremity of North America. Its greatest length, from the Atlantic to the Pacific, on the parallel of 42°, is 2768 miles, and its greatest breadth, from Point Isabel, Texas, to the N. boundary near Pembina, is 1601½ miles. The northern frontier is upward of 3350 miles in length, the Mexican 1500 miles. The ocean coast, including the larger indentation, is estimated at 12,609 miles, of which 6861 are on the Atlantic, 3461 on the Gulf of Mexico, 2281 in California, 8000, including bays and islands, on the border of Alaska, and 2000 on the Arctic Sea. Total area, 3,607,604 sq. miles or 2,308,866,560 acres.

This area has been obtained by successive annexations of territory, either by purchase, right of discovery, or conquest. In 1783, the territory ceded by Great Britain was confined to the country east of the Mississippi River, and north of Florida, having an area of 815,615 square miles. To this Louisiana was added by purchase from France in 1803, 930,928; Florida, ceded by Spain in 1821, 59,268; Texas, annexed in 1845, 247,356; Oregon, as settled by the treaty of 1846 (163,446 sq. m. having been yielded to Great Britain), 280,425; California, &c., conquered from Mexico, 1847, 649,762; New Mexico, &c., by treaty with Mexico, 1854, 27,500; and Alaska, by purchase from Russia, 1867, 577,390 sq. m.

The 38 states composing the federal republic, each having its constitution, legislature, executive, and judiciary, and represented in the Federal Council by two senators, and from one to thirty-three representatives, according to its population, together with the territories (in italics) not yet recognised as states, are the following: Sixteen Atlantic states and one district, Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, *District of Columbia*, Virginia, North Carolina, South Carolina, Georgia, and Florida: the 4 Gulf states, Alabama, Mississippi, Louisiana, and Texas: the 12 Mississippi valley states, Michigan, Wisconsin, Minnesota, Iowa, Ohio, Indiana, Illinois, Missouri, West Virginia, Kentucky, Tennessee, and Arkansas: the 4 states and territories of the Plains, *Dakota*, Nebraska, Kansas, *Indian*: the 8 Rocky Mountain states and territories, *Montana*, *Idaho*, *Wyoming*, Colorado, *Utah*, Nevada, *New Mexico*, and *Arizona*; and the 4 Pacific states and territories, *Washington*, Oregon, California, and *Alaska*. Eight of the above are organized territories under the control of Congress, their governors and judiciary being appointed by the President of the United States: they have a local legislature and send a delegate to Congress, who, however, has no vote therein. The remaining are known as the *Indian Territory*, which embodies a tract of land set apart by the government as a permanent home for several aboriginal tribes, mostly removed thither from east of the Mississippi, the territory of *Alaska*, and the *District of Columbia*. The District of Columbia originally embraced an area ten miles square situated on both sides of the Potomac, ceded to the United States by Maryland and Virginia and accepted in 1790 as a seat of government. The portion lying west of the Potomac was retroceded to Virginia in 1846 and the area was reduced to about 60 sq. m.

For full descriptions of these states and territories the reader is referred to the articles respectively.

The following table gives the dates of admission of the states to the Union and of the organization of territories, their area in square miles as officially estimated, their progressive population, and their population per sq. mile according to the U. S. census returns of 1880.

The Indians, or aborigines of the country, are not included in the summary of population. These are under the protection of the general government, and are scattered over the unsettled territories or gathered upon reserves.

In 1869 the number of Indians, as located under the various superintendencies, was 289,778. Of these the Washington superintendency contained 15,808; the Oregon, 10,975; Idaho, 6468; Montana, 13,903; Dakota, 28,318; Northern (Nebraska, &c.), 6489; the Central (Kansas, &c.), 19,340; Lake Superior and Green Bay Indians, 24,047; New York, 4991; California, 21,847; Nevada, 14,000; Utah, 12,800; Wyo

ming, 2400; Colorado, 7300; Arizona, 34,500; New Mexico, 21,162; Southern Superintendency, Creeks, Cherokees, &c., 45,430.

The states on this table designated as having been admitted from 1787 to 1790 were the original 13 states which at these dates adopted the Federal constitution. A part of the original Virginia now forms the state of West Virginia. Slavery was abolished on January 1, 1863, in the insurrectionary states, except Tennessee and part of Virginia and Louisiana, by proclamation of the President, and was abolished throughout the Union by an amendment to the Constitution adopted December 18, 1865.

No other country has been peopled by so many various races. New England was settled by English Puritans; New York by Dutch; Pennsylvania by Swedes, and by English and German Friends, or Quakers; Maryland by English Roman Catholics; Delaware and New Jersey by Dutch, Swedes, and English; Virginia by English Cavaliers; the Carolinas in part by French Huguenots; Louisiana and Michigan by French; Florida, Texas, and California by Spanish; Utah by Mormons, chiefly from England, Wales, and Denmark. More recently, immigration from Germany, Ireland, England, Sweden, Scotland, Switzerland, Denmark, Norway, &c., has been large and progressive. The aggregate number of immigrants during the four years ending June 30, 1874, was 1,499,298, or an average of 374,825 per annum. The number for the fiscal year 1873—1874 was 313,339, of whom 61,999 were from England, Wales, and Scotland, 53,707 from Ireland, 97,623 from Germany, Austria, and the Netherlands, 19,178 were Scandinavians, 21,694 were of the Latin races, 5755 Slavonic, 13,776 from China, 32,960 from British North America, &c. From 1847 to 1874 the total immigration amounted to 5,927,387. Two-thirds of the entire population of the U. S. are probably of foreign extraction or the result of modern immigration.

NOTE.—The total number of Indians was, in 1869, officially estimated to be about 300,000. The actual number out of tribal relations in 1880 is given as 66,107.

Physical Character.—Though occupying the central portion of a continent, more than two-thirds of the frontiers of the U. S. are shores of lakes and oceans, with numerous bays and sounds, rivers and lakes. On the Atlantic coast are—Passamaquoddy, Penobscot, Casco, and Massachusetts Bays, Long Island Sound, New York, Delaware, and Chesapeake Bays, Albemarle and Pamlico Sounds, &c.; on the Gulf of Mexico—Tampa, Appalachee, Pensacola, Mobile, Atchafalaya, Galveston, Matagorda, and Corpus Christi Bays, &c.; and on the Pacific—the channel of St Barbara,

Bay of Monterey, San Francisco Bay, Humboldt Harbour, Strait of Juan de Fuca, Puget's Sound, &c., and the numberless bays and sounds of Alaska. The principal lakes, besides those divided with British America, are Champlain, Michigan, Great Salt, Pyramid, Mono, Tulare, and many beautiful clusters of smaller lakes in Maine, New York, Minnesota, &c.

The rivers of the U. S. may be classed in four divisions: 1. The Mississippi and its branches (q. v.); 2. The rivers emptying into the Atlantic or its bays and sounds—the St Croix, Penobscot, Kennebec, Merrimac, Connecticut, Hudson, Delaware, Susquehanna, Potomac, James, Roanoke, Neuse, Cape Fear, Pedee, Santee, Savannah, Altamaha, St Johns, &c.; 3. Those, besides the Mississippi, emptying into the Gulf of Mexico—the Chattahoochee, Alabama, Tombigbee, Pearl, Sabine, Trinity, Brazos, Colorado, Nueces, and Rio Grande; 4. Those emptying into the Pacific—the Oregon or Columbia, Sacramento, San Joaquin, Colorado, &c. Besides these, there are many small rivers emptying into the great lakes, and finding their outlet through the St Lawrence, and the rivers which empty into the salt lakes of the great interior basin of Utah.

The chief mountains of America are those which belong to the great eastern chain of the Alleghanies (see APPALACHIAN) and the Rocky Mountains (q. v.).—The geology of the U. S. will be found described under the titles NORTH AMERICA (*Geology*), APPALACHIAN, ROCKY MOUNTAINS, and the several states and territories.—The soil is of every variety, from the dry alkaline tracts of the territories of the plains of Nevada and Utah, which need but abundant irrigation to render them highly productive, to the inexhaustibly fertile bottom-lands of the Mississippi Valley, where heavy crops of maize have grown for fifty successive years without manuring. The St Lawrence basin is an elevated plain, moderately fertile and well wooded. The Atlantic slope from Maine to New Jersey, east of the Hudson, is hilly, and best adapted for grazing; more southerly, the coast-belt is low, sandy, in places swampy, with pine-barrens, the inland region fertile, and among the best in the country. The Mississippi Valley is generally level, and prairie-land of unsurpassed fertility, with a rich mould, in places 25 feet deep. North-west, the country rises to a high and less fertile region, extending from 200 to 400 miles from the base of the Rocky Mountains. The Texas slope has rich bottom-lands, on the coast, a fine rolling fertile country, rising to a high plateau, dry and unproductive, except in the river bottoms. The Pacific slope is sometimes sterile, except in the great valleys between the mountain-ranges and bordering the rivers, which are of great fertility. Utah, with the exception of a few fertile spots, is an untimbered region of salt lakes, and land saturated with alkaline substances. The country east of the Mississippi, except the prairies of Illinois and Indiana, was at its settlement heavily wooded, and there are still vast forests of valuable timber—beech, birch, maple, oak, pine, hemlock, spruce, walnut, hickory, ash, elm, &c.; and in the south, live oak, water oak, magnolia, palmetto, tulip-tree, cypress, cotton-wood, cane, &c. West of the 97th meridian stretches a vast and almost treeless region; forests again occur in the Rocky Mountains, and California, Oregon, and Washington Territory have the largest timber in the world. The flora and fauna will be found under the heads NORTH AMERICA (*Botany*, *Zoology*), and the several states.

Climate.—For a particular account of the climate of the U. S., we refer to the articles RAIN and TERRESTRIAL TEMPERATURE. It is remarkable for wide transitions of cold and heat, rain and drought, except in the peninsula of Florida, where the temperature varies but 12° F., and Western Oregon and Washington Territory, where the climate is like that of England. With few exceptions, the summers are hot, both north and south, the thermometer rising at times to 108° F., and along the northern range of states sinking to —20°, and even sometimes as low as —40°. The whole Atlantic coast has a winter temperature 10° lower than that of Western Europe in the same latitude. Thus, at New York, in the latitude of Madrid, the Hudson River is frozen, and the harbour at times filled with floating ice. The causes modifying the climates of the different portions of the states chiefly arise out of the physical features; of which the Rocky Mountains, the Gulf of Mexico, the Atlantic, and the lake system in the north are the most prominent. On the west, from the shores of the Pacific to the Cascade Mountains, which border the ocean at a distance of about 120 miles, the climate resembles that of Great Britain more closely than that of any other country in the world, being mild and humid, with frequent showers at all seasons. But the great valley lying between the Cascade and the Rocky Mountains receives a diminished supply of rain, because the westerly winds are partially drained of their moisture in crossing the Cascade Mountains before arriving there. In winter the mountains are covered with snow, but in summer the highlands are arid. Owing, however, to the copious streams poured down from the melting snow, it presents abundant facilities for irrigation, so that its capabilities and resources will prove great, when properly developed. In the great basin of Utah and Nevada the mountain streams are lost in sands or are evaporated, leaving extensive flats covered with alkali, and in southern Utah and Arizona the streams flow through cañons of extraordinary depth and length. The country east of the Rocky Mountains depends for its rain on the Gulf of Mexico; and the rainfall there is distributed most in the low plains, and least on the plateaux and mountains. Hence over this extensive district southerly winds are warm and moist, and westerly and northerly dry and cold. The result is rapid alternations of temperature, such as are never experienced in Western Europe, frequently ranging in the course of a day 50° or 60°. In the New England states, the northerly and easterly winds are cold, moist, and chilly, accompanied with frequent fogs; but the summer temperature is delightful. The climate of the states surrounding the great lakes in the north is mild and moist in summer as compared with the other northern states; but in winter, on the western border of the lakes, a degree of cold is experienced greater, absolutely and relatively, than anywhere else in the states; on the eastern and southern borders the temperature is moderated. This excessive cold is caused by the country being exposed in the north to the full sweep of the polar current from the north; but more particularly to its low-lying situation, thus forming as it were a vast basin into which are poured from all sides the cold and therefore heavy currents of air chilled by terrestrial radiation during the winter season.—The health of the U. S. varies with climate, elevation, &c. Swamps and river-bottoms in some regions, especially the more fertile, are malarious. The rice swamps of Georgia and South Carolina are fatal to whites, but not to negroes. In vast tracts of new country, even the rolling and hilly, the disturbance of the soil causes intermittent fevers. Diseases of the lungs prevail in the northern and eastern states, bilious fevers in the southern; in the western, intermittent and remittent bilious. In 1850, the average mortality was 1 in 72, varying rather widely in different regions, modified not only by climate, but by the presence of large towns, and by immigration and emigration. The deaths in Vermont, a rural New England state, were

1 per cent.; in Florida, the most southerly, though increased by consumptive patients from the north, 1·06; Georgia, 1·09; Alabama, 1·18; Maine and Indiana, 1·30; Ohio and Texas, 1·46; Missouri, 1·50; Massachusetts, with numerous manufacturing towns, 1·95; Louisiana, with yellow fever, and a large floating unacclimated population, 2·31. Probably no portion of the world is more salubrious than the lower Rocky Mountain regions, and the eastern slope of the Alleghanies, Florida, the northern counties of the Gulf states, the head-waters of the Mississippi, California, and Oregon.

Mineralogy.—The U. S. are rich in mineral productions. Coal is found in every state except Maine, New Hampshire, Vermont, New Jersey, Delaware, South Carolina, Mississippi, Wisconsin, Minnesota, Nevada, and Louisiana. The area of the coal-measure is estimated at 250,000 sq. miles. The whole extent of the coal area in the U. S. has been divided into four principal coal-fields or tracts—viz., the Great Central Alleghanian or Appalachian coal-field, extending from Tuscaloosa in Alabama, through Eastern Tennessee and Kentucky, West Virginia, Maryland, Ohio, Pennsylvania, and reappearing in New Brunswick and Nova Scotia. This field has been computed to cover within the United States an area of 50,000 to 60,000 sq. m., of which about 40,000 sq. m. are considered workable area. A portion of this field in Pennsylvania produces anthracite. The second coal-field occupies the greater part of Illinois and Indiana, and in extent is nearly equal to the first. A third field covers a large portion of Missouri and Iowa; and the fourth the greater part of the state of Michigan. The Chesterfield bituminous coal-field, a detached district of small area near Richmond, Virginia, contains the oldest-worked collieries in America, and for many years furnished the only supply of coal for the seaboard towns. The product of Pennsylvania alone in 1870 was 14,626,338 tons of anthracite, and 7,000,000 tons of bituminous coal. From the petroleum springs of Pennsylvania, West Virginia, and Ohio 6,170,000 bbls. flowed in 1870. See NAPHTHA. Beds of green-sand marl are found in several of the Atlantic states, and in many, nitrates and carbonates of sodium and potassium, also gypsum, and marble of great variety and some of rare beauty. Iron is found everywhere, from the richest ores in mountain masses, to bog-ore; and in many places in close proximity to coal. Lead exists in rich deposits in Missouri, Arkansas, Illinois, and Iowa. Copper is found in several states, and in great quantities in ores of 71 to 90 per cent. on the borders of Lake Superior. Zinc exists in considerable quantities in Wisconsin, New Jersey, and Pennsylvania. Tin has been found in Maine and California. Silver is found in lead and copper, and in rich silver mines in New Mexico, Arizona, Nevada, California, and Utah. Gold is found in small quantities in the eastern states, in larger deposits in Virginia, North and South Carolina, and Georgia, and in great quantities in California, Oregon, Nevada, Colorado, Washington, Arizona, New Mexico, Idaho, and Montana. There are also found platina in small and mercury in large quantities in California, osmium and iridium in Oregon, cobalt in North Carolina and Missouri, and nickel in Connecticut and Pennsylvania.

Agriculture.—With an abundance of fertile land, agriculture holds the first place in the national industry. In 1870, 407,735,041 acres were occupied as farms, of which the cultivated land was 188,921,099 acres. According to the latest returns, the acreage of the principal crops is as follows: hay, 10,009,052; Indian corn, 34,091,137; wheat, 19,943,893; oats, 8,365,800; rye, 1,069,531; Irish potatoes, 1,200,912; buckwheat, 413,015; tobacco, 356,762; barley, 1,177,666. The other principal crops are sugar, rice, peas and beans, hemp, flax, &c., and the number of acres so improved is about as follows: rice, 175,000; hemp, 110,000; flax, 100,000; orchards, 500,000; gardens, 500,000; vineyards, 250,000; miscellaneous, 1,000,000. The average size of farms, nearly all held by their cultivators in fee-simple, is about 200 acres; in New England, about 100 acres; in the Southern States, 320 acres. The quantities of the chief agricultural productions in 1870 were—Indian corn, 760,944,549 bushels; wheat, 287,745,626; rye, 16,918,795; barley, 29,761,305; oats, 282,107,157; buckwheat, 9,821,721; potatoes (Irish), 143,337,443; (sweet), 21,709,824; hay, 27,316,048 tons; tobacco, 263,735,341 lbs.; cotton, 3,011,996 bales, the total estimated value of the farm productions being $2,447,538,658. In the years 1869—1870, 2,159,516 acres of the public land were sold for cash, mostly at the ordinary price of $1.25 an acre; 515,360 acres were bought with military warrants, and 3,698,910 acres were entered under the law of Congress which gives a homestead after five years' occupation; 192,848 were given to agricultural schools, 996,685 to railways, and 500,000 acres to the states in which they lie or for Indian reservations. Vast quantities of land have been impoverished and abandoned, but improved systems of agriculture, fostered by the government, for increasing scientific knowledge, have been widely introduced.

Wheat and maize are grown in all the states; cotton south of lat. 37°; cane-sugar in Louisiana, Texas, and Florida; hemp and tobacco, chiefly between lat. 34° and 40°; rice in South Carolina and Georgia; figs and oranges flourish in the Gulf States; and peaches, grapes, melons, and other delicious fruits are abundant and in great perfection in favoured districts south of lat. 43°.

Manufactures, Commerce, &c.—Manufactures, protected by high duties on foreign importations, have had a rapid development, as will be seen in the accounts of individual states. The census of 1870 gave the following aggregates for the year: pig iron, 2,052,821 tons; rolled iron, 1,500,000 tons; manufactories of cotton, 956, making goods to the value of $177,489,739; nearly 3000 woollen mills, using 154,767,095 lbs. of wool and 17,571,929 lbs. of cotton in mixed fabrics; leather in boots and shoes, harness, &c., value $54,191,167; flouring and gristmill products, $444,985,145; lumber sawed, $210,159,327; with large quantities of petroleum, spirits, India-rubber goods, paper, oil-cloth, carriages, agricultural instruments. The chief manufacturing states are Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, and Maryland. The whole number of manufacturing establishments, large and small, in the U. S., in 1870, was 252,148, employing a capital of $2,118,208,769; using raw material of the value of $2,488,427,242; and employing the labour of 1,615,598 males and 323,770 females, at a cost of $775,584,343, and producing manufactures valued at $4,232,325,442.

The foreign commerce of the U. S. in the official year ending June 30, 1874, amounted in gold value to $1,248,774,693, exports to $652,913,445, and imports to $595,861,248. The chief exports were cotton (unmanufactured), valued at $211,223,580; bread and breadstuffs, $161,198,864; gold and silver, $59,808,736; illuminating oil, $37,560,945; tobacco, $32,968,528; provisions, fish, &c., $77,649,523. The chief imports, sugar and molasses, $92,849,203; wool and woollen goods, $55,133,494; iron and steel and their manufactures, $33,793,546; coffee, $55,048,967; cotton goods, $28,193,869; silk goods, &c., $23,996,782; hides and skins, $16,444,877; tea, $21,112,234; tin, $16,245,471. Tonnage, June 1, 1874, 4,595,883, of which 1,116,425 tons were

steamboats.—Great facilities for internal commerce are given by free trade between all states and territories, and the great extent of navigable rivers, canals, and railways. The Mississippi and its branches afford 20,000 miles of steamboat navigation; and most of the rivers emptying into the Atlantic, Gulf of Mexico, and Pacific, are navigable from 100 to 500 miles; canals unite the waters of the Hudson river with Lakes Champlain, Ontario, and Erie in New York, the Delaware and Susquehanna rivers in Pennsylvania, the Ohio with Lake Erie in Ohio and Indiana, and the Mississippi with Lake Michigan in Illinois. Other canals make with these an extent of 3188 miles, costing $100,000,000. Railways extend from the lakes to the Gulf of Mexico, and from the Atlantic to the Pacific, of which there were, in 1874, 71,021 miles opened and 10,000 miles projected. There are also 85,583 miles of electric telegraph.

Education and Religion.—The benevolent, literary, and scientific institutions of the U. S. are generally state institutions or private, accounts of which will be found under the heads of the respective states. The exceptions are the Smithsonian Institution (q. v.), American Association for the Advancement of Science, and the National Academy of Sciences, and military and naval academies and hospitals.—In the U. S. are 360 colleges and collegiate institutions, 93 theological schools, 20 schools of law, 71 of medicine, 26 scientific, great numbers of academies or high schools, and female seminaries. Free common schools are established in nearly all the states, sufficient for universal education, supported by taxes and school-funds, and in all the new states, the reservation of one or two sections of land, of 640 acres each, in every township. There are 6 public libraries of over 100,000 volumes, 8 over 50,000, 16 over 30,000, and a great many lyceums, literary societies, and courses of popular lectures. In 1871 there were 6056 periodical publications issued in the U. S., 382 in Canada and the British colonies, a total of 6438; of which, 637 are daily; 118 tri-weekly; 129 semi-weekly; 4642 weekly; 21 bi-weekly; 829 monthly, semi-monthly, or bimonthly, &c.; and 62 quarterly. The total annual circulation of periodicals in the U. S. amounts to 1,436,551,538 or 38 copies for each inhabitant. The number of periodicals has been doubled within six years.

Religion is free from any interference of either the Federal or state governments, and all denominations exist in entire freedom upon the voluntary principle. There were, in 1870, 72,459 churches or places of worship, giving 560 seats to each 1000 of population. In 1860 the adherents of the Catholic Church were estimated at 3 millions, the Protestants at 25 millions. Of the 20 or more denominations of Protestants, the most numerous were the Methodists (1,650,217); after whom came Baptists (1,231,877), Presbyterians (654,240), Universalists (600,000), Disciples (Campbellites) (350,000), Congregationalists (289,110), Lutherans (260,135), Christian Connection (180,000), Episcopalians (150,593), United Brethren in Christ (102,583), German Reformed (100,691), Friends (94,000). There are 200,000 Jews, 60,000 Mormons, and many smaller sects.

Constitution, Government, &c.—The government of the United States is one of limited and specific power; strictly defined by a written constitution, framed by a convention of the states in 1787, which went into operation after being ratified by the thirteen original states in 1789, by which instrument the several states, having their independent republican governments, conferred upon a Federal Congress, executive, or President, and judiciary, such powers as were necessary to 'form a more perfect union, establish justice, insure domestic tranquillity, provide for the common defence, and secure the blessings of liberty.' The legislative powers granted to the Federal government are vested in a Congress of the United States, consisting of a Senate of two senators from each state, chosen by the legislature thereof; and a House of Representatives, consisting of one or more members from each state, elected by the people in equal electoral districts; so that the states, large and small, have each 2 votes in the Senate, and from 1 to 32 in the House of Representatives, which, in 1870, contained 243 members, but has been increased to 292, or 1 for every 133,000 of the population. The senator must be at least 30 years old, and is chosen for 6 years; the representative, at least 25 years old, and is elected for 2 years. Senators and representatives are paid $5000 per annum, and mileage at 20 cents a mile. The Senate is presided over by the Vice-president; and is a high court for trial of cases of impeachment. It also confirms the appointments of the President, and ratifies treaties made with foreign powers. Revenue bills originate in the House of Representatives. Bills passed by both Houses, within the limits of their constitutional powers, become laws, on receiving the sanction of the President; or, if returned with his veto, may be passed over it by two-thirds of both Houses.

By the constitution, the states granted to Congress power 'to lay and collect taxes, duties, imports, and excises, to pay the debts, and provide for the common defence and general welfare of the United States;' to borrow money; to regulate commerce; to establish uniform naturalisation and bankruptcy laws; to coin money, and fix the standards of weights and measures, and punish counterfeiting; to establish post-offices and post-roads; to secure patents and copyrights; punish piracies; declare war; raise armies and a navy; to call out the militia, reserving to the states to appoint their officers; and to govern the district of Columbia, and all places purchased for forts, arsenals &c., with the consent of the state legislatures. All powers not expressly granted are reserved to the states or the people; but the states, though sovereign and independent under the constitution, with all powers of local legislation, eminent domain (i. e., absolute possession of the soil), and power of life and death, with which neither President nor Congress can interfere, cannot make treaties, coin money, levy duties on imports, or exercise the powers granted to Congress.

The executive of the Federal government is a President, chosen by an electoral college, equal in number to the senators and representatives, elected by the people of the states. He must be a native of the United States, at least 35 years old, and is elected for a term of four years, and may be re-elected without limit. His salary is $50,000 a year. The Vice-president, who, in case of the death of the President, succeeds him, is President of the Senate. If he should die after becoming President, a new election by the people would be held. The President, by and with the consent of the Senate, appoints a cabinet, consisting of the Secretaries of State and Foreign Affairs, Treasury, War, Navy, Interior, the Postmaster-general, and Attorney-general. These officers have salaries of $8000 a year, have no seats in Congress, and are solely responsible to the President, who also appoints directly or through his subordinates, the officers of the army and navy—of which he is commander-in-chief—the justices of the Federal judiciary, revenue-officers, postmasters, &c.—in all about 100,000 persons.

The judiciary consists of a supreme court, with one chief-justice and seven associate justices, appointed by the President for life, and district judges in each district. The supreme court has jurisdiction in all cases arising under the constitution, laws, and treaties of the United States; causes affecting ambassadors and consuls, of admiralty and jurisdiction; controversies to which the United States is a party, or between a

state and the citizens of another state, citizens of different states, citizens and foreign states. It has original jurisdiction in state cases, or those affecting ambassadors or consuls—in others appellate. A person may be tried for treason, both against the Federal government and against the state of which he is a citizen. The President can reprieve or pardon a person condemned by a Federal court; but has no power to interfere with the judgment of state tribunals. Besides the supreme court, there are United States district courts, with judges, district attorneys, and marshals, in districts comprising part or whole of the several states. The citizens of each state are entitled to all privileges and immunities of the several states. Criminals escaping from one state to another are given up for trial on demand of the executive; and the constitution declares that 'no person held to service or labour in one state, under the laws thereof, escaping into another, shall, in consequence of any law or regulation therein, be discharged from such service or labour, but shall be delivered up on claim of the party to whom such service or labour may be due.' The constitution may be amended by a convention called at the request of two-thirds of the states; or amendments may be proposed by a vote of two-thirds of Congress, and ratified by two-thirds of the states; but 'no state, without its consent, shall be deprived of its equal suffrage in the Senate.'

The President, either directly, or through the Secretary of State and Foreign Affairs, appoints ministers, consuls, and consular agents to foreign countries. There are 13 envoys-extraordinary and ministers-plenipotentiary, receiving from $17,500 to $10,000 salary; 18 ministers resident, $10,000 to $4000. The consuls are paid by fees or salaries from $500 to $7500 per annum.

Revenue, Expenditure.—The following table will give a fair exhibit of the expenditures and debt of the United States during the last 25 years:

Year.	Civil List.	Military.	Naval.	Total Expenses.	Principal of Debt.
	Dollars.	Dollars.	Dollars.	Dollars.	Dollars.
1848	5,585,070	27,820,163	9,406,737	42,811,970	65,804,450
1850	14,839,725	12,801,764	7,923,313	43,002,168	64,228,238
1852	17,379,768	13,424,075	8,928,236	46,007,896	67,560,395
1854	25,907,372	14,342,684	10,768,192	51,018,248	44,975,456
1856	25,274,331	20,821,024	14,077,047	60,172,402	30,963,910
1858	26,387,822	31,537,307	13,976,001	71,901,130	44,910,778
1860	31,925,557	16,409,767	11,513,150	59,848,474	64,769,703
1862	24,511,476	394,368,707	42,674,569	461,554,752	511,826,274
1864	35,033,498	690,791,842	85,733,292	811,558,632	1,740,690,489
1865	735,125,497	1,030,690,400	122,617,434	1,906,433,331	2,680,647,869
1866	812,903,743	283,154,676	43,285,662	1,139,344,081	2,773,236,173
1868	920,877,820	123,246,648	25,775,502	1,069,899,970	2,611,687,851
1870	79,435,904	57,655,675	21,780,229	702,907,842	2,480,672,428
1872	96,579,889	35,372,157	21,249,810	153,201,856	2,253,251,328
1874	105,372,471	42,313,927	30,932,587	178,618,985	2,251,690,468

In 1860 the revenue from customs amounted to $53,187,512; lands, $1,778,557; other sources, $1,078,522,—total, $56,064,607. In 1874 the revenue from customs was $163,103,833; internal revenue, $102,409,784; lands, $1,852,428; premiums on sales of coin, $5,037,665; other sources, including direct tax, $49,782,521,—total revenue, $322,186,231. The expenditures for 1874 were, Indians, $6,692,462; pensions, $29,058,414; miscellaneous, $50,506,414; premiums on bonds purchased, $1,395,273; interest, $107,119,815. The following are some of the principal items of revenue for the years ending June 30, 1873 and 1874:

	1873.	1874.	Decrease.
Spirits	52,099,371	49,444,089	2,655,281
Tobacco	34,386,303	33,242,875	1,143,427
Fermented liquors	9,324,937	9,304,679	20,258
Banks and bankers	3,771,031	3,387,187	383,870
Penalties	461,653	364,216	97,436
Stamps	7,702,376	6,136,844	1,565,532
Back Taxes	6,329,782	764,880	5,564,901

The currency of the United States is a mixed one. A specie currency was for many years the only money recognised by the Federal government, but the exigences of the war of 1861—1865 compelled the government to issue large amounts of paper-money and to establish a system of national banks, now (1875) 2021 in number, issuing government paper, and having a circulation (Nov. 1, 1874) of $348,791,152. Of these banks 511, with a capital of $162,596,482 and a circulation of $109,705,018, are located in the Eastern States; 585, capital, $191,471,669, circulation, $123,052,872, in the Middle States; 215, capital, $46,392,500, circulation, $36,895,704, in the Southern and South-western States; 684, capital, $95,439,150, circulation, $77,174,850, in the Western States; and 26, capital, $2,475,325, circulation, $1,962,708, in the Pacific States and Territories. Also 7 gold banks are in operation in California, with a capital of $3,650,000, and a circulation of $2,150,000.

The specie currency of the United States consists of the gold dollar; the half-eagle, $5; the eagle, $10, the double eagle, $20; silver dollar, half-dollar, quarter; dime, 10 cents; half-dime; and nickel cent, or 100th part of a dollar. The official estimate of the amount of specie in the country June 30, 1874, was $166,846,228.49. The coinage for the year ending at that date was, gold, $50,442,690; silver, $5,983,601.30; minor coinage, $411,925—total $56,838,216.30.

Army and Navy.—The army of the United States, under the command of the President, consisted, in 1790, of 1260 men. In 1861, its numbers were 14,000, and those who took part with the Confederates, or were disbanded in the rebellious states, reduced the number to about 5000. April 15, 1861, 75,000 volunteers were called out; May 4, 64,000; July and December, 1861, 500,000; July 1, 1862, 300,000; August 4, 1862, 300,000; summer of 1863, 300,000; February 1, 1864, 500,000,—total, 2,039,748. On March 1, 1865, the aggregate was 965,591 men, which was augmented by enlistments, on May 1, to 1,000,576 of all arms, when orders for the disbandment were issued. On August 7, 640,806, and on November 15, 800,963 had been mustered out of service. This vast army was procured by volunteering, by enlistment in the regular army, and by drafts or conscriptions; but the greater part by bounties of $300 to $1000 to each volunteer. The regular army of the United States was reduced to the legal standard of 30,000 enlisted men on the 1st of July, 1871. The militia of the United States, organised under the state governments, numbers 3,245,193. There are numerous arsenals and manufactories of arms,—at Springfield (q. v.), Mass.; Pittsburg (q. v.), Penn., &c. The Military Academy at West Point, N. Y., educates cadets nominated from each state by members of Congress, and appointed by the President, who receive commissions as officers in the army. A Naval Academy has been established at Annapolis, Md., for the education of naval cadets.

For numbers and character of the United States navy, see NAVY, U. S., and MONITOR.

The Post-office Department, organised before the Revolution of 1775 by Benj. Franklin, had in the year ending June 30, 1870, 28,492 offices; 8861 routes, extending 231,232 m., including 43,727 m. of railway; its expenses were $23,998,837, and its revenue $19,772,220.

The Secretary of the Interior has charge of the survey and sale of the public lands of the United States, the Patent Office, Indian Office, Pension Office, Public Buildings, National Hospital for the Insane, Institution for Deaf and Dumb, Public Printing, and Education.

History.—The territories now occupied by the United States of America, though they were probably visited on their north-eastern coast by Norse navigators about the year 1000, continued the sole possession of numerous tribes of Indians (who had succeeded earlier and extinct races), until the discovery of

America by Columbus, 1492. In 1498, an English expedition, under the command of Sebastian Cabot, explored the eastern coast of America from Labrador to Virginia, perhaps to Florida. In 1513, Juan Ponce de Leon landed near St Augustine in Florida, and explored a portion of that region in a romantic search for the Fountain of Youth. In 1520, some Spanish vessels from St Domingo were driven upon the coast of Carolina. In 1521, by the conquests of Cortes and his followers, Mexico, including Texas, New Mexico, and California, became a province of Spain. In 1539—1542, Ferdinand de Soto led a Spanish expedition from the coast of Florida across Alabama, and discovered the Mississippi River. In 1584—1585, Sir Walter Raleigh sent two expeditions to the coast of North Carolina, and attempted to form settlements on Roanoke Island. A Spanish settlement was made at St Augustine, Florida, 1565. Jamestown, Virginia, was settled in 1607; New York, then called the New Netherlands, 1613; Plymouth, Massachusetts, 1620. A large part of the country on the great lakes and on the Mississippi was explored by La Salle in 1682; and settlements were made by the French at Kaskaskia and Arkansas Post, 1685; Mobile and Vincennes, 1702. The early history of the various colonies which now constitute the U. S. will be found under the heads of the different states and territories. The first effort at a union of colonies was in 1643, when the settlements in Massachusetts, New Hampshire, Rhode Island, and Connecticut formed a confederacy for mutual defence against the French, Dutch, and Indians, under the title of 'The United Colonies of New England.' They experienced the benefits of united action in 1754, when an English grant of lands to the Ohio Company brought on the French and Indian war—the French claiming, at that period, as the first explorers, Northern New England, half of New York, and the entire Mississippi Valley. George Washington was sent on his first expedition, to remonstrate with the French authorities; and the colonies being advised to unite for general defence, a plan for a general government of all the English colonies was drawn up by Benjamin Franklin; but it was rejected by both the colonies and the crown —by the colonies, who wished to preserve their separate independence, and by the crown from a jealousy of their united strength. The colonists, however, took an active part in the war. Under Major Washington, they joined General Braddock in his unfortunate expedition against Fort Du Quesne, now Pittsburg; they aided in the reduction of Louisburg, Ticonderoga, Crown Point, and Niagara; and rejoiced in the conquest of Quebec, by which the vast northern regions of America became the possessions of Great Britain.

The principles of a democratic or representative government were brought to America by the earliest colonists. The colonies themselves were founded by private adventure, with very little aid from government. The Plymouth colony was for 18 years a strict democracy, and afterwards a republic under a charter from the crown. A representative and popular government was established in Virginia in 1620. It was not until the Protectorate and the reign of Charles II. that the colonies were considered as portions of the empire, to be governed by parliament, when navigation acts were passed to give English ships a monopoly of commerce, when the produce of the colonies was required to be sent to England, and duties were levied on commodities sent from one colony to another. Protests were made against these assumptions; Virginia asserted her right of self-government; and it was not until the English revolution of 1688 that settled and uniform relations with the different colonies were established.

In 1713, by the treaty of Utrecht, England, which, since the reign of Elizabeth, had imported slaves from Africa into her American and West Indian colonies, obtained a monopoly of the slave-trade, engaging to furnish Spanish America, in 33 years, with 144,000 negroes. A great slave-trading company was formed in England, one quarter of the stock being taken by Queen Anne, and one-quarter by the king of Spain, these two sovereigns becoming the greatest slave-dealers in Christendom. By this monopoly, slavery was extended in, and to some extent forced upon, all the American colonies.

At this period, there was a general feeling of loyalty towards the mother country. The sons of the more wealthy colonists, especially in the south, were educated in England; English literature pervaded the colonies; the British throne was the fountain of honour; the colonies, though distinct, and differing in origin and character—Puritan in the East, Dutch Reformed in New York, Quaker in Pennsylvania, Catholic in Maryland, and Church of England in Virginia—were yet united by language, common ties, fears, and interests. In 1761, the enforcement of the Navigation Act against illegal traders, by general search-warrants, caused a strong excitement against the government, especially in Boston. The British Admiralty enforced the law; many vessels were seized; and the colonial trade with the West Indies was annihilated. In 1765, the passing of an act of parliament for collecting a colonial revenue by stamps caused general indignation, and led to riots. Patrick Henry, in the Virginia Assembly, denied the right of parliament to tax America, and eloquently asserted the dogma, 'no taxation without representation.' The first impulse was to unite against a common danger; and the first colonial congress of 28 delegates, representing 9 colonies, made a statement of grievances and a declaration of rights. The stamps were destroyed or reshipped to England, and popular societies were formed in the chief towns, called 'Sons of Liberty.' In 1766, the Stamp Act was repealed, to the general joy of the colonists; but the principle of colonial taxation was not abandoned; and in 1767, duties were levied on glass, paper, printers' colours, and tea. This renewed attempt produced, in 1768, riots in Boston, and Governor Gage was furnished with a military force of 700 to preserve order and enforce the laws. In 1773, the duties were repealed, excepting 3*d*. a pound on tea. It was now a question of principle, and from north to south it was determined that this tax should not be paid. Some cargoes were stored in damp warehouses and spoiled; some sent back; in Boston, a mob, disguised as Indians, threw it into the harbour. To punish this measure, parliament passed the Boston Port Bill, 1774, by which the chief town of New England was no longer a port of entry, and its trade transferred to Salem. The people were reduced to great distress, but received the sympathy of all the colonies, and liberal contributions of wheat from Virginia, and rice from Charleston, South Carolina.

It was now determined to enforce the government of the crown and parliament over the colonies; and a fleet, containing several ships of the line, and 10,000 troops, was sent to America; while the colonists, still asserting their loyalty, and with little or no thought of separation from the mother country, prepared to resist what they considered the unconstitutional assumptions of the government. Volunteers were drilling in every direction, and dépôts of provisions and military stores were being gathered. A small force being sent from Boston to seize one of these dépôts at Concord, Massachusetts, led to what is called the battle of Lexington, and

the beginning of the war of the Revolution, April 19, 1775. The British troops were attacked on their return by the provincials, and compelled to a hasty retreat. The news of this event summoned 20,000 men to the vicinity of Boston. The royal forts and arsenals of the colonies were taken possession of, with their arms and munitions. Crown Point and Ticonderoga, the principal northern fortifications, were surprised, and their artillery and stores appropriated. A Congress of the colonies assembled at Philadelphia, which resolved to raise and equip an army of 20,000 men, and appointed George Washington commander-in-chief. June 17, Bunker Hill, in Charleston, near Boston, where 1500 Americans had hastily intrenched themselves, was taken by assault by the British troops, but with so heavy a loss (1054) that the defeat had for the provincials the moral effect of a victory. After a winter of great privations, the British were compelled to evacuate Boston, carrying away in their fleet to Halifax 1500 loyal families.

The British government now put forth a strong effort to reduce the colonies to submission. An army of 55,000, including 17,000 German mercenaries ('Hessians'), was sent, under the command of Sir William Howe, to put down this 'wicked rebellion.' The provincial Congress, declaring that the royal authority had ceased, recommended to the several colonies to adopt 'such governments as might best conduce to the safety and happiness of the people;' and the thirteen colonies soon adopted constitutions as independent and sovereign states. On the 7th of June 1776, Richard Henry Lee, of Virginia, offered a resolution in Congress, declaring that 'the united colonies are, and ought to be, free and independent states; that they are absolved from all allegiance to the British crown; and that all political connection between them and the state of Great Britain is, and ought to be, totally dissolved.' This resolution, after an earnest debate, was adopted by the votes of 9 out of 13 colonies. A committee, consisting of Thomas Jefferson, John Adams, Benjamin Franklin, Roger Sherman, and Robert R. Livingston, was instructed to prepare a declaration in accordance with the above resolution; and the celebrated Declaration of Independence, written by Mr Jefferson, based upon the equality of men and the universal right of self-government, and asserting that 'all government derives its just powers from the consent of the governed,' on the 4th of July 1776, received the assent of the delegates of the colonies, which thus dissolved their allegiance to the British crown, and declared themselves free and independent states, under the general title of the thirteen United States of America—New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia—occupying a narrow line of the Atlantic coast between Canada and Florida, east of the Alleghanies, with a population of about 2,500,000.

After the evacuation of Boston, General Washington, with the remains of his army, thinned by the hardships of winter, hastened to New York. On the 2d of July, General Howe, being joined by his brother, Admiral Lord Howe, and Sir Henry Clinton, found himself at the head of 35,000 men; defeated the Americans on Long Island, August 27, 1776, compelled the evacuation of New York, and secured the possession of its spacious harbour, and the river Hudson. General Washington, with inferior and undisciplined forces, retreated across New Jersey, closely followed by the English, hoping to save Philadelphia. Newark, New Brunswick, Princeton, the chief towns in New Jersey, were taken, and the British awaited the freezing of the Delaware to occupy Philadelphia. On Christmas night, General Washington, by crossing in boats among floating ice, made a successful attack upon a Hessian force at Trenton, and a few days later at Princeton, and gave new courage to the desponding Americans, who recruited the army, and harassed the enemy with a winter campaign.

In the meantime, Silas Deane and Benjamin Franklin had been sent to France to solicit recognition and aid. The recognition was delayed, but important aid was privately given in money and supplies, and European volunteers—the Marquis de Lafayette, Baron Steuben, Baron de Kalb, Kosciusko, and Pulaski, rendering the most important services. Efforts were made to induce the British colonies of Canada and Nova Scotia to unite in the struggle for independence, and an expedition was sent against Montreal and Quebec, led by Generals Montgomery and Arnold. The Canadians refused their aid; Montgomery was killed, Arnold wounded, and the remains of the expedition returned after terrible sufferings. In 1777, after several severe actions in New Jersey, generally disastrous to the Americans, the British took possession of Philadelphia; and Washington, with the remnants of his army, went into winter-quarters at Valley Forge, where they suffered from cold, hunger, and nakedness.

While Washington was unsuccessfully contending against disciplined and overwhelming forces in New Jersey, General Burgoyne was leading an army of 7000 British and German troops, with a large force of Canadians and Indians, from Canada into Northern New York, to form a junction with the British on the Hudson, and separate New England from the rest of the rebel confederacy. His march was delayed by felled trees and destroyed roads; his foraging expeditions were defeated; and after two sharp actions at Stillwater and Saratoga, with but three days' rations left, he was compelled to capitulate, October 17; and England, in the midst of victories, heard with dismay of the loss of an entire army. The Americans gained 5000 muskets, and a large train of artillery. Feeling the need of more unity of action, articles of confederation, proposed by Franklin in 1775, were adopted in 1777, which constituted a league of friendship between the states, but not a government which had any powers of coercion.

In 1778, Lord Carlisle was sent to America by the British government with offers of conciliation, it was too late. France at the same time recognised American independence, and sent a large fleet and supplies of clothing, arms, and munitions of war to their aid; and General Clinton, who had superseded General Howe, finding his supplies at Philadelphia threatened, retreated to New York, having been defeated by the Americans at Monmouth.

The occasional successes of the British armies, the aid afforded by great numbers of Americans who still adhered to the royal cause and furnished during the war not less than 20,000 troops, and the alliance of large tribes of Indians, who committed cruel ravages in the frontier settlements, did little towards subjugating the country. Portions of the sea-coast of New England and Virginia were laid waste; but the king's troops were worn out with long marches and tedious campaigns, and even weakened by victories. Spain, and then Holland, joined in the war against England, and aided the Americans. Paul Jones, with ships fitted out in French harbours, fought desperate battles under the American flag on the English coast. But the king and parliament obstinately persisted in the vain attempt to preserve the integrity of the empire.

In 1780, 85,000 seamen were raised, and 35,000 additional troops sent to America, and a strong effort was made to subjugate the Carolinas, where the war became of a bitter partisan character, and was conducted with spirit by Sumpter, Marion, and other Southern chieftains. Lord Cornwallis, with a large army, marched from Charleston, through North Carolina, pursuing, and sometimes defeating, the American General Gates, but suffered defeat at King's Mountain, in North Carolina, at Cowpens, in South Carolina, and at Eutaw Springs, which nearly closed the war in the South. In the mean time, Admiral de Varney had arrived upon the coast with a powerful French fleet, and 6000 soldiers of the élite of the French army, under Count de Rochambeau. Cornwallis was obliged to fortify himself at Yorktown, blockaded by the fleet of Count de Grasse, and besieged by the allied army of French and Americans, waiting for Sir Henry Clinton to send him relief from New York. October 19, 1781, he was compelled to surrender his army of 7000 men—an event which produced such a change of feeling in England as to cause the resignation of the ministry, and the despatch of General Sir Guy Carleton to New York with offers of terms of peace. The preliminaries were signed at Paris, November 30, 1782; and on September 3, 1783, peace was concluded between England and France, Holland, and America. The independence of each of the several states was acknowledged, with a liberal settlement of territorial boundaries. In April, a cessation of hostilities had been proclaimed, and the American army disbanded; New York, which had been held by the English through the whole war, was evacuated November 25; and on December 4, General Washington took leave of his companions in arms, and on December 23 resigned into the hands of Congress his commission as commander.

From the retreat of Lexington, April 19, 1775, to the surrender of Yorktown, October 19, 1781, in 24 engagements, including the surrender of two armies, the British losses in the field were not less than 25,000 men, while those of the Americans were about 8000.

The states were free, but exhausted, with a foreign debt of $8,000,000, a domestic debt of $30,000,000, an army unpaid and discontented, a paper-currency utterly worthless, and a bankrupt treasury. The states were called upon to pay their shares of the necessary expenditures, but they were also in debt, and there was no power to compel them to pay, or to raise money by taxation. In these difficulties, and the failure of the articles of confederation, a convention was summoned by Congress in 1787, to revise these articles. The task was so difficult, that the Convention resolved to propose an entirely new constitution, granting fuller powers to a Federal Congress and executive, and one which should act upon the people individually as well as upon the states. The constitution was therefore framed, whose provisions have already been stated, and which is still the basis of the government; and though strongly opposed by many, who believed that the extensive powers granted by it to Congress and the executive would be dangerous to the liberties of the people, it was, in 1787—1788, adopted, in some cases by small majorities, in 11 state conventions, and finally by the whole 13 states, chiefly through the exertions and writings of James Madison, John Jay, and Alexander Hamilton. Virginia ratified the constitution with the declaration, that she was at liberty to withdraw from the union whenever its powers were used for oppression; and New York, after Hamilton had declared that no state could ever be coerced by an armed force. The country was at this period divided into two parties: the Federalists, who were in favour of a strong centralised government, and the Anti-federalists, who held to the sovereignty and rights of the independent states. George Washington and John Adams, standing at the head of the Federalist party, were elected President and Vice-president of the United States. The President took the oath to support the constitution in front of the City Hall in New York; and the government was organised with Thomas Jefferson, Secretary of State; Alexander Hamilton, Secretary of the Treasury; General Knox, Secretary of War; and John Jay, Chief Justice of the supreme court. Congress assumed the war-debts of the several states, and chartered the bank of the United States, though its constitutional right to do so was strenuously denied by the Republican or States' Rights party. Washington was re-elected to the presidency in 1792; but party-spirit increased, excited by the events of the French Revolution. Citizen Genet, who represented the French Republic in America, fitted out privateers against England, and his recall was demanded by the President. The Federalists took the side of England in the great European contest, while the Republicans sympathised with the Revolution. There grew up also difficulties between the English and American governments. The Americans accused the English of carrying off large numbers of negroes and other property at the close of the war; while the English accused the Americans of sequestrating the property of loyalists, which they had engaged by treaty to restore to them. These controversies were happily settled by Mr Jay.

In 1796, Washington, worn and irritated by partisan conflicts and criticisms, refused a third election, and issued his farewell address to the people of the U. S., warning them against the dangers of party-spirit and disunion, and giving them advice worthy of one who was said to be 'first in war, first in peace, and first in the hearts of his countrymen.' John Adams was elected President; and Thomas Jefferson, the second choice of the people for the presidency, became, according to the rule at first adopted, Vice-president. In 1798, the commercial regulations of France, and the assertion of the right to search and capture American vessels, nearly led to a war between the two republics. In 1799, the nation, without distinction of party, mourned the death of Washington; and, in the following year, the seat of government was removed to the city he had planned for a capital, and which bears his name. The partiality of Mr Adams for England, the establishment of a Federal army, and the passage of the Alien and Sedition Laws, by which foreigners could be summarily banished, and abuse of the government, by speech or the press, punished, caused great political excitement, and such an increase of the Republican, or, as it was afterwards called, the Democratic party, that the President failed of a re-election in 1801; and there being no election by the people, the House of Representatives, after thirty-six ballotings, chose Thomas Jefferson, the Republican candidate, with Aaron Burr for Vice-president; and the offices of the country were transferred to the victorious party. Internal duties, which a few years before had led to an insurrection in Pennsylvania called the Whisky Insurrection, were abolished, and the Alien and Sedition Laws repealed. Tennessee, Kentucky, Vermont, and Ohio had now been organized as states, and admitted into the Union. In 1803, the area of the country was more than doubled by the purchase of Louisiana—the whole region between the Mississippi and Rocky Mountains—from France for 60,000,000 francs. The infant navy waged a successful

war with Tripoli. In 1805, Mr Jefferson was elected for a second term; but Mr Burr, having lost the confidence of his party, engaged in a conspiracy to seize upon the Mississippi Valley, and found a new empire, with its capital at New Orleans. He was tried for treason, but not convicted. The commerce of America was highly prosperous, her ships enjoying much of the carrying-trade of Europe; but, in May 1806, England declared a blockade from Brest to the Elbe, and Bonaparte, in November, decreed the blockade of the coasts of the United Kingdom. American vessels were captured by both parties, and were searched by British ships for British subjects; and those suspected of having been born on British soil, were, in accordance with the doctrine, once a subject always a subject, impressed into the naval service. Even American men-of-war were not excepted from this process. The British frigate *Leopard* meeting the American frigate *Chesapeake*, demanded four of her men, and on refusal, fired into her, and the surprised *Chesapeake* struck her flag. British ships were hereupon forbidden U. S. harbours.

Mr Jefferson, following the example of Washington, declined a third election; and, in 1809, James Madison became President. The French decrees, prejudicial to neutral commerce, were revoked in 1810; but the English continued, a source of loss and irritation, while hundreds of American citizens were in forced service in British vessels. The feeling was increased by a night-encounter between the American frigate *President* and the British sloop-of-war *Little Belt*, May 16, 1811. In April 1812, an embargo was again declared by Congress, preparatory to a declaration of war against Great Britain, July 19, for which Congress voted to raise 25,000 enlisted soldiers, 50,000 volunteers, and 100,000 militia. General Hull, with 2000 men at Detroit, invaded Canada; but on being met by a small force of British and Indians, under General Brock, recrossed the river, and made a shameful surrender; and was sentenced to death for his cowardice, but pardoned by the President. A second invasion of Canada was made near Niagara Falls by General Van Rensselaer. One thousand American militia stormed the heights of Queenstown, and the British general, Brock, was killed; but reinforcements arriving opportunely, the heights were retaken, and nearly all the Americans were killed or driven into the Niagara, while the American general was in vain imploring a large body of militia on the opposite bank to cross over to the support of their brethren in arms. They refused, upon the ground, that the government had no constitutional right to send the militia across the frontier. The Federal party, opposed to the war, defended this doctrine, and General Van Rensselaer resigned in disgust. American disasters on the land were, however, compensated by victories at sea. August 19, the U. S. frigate *Constitution* captured the British frigate *Guerrière;* October 18, the *Wasp* took the *Frolic;* October 25, the frigate *United States* captured the *Macedonian;* December 29, the *Constitution* took the *Java.* The Americans in most cases had the larger ships and heavier ordnance; but the immense disparity in losses shewed also superior seamanship and gunnery. American privateers took 300 British vessels and 3000 prisoners. In 1813, General Proctor crossed the Detroit river with a considerable force of British and Indians, and defeated General Winchester, with the usual results of savage warfare. In April, an American army of 1700 men captured York (now Toronto), and about the same time another American force of 800 men was defeated with great loss by the Indians under Tecumseh; but the remainder of this campaign was wholly favourable to the Americans. The attempt of the British general, Prevost, on Sackett's Harbor was repulsed; the squadron on Lake Erie, consisting of 6 vessels, 63 guns, was captured by Commodore Perry at the head of an American flotilla of 9 vessels, 54 guns; and this latter success enabled General Harrison to invade Canada, where he defeated General Proctor in the battle of the Thames, in which the great Indian warrior-chief Tecumseh was killed. In 1813, another invasion of Canada was attempted; and York (now Toronto) was taken by General Dearborn; and an unsuccessful attempt was made to take Montreal. Villages were burned on both sides. The British also destroyed American shipping in Delaware Bay. At the same period, General Jackson defeated the Creek Indians in Alabama and Georgia, who had been excited to make war upon the frontier settlements.

In 1814, Generals Scott and Ripley crossed the Niagara, and sharp actions, with no decisive results, were fought at Chippewa and Lundy's Lane, close by the great Cataract. General Wilkinson also invaded Canada on the Sorell river, but was easily repulsed. A British invasion, by Lake Champlain, by General Sir George Prevost, with 14,000 men and a flotilla on the lake, was no more successful. On the 6th of September, the flotilla was captured by Com. Macdonough in the harbour of Plattsburg, while the army was repulsed on shore, and retreated with heavy loss. In August, a British fleet ascended Chesapeake Bay, took Washington with but slight resistance, and burned the government buildings. A subsequent attack on Baltimore was unsuccessful. New York, New London, and Boston were blockaded, and a large expedition was sent against Mobile and New Orleans. On the 8th of January 1815, General Packenham advanced with 12,000 men against the latter city, which was defended by General Jackson, at the head of 6000 militia, chiefly from Tennessee and Kentucky, aided by a small force of artillery, recruited from the Barataria pirates. The Americans were sheltered by a breastwork, and the British assault was met with so deadly a fire of riflemen, that it was repulsed, with the loss of General Packenham and several officers, with 700 killed and 1000 wounded; while the entire American loss is stated to have only amounted to 71. This ill-planned and unfortunate action was fought more than a month after peace had been concluded between England and America, and was followed by two naval actions in February and March. Though during this contest fortune at first favoured the Americans on the high seas, she changed sides completely from June 1813, as if to counterbalance the disasters of the British on land. June 1, the *Chesapeake* was taken by the *Shannon*; June 3, the *Growler* and *Eagle* were captured by British gun-boats; the *Argus* was taken by the *Pelican*, August 14; the *Essex* by the *Phœbe* and *Cherub*, March 29, 1814; the *President* by the *Endymion*, January 15, 1815; the only counterbalancing success being the sinking of the British sloop *Avon* by the *Wasp*, September 8, 1814. In December 1814, the Federalists of New England held a convention at Hartford in opposition to the war and the administration, and threatened a secession of the New England states. See Hartford Convention. In 1815, Commodore Decatur, who had taken a distinguished part in the recent war, commanded an expedition against the Algerians—whose corsairs had preyed on American commerce in the Mediterranean—and dictated terms to Algiers, Tunis, and Tripoli.

The Democratic Republican party having brought the war to a satisfactory conclusion, the Federalists disappeared; and in 1817, James Monroe was elected

to the presidency, almost without opposition, in what was termed 'the era of good feeling.' A rapid emigration from Europe and from the Atlantic states to the richer lands of the West, had in ten years added six new states to the Union. Difficulties arose with the warlike southern Indian tribes, whose hunting-grounds were invaded; and General Jackson, sent against the Seminoles, summoned to his aid the Tennessee volunteers who had served under him against the Creeks and at New Orleans, defeated them, pursued them into Florida, took Pensacola, and banished the Spanish authorities and troops. He was, however, supported in these high-handed measures by the President; and in 1819, Florida was ceded by Spain to the United States. In 1819—20, Alabama and Maine, a slave and a free state, were added to the Union; and the question of the admission of Missouri arose in Congress—the question of its admission with or without slavery. At the period of the Revolution, slavery existed in all the states except Massachusetts; but it had gradually been abolished in the northern and middle states, except Delaware, and excluded from the new states between the Ohio and Mississippi by the terms on which the territory had been surrendered by Virginia to the Union. Under the constitution, slaves were not counted in full as a represented population; but by a compromise, three-fifths of their numbers were added to the whites. The slave states were almost exclusively agricultural, with free-trade interests. The free states were encouraging manufactures by protection. The two sections had already entered upon a struggle to maintain the balance of power against each other. After an excited contest, Missouri was admitted, with a compromise resolution, that in future no slave state should be erected north of the parallel of 36° 30′ N. lat.—the northern boundary of Arkansas. During the second term of Mr Monroe, in 1824, General Lafayette visited America, and was everywhere received with great enthusiasm. In the presidential election of 1824, there were four candidates—John Quincy Adams, Andrew Jackson, Henry Clay, and William H. Crawford. There being no choice by the people, the House of Representatives chose Mr Adams; John C. Calhoun being elected Vice-president. Party and sectional feeling became stronger. Mr Adams and Mr Clay, who had heretofore acted with the party of Jefferson and Madison, were henceforth identified with what was called the National Republican, and later, the Whig, and finally, in union with the Anti-slavery party, the Republican party. In 1826, two of the founders of the republic, John Adams and Thomas Jefferson, died on the 4th of July, the anniversary of the Declaration of Independence—an event which made a profound impression. The four years of Mr Adams, during which there were violent contests on protection and the powers of the Federal government to carry out public works within the states, ended with an excited election contest, which resulted in the triumph of the Democratic party and the election of Andrew Jackson, with John C. Calhoun as Vice-president. The bold, decisive, and impetuous character of General Jackson was shewn in a general removal of those who held office, down to small postmasters and tide-waiters, under the late administration, and the appointment of his own partisans. An act for the rechartering of the U. S. Bank was met by a veto of the President, who declared it unconstitutional and dangerous. In 1832, an Indian war, called the Black Hawk War, broke out in Wisconsin; but the passing of a high protective tariff act by Congress caused a more serious trouble. The state of South Carolina declared the act unconstitutional, and therefore null and void, threatening to withdraw from the Union if an attempt were made to collect the duties on foreign importations. The President prepared to execute the laws by force; Mr Calhoun resigned his office of Vice-president, and asserted the doctrine of state-rights, including the right of secession, in the Senate. A collision seemed imminent, when the affair was settled by a compromise bill, introduced by Henry Clay, providing for a gradual reduction of duties, until 1843, when they should not exceed 20 per cent. *ad valorem.*

The popularity of General Jackson caused his re-election by an overwhelming majority against Henry Clay, the leader of the Bank, Protection, and Internal Improvement party; and he entered upon his second term with Martin Van Buren of New York as Vice-president. The removal of the government deposits from the U. S. Bank to certain state banks, led to the failure of the bank, and after some years, to the adoption of Mr Van Buren's plan of an independent treasury. The Cherokee Indians in Georgia, who had attained to a certain degree of civilisation, appealed to the President for protection against the seizure of their lands by the state; but they were told that he 'had no power to oppose the exercise of the sovereignty of any state over all who may be within its limits;' and the Indians were obliged to remove to the territory set apart for them west of the Mississippi. In 1835, the Seminole war broke out in Florida; and a tribe of Indians, insignificant in numbers, under the crafty leadership of Osceola (q. v.), kept up hostilities for years, at a cost to the U. S. of several thousands of men and some fifty millions of dollars. In 1837, Martin Van Buren succeeded General Jackson in the presidency. His term of four years was a stormy one, from the great financial crisis of 1837, which followed a period of currency-expansion and wild speculation. All the banks suspended payment, and the great commercial cities threatened insurrection. Mr Van Buren was firm in adhering to his principle of collecting the revenues of the government in specie, and separating the government from all connection with the banks. His firmness in acting against the strong sympathies of the northern and western states with the Canadian insurrection of 1837—1838, also damaged his popularity; and in 1840, the election of General Harrison, with John Tyler for Vice-president, was one of unexampled excitement, characterised by immense popular gatherings, political songs, the use of symbols, and the participation of both sexes to a degree hitherto unknown in America. The Whigs triumphed in nearly every state; General Harrison was inaugurated March 4, 1841; and the rush to Washington for offices was as great as the election had been exciting and remarkable. Worn down with the campaign and the office-seekers, General Harrison died in a month after his inauguration, and was succeeded by John Tyler, who, having been a Democrat, was no sooner in power than he seems to have reverted to his former political principles. He vetoed a bill for the establishment of a national bank and other measures of the party by which he had been elected. His cabinet resigned, with the exception of Daniel Webster, Secretary of State, and others, Democratic or neutral, were appointed in their place. During Mr Tyler's administration, the north-eastern boundary question, which nearly occasioned a war with England, was settled by Mr Webster and Lord Ashburton; a difficulty amounting almost to a rebellion, was settled in Rhode Island; but the most important question agitated was that of the annexation of Texas. This annexation was advocated by the South, as a large addition to southern and slave territory; and, for the same reason

opposed by the Whig and anti-slavery parties of the North. Besides, the independence of Texas, though acknowledged by the U. S., England, and France, had not been acknowledged by Mexico, and its annexation would be a *casus belli* with that power. The recent admissions of Iowa and Florida into the Union had kept the balance of power even between North and South, but Texas would be an advantage to the South. But the gain of territory, and a contempt for Mexico, overcame these objections, and in 1845, Texas was formally annexed to the U. S.; and James K. Polk of Tennessee succeeded Mr Tyler in the presidency.

M. Almonte, the Mexican minister at Washington, protested against the annexation of Texas, as an act of warlike aggression; and to guard against a threatened invasion of Texas, General Zachary Taylor was ordered, with the U. S. troops of his military district, to its southern frontier. The Mexicans crossed the Rio Grande, and commenced hostilities, April 26, 1845. In March 1846, General Taylor moved forward, and won the victories of Palo Alto, Resaca de la Palma, Monterey, Saltillo, and finally, against great odds—20,000 to 4759—in Feb. 1847, the hard-fought battle of Buena Vista, a victory that excited great enthusiasm. In the meantime, General Wool had been sent on an expedition to Chihuahua, in Northern Mexico; General Kearney to New Mexico; and Captain Fremont and Commodore Stockton took possession of California. March 9, 1847, General Scott landed at Vera Cruz, which he took on the 29th, after a siege and bombardment by land and water. Marching into the interior with a force of about 9000 men, he found General Santa Anna intrenched on the heights of Cerro Gordo with 15,000 men. On April 18, every position was taken by storm, with 3000 prisoners, 43 cannon, 5000 stand of arms, &c. Waiting at Puebla for reinforcements until August, General Scott advanced with 11,000 men towards Mexico, near which General Santa Anna awaited him with large forces and in strong positions. On the 19th and 20th of August were fought the battles of Contreras and Churubusco, in which 9000 Americans vanquished an army of over 30,000 Mexicans in strongly fortified positions. After a brief armistice, hostilities recommenced on the 7th September; and after a series of sanguinary actions, the American army, reduced to about 8000, entered the city of Mexico, which ended the war. By the treaty of Guadalupe, the U. S. obtained the cession of New Mexico and Upper California, the U. S. paying Mexico $15,000,000, and assuming the payment of the claims of American citizens against Mexico. The opposition to the annexation of Texas, and to the war and the acquisition of the newly-acquired territory, became now complicated and intensified by sectional feelings and the opposition to slavery. The Northern party demanded that slavery should never be introduced into territories where it had not existed; the South claimed the right of her people to emigrate into the new territories, carrying with them their domestic institutions. During the debates on the acquisition of the Mexican territories, Mr Wilmot of Pennsylvania introduced an amendment, called the 'Wilmot Proviso,' providing that there should be neither slavery nor involuntary servitude in the acquired territory. This was voted down, but became a party principle. In 1849, General Taylor, the 'Rough and Ready' victor of Buena Vista, became President, with Millard Fillmore as Vice-president. The Free-soil party * had nominated Martin Van Buren, with Charles Francis Adams for Vice-president; the Democratic candidate being General Lewis Cass. The Liberty party in 1840 had cast 7609 votes; in 1844, it had 62,300, Mr Van Buren in 1848 received 291,263, so rapid was the growth of a party soon destined to control the policy of the government. September 1, 1849, California, rapidly peopled by the discovery of gold, adopted a constitution which prohibited slavery. Violent struggles and debates in Congress followed, with threats of secession, and protests against interference with slavery. The more zealous abolitionists of the North denounced the constitution for its support of slavery, and its requirement of the return of fugitive slaves to their owners, and threatened separation. The South denounced the violation of the constitution by interference with slavery—a domestic institution of the states—the carrying off of negroes secretly by organised societies, and what was termed the 'Underground Railway,' and the passage of personal liberty bills in several states, which virtually defeated the requirements and guarantees of the Fugitive Slave Law. Mr Clay introduced a compromise into Congress, admitting California as a free state, and introducing a new and more stringent law for the rendition of fugitive slaves. President Taylor, more used to the rough life of a frontier soldier than the cares of state, died July 9, 1850, and was succeeded by Mr Fillmore.

The election of Franklin Pierce in 1852, against General Scott, was a triumph of the Democratic, States' Rights, and Southern party. Jefferson Davis, a senator from Mississippi, a son-in-law of General Taylor, and who had served under him in Mexico, was appointed Secretary of War. New elements were added to the sectional controversies which agitated the country by the repeal of the Missouri Compromise, and the passage of the Kansas-Nebraska bill of Senator Douglas, which left the people of every territory, on becoming a state, free to adopt or exclude the institution of slavery. The struggles of Kansas, approaching a civil war between the Free-soil and Pro-slavery parties in that rapidly growing territory, resulted in the exclusion of slavery. A brutal assault upon Mr Sumner, senator from Massachusetts, by a Southerner, named Preston Brooks, in consequence of a violent speech on Southern men and institutions, increased the excitement of both sections. The formation of an Anti-foreign and No-popery party, called the 'Know-nothing' party, acting chiefly through secret societies, was a singular but not very important episode in American politics, though it may have influenced the succeeding election.

In 1856, the Republicans, composed of the Northern, Free-soil, and Abolition parties, nominated John C. Fremont for the presidency, while the Democratic and States' Rights party nominated James Buchanan. Ex-president Fillmore received the Know-nothing nomination. The popular vote was—for Buchanan, 1,838,169; Fremont, 1,341,264, Fillmore, 874,534. Mr Buchanan was inaugurated March 4, 1857, with John C. Breckinridge, afterwards a general of the Confederate army, as Vice-president. A difficulty with the Mormons, which caused the President to send a military force to Utah, was settled without bloodshed. The efforts of the government to execute the Fugitive Slave Law kept up an irritated feeling. There were savage fights between the northern and southern parties in Kansas, and on the western borders of Missouri. Resolute and well-armed settlers were sent out by New England emigration societies. In October 1859, John Brown, known in Kansas as 'Ossawattamie Brown,' who, with his sons, had been engaged

* The Free-soil party opposed the extension of slavery by the admission of new slave states, while recognising its legal and constitutional existence where already established.

in the struggles in Kansas, planned and led an expedition for freeing the negroes in Virginia. He made his attempt a. Harper's Ferry, on the Potomac, where, after a vain attempt to induce the negroes to join him, he and his small party took possession of one of the government workshops, where he was taken prisoner by a party of U. S. soldiers, and handed over to the authorities of Virginia, tried and executed, December 2. His body was taken to his home in New York for burial, and he was regarded by the Abolition party as a martyr.

In 1860, the Democratic party, which, except at short intervals, had controlled the Federal government from the election of Jefferson in 1800, became hopelessly divided. The Southern delegates withdrew from the convention at Charleston, and two Democratic candidates were nominated, Stephen A. Douglas of Illinois, and John C. Breckinridge of Kentucky; while the Republicans, or united Whig and Abolition party, nominated Abraham Lincoln of Illinois; and the Union or American Party nominated John Bell of Tennessee. The Republican convention adopted a moderate and even a conservative 'platform' of principles, denounced the John Brown raid, and put forward as a principle, 'the maintenance inviolate of the rights of the states, and especially the right of each state to order and control its own domestic institutions according to its own judgment exclusively.' Still, the country was sectionally divided, and all who had laboured to limit and destroy the Southern institution of slavery were acting with the Republican party.

At the election of November 1860, Mr Lincoln received every Northern vote in the electoral college, excepting three of New Jersey, which were given to Mr Douglas, 180 votes; Mr Breckinridge received 72 electoral votes; Mr Bell, 39; Mr Douglas, 12. The North and South were arrayed against each other, and the South was beaten. Of the popular vote, Mr Lincoln received 1,857,610; Mr Douglas, 1,365,976; Mr Breckinridge, 847,951; Mr Bell, 590,631. Thus, while Mr Lincoln gained an overwhelming majority of the electoral votes given by each state, the combined Democratic votes exceeded his by 356,317, and the whole popular vote against him exceeded his own by 946,948. A small majority, or even plurality, in the Northern states was sufficient to elect him.

The South lost no time in acting upon what her statesmen had declared would be the signal of their withdrawal from the Union. On the 10th of November, as soon as the result was known, the legislature of South Carolina ordered a state convention, which assembled December 17, and on the 20th unanimously declared that 'the union now subsisting between South Carolina and other states, under the name of the United States, is hereby dissolved;' giving as a reason that 14 of these states had for years refused to fulfil their constitutional obligations. The example of South Carolina was followed by Mississippi, January 9, 1861; Florida, 10th; Alabama, 11th; Georgia, 19th; Louisiana, 26th; Texas, Feb. 1; Virginia, April 25; Arkansas, May 6; North Carolina, 21st; Tennessee, June 8. Kentucky and Missouri were divided, and had representatives in the governments and armies of both sections.

On the 4th of February 1861, delegates from the seven then seceded states met at Montgomery, Alabama, and formed a provisional government, under the title of the 'Confederate States of America.' A constitution was adopted much like that of the U. S., and the government fully organised, February 13, 1861; President, Jefferson Davis of Mississippi; Vice-president, Alexander H. Stephens of Georgia; and, May 24, established at Richmond, Virginia. The secession movement appears to have been nearly unanimous in the more Southern states, and to have been carried by more or less decided majorities. As state after state withdrew from the Union, its senators and representatives in Congress at Washington resigned their seats; and nearly all the officers of the army and navy, of Southern birth, believing that their first and final allegiance was due to their states, and that the action of each state carried with it all its citizens, also resigned their commissions, and tendered their swords to their respective states, and to the Confederacy they ha formed.

President Buchanan, doubting his constitutional power to compel the seceding states to return to the Union, made a feeble and ineffectual attempt to relieve the garrison of Fort Sumter, in Charleston harbour, closely besieged by the forces of South Carolina. Commissioners were sent to Washington to negotiate for the settlement of the claims of the Federal government, and great efforts were made to effect compromises of the difficulties, but without result.

On the 4th of March 1861, President Lincoln was inaugurated at Washington. In his address, he said: 'I have no purpose, directly or indirectly, to interfere with the institution of slavery in the states where it exists. I believe that I have no lawful right to do so, and I have no inclination to do so.' On the 7th of April, a naval expedition set sail from New York for the relief of Fort Sumter; and its arrival off Charleston Harbour was the signal for the commencement of a bombardment of the fort by the Confederate batteries of General Beauregard. The surrender of the fort, April 13, was followed by a sudden outburst of indignation in the North. The government called out 75,000 volunteers, large numbers of whom were in a few days marching to the defence of Washington. April 18, the Confederates seized the U. S. arsenal at Harper's Ferry, and took or destroyed a large quantity of arms and machinery. On the 20th, the navy-yard, near Norfolk, Va., was destroyed by the U. S. officers, and five large men-of-war burned or sunk, to prevent their falling into the hands of the Confederates. Opposed to the Federal volunteers assembled at Washington, the Confederates took up a position at Bull Run, a few miles distant from the Potomac, under General Beauregard, where they were attacked by General M'Dowell. A severe action resulted in the repulse and complete panic of the Federals, who hastily retreated to Washington. Congress saw that it must act in earnest, and that the rebellion was not to be put down in 90 days by 75,000 volunteers. It voted to call out 500,000 men. The Confederate States had a population of 5,582,122 free inhabitants, and 3,519,902 slaves; total, 9,102,024; and though the negroes were not called into the field except as labourers, they were not less useful in supplying the armies, by carrying on the agricultural labour of the country. The Confederates had also the strong sympathy and aid of the four slaveholding border states, prevented by their position from seceding—Delaware, Maryland, Kentucky, and Missouri.

Holding their position in Virginia, the Confederates erected fortifications on the Tennessee and Cumberland rivers, and on important points of the Mississippi, from Columbus, in Kentucky, to its mouth. They also made a strong effort to secure the state of Missouri, as well as to defend the seaports through which they must receive their most important supplies from abroad. The Federal government, on its side, blockaded the whole line of coast from Virginia to Texas, and sent large

forces to secure the doubtful states. Gun-boats were rapidly built for the rivers of the west, and vessels purchased and constructed for the navy. In December 1861, the Federals had 640,000 men in the field; and the Confederates had 210,000, and had called for 400,000 volunteers.

The first important operation of 1862 was the taking the defences of the Cumberland and Tennessee rivers (Feb. 6, and 16), which led to the occupation of Nashville, the capital of Tennessee, henceforth held by the Federals—Andrew Johnson, formerly governor and senator, having been appointed military governor. Roanoke Island was also captured, on the coast of North Carolina. In March, General M'Clellan, who had succeeded the aged Lieutenant-general Scott as commander-in-chief, commenced a movement on Richmond, the seat of the Confederate government, now defended by General Lee. On the 8th of March, the Confederate iron-clad *Virginia*, constructed from the U. S. steamer *Merrimac*, which had been sunk at Norfolk, and raised by the Confederates, attacked the Federal fleet in Hampton Roads, and in 40 minutes sunk the *Cumberland*, and set on fire and captured the *Congress* (frigates); while the other vessels took refuge in shoal water or in flight. The next day, the *Monitor*, a war-vessel of entirely novel construction, low and flat, with a revolving turret, invented by Captain Ericsson, engaged the *Virginia*. The battle ended in the repulse of the *Virginia*. On the 6th of April, a sanguinary but indecisive battle was fought near Corinth, Alabama, the Federals being protected by gun-boats. Soon after, Admiral Farragut, with a fleet of 45 vessels, carried the forts at the mouth of the Mississippi river, and took New Orleans; while the armies and gun-boats captured the fortifications on the upper part of the river as low as Memphis, Tennessee. In the meantime, General M'Clellan had besieged and taken Yorktown, and fought his way up the peninsula of the James River, until within five miles of Richmond, when he was beaten in a series of sanguinary battles, and driven, with a loss, in six days, of 15,000 men, to the shelter of his gun-boats; while Generals Banks and McDowell, sent to co-operate with him in the Shenandoah Valley, were defeated and driven back by General 'Stonewall' Jackson. On the 1st of July, the President called for 300,000, and August 4, 300,000 more men for the Federal army. Congress abolished slavery in the district of Columbia, prohibited it in the territories, and passed a resolution to compensate the masters in any state that would abolish slavery. They also authorised the President to employ negroes in the army, and to confiscate the slaves of rebels. In August, the Federals were a second time defeated at Bull Run, and General Lee crossed the Potomac into Maryland, creating great alarm in Washington, and even in Philadelphia. General M'Clellan made a rapid march, and met him at Sharpsburg or Antietam. The battle resulted in the defeat and retreat of General Lee, covering an immense train of provisions, horses, cattle, &c., which was probably the object of his expedition. A Confederate invasion of Kentucky, about the same time, was attended with similar results. Another advance on Richmond was led by General Burnside, who had superseded General McClellan; but he was confronted by General Lee at Fredericksburg, and defeated in one of the most sanguinary battles of the war. President Lincoln issued the "Emancipation Proclamation," declaring the freedom of all the slaves in the rebel states. This measure, though not strictly constitutional, was justified by military necessity. While the army of the Potomac was vainly endeavouring to advance on Richmond, the army of the Tennessee, under General Rosecrans, with its base at Nashville, was trying to sever the Atlantic from the Gulf States, and cut off the railways that supplied the Confederate armies in Virginia. At Murfreesborough, Tennessee, the Confederate General Bragg attacked General Rosecrans, but was repulsed in the battle of Stone River, and fell back to Tullahoma.

Early in May 1863, General Hooker, who had succeeded General Burnside in the command of the army of the Potomac, crossed the Rappahannock, and was defeated by General Lee at Chancellorsville with great slaughter; but this victory was dearly bought by the loss of General Jackson, mortally wounded in mistake by his own soldiers. General Lee now took the offensive, and invaded Pennsylvania, advancing as far as Harrisburg; but being met by General Meade, the new commander of the army of the Potomac, he attacked him in a strong position at Gettysburg, was defeated with severe loss, and compelled to recross the Potomac. In the meantime, the two principal fortresses of the Mississippi, Vicksburg and Port Hudson, attacked by land and water, after a long siege, were starved into capitulation, and the entire river was open to Federal gun-boats. Charleston, blockaded since the beginning of the war, was now strongly besieged—its outworks, Forts Gregg and Wagner, taken, Fort Sumter battered in pieces, but still held as an earthwork, and shells thrown a distance of five miles into the inhabited part of the city. In September, General Rosecrans had taken the strong position of Chattanooga, Tennessee, and penetrated into the north-west corner of Georgia, where he was checked by General Bragg at the battle of Chickamauga. At this period, there were great peace-meetings in the North, terrible riots in New York against the conscription and the negroes; while the banks having suspended specie payments, the paper-money of both Federals and Confederates was largely depreciated. The Confederates were, however, cut off from all foreign aid, except what came to them through the blockade, and their own resources, both of men and material, were becoming exhausted. The railways were worn, many destroyed or occupied by the Federals, and it became difficult to transport supplies and feed armies. The Federals had command of the sea, and access to all the markets of Europe.

At the commencement of 1864, the United States held, including the garrisons on the Mississippi, nearly 100,000 prisoners of war. The Southerners also had about 40,000 Federal prisoners, whom they could feed with difficulty, and who suffered great hardships. General Ulysses S. Grant, who had been successful at Vicksburg, was appointed commander-in-chief of the Federal armies, and commenced a vigorous campaign over an immense area—in Virginia, the Carolinas, Georgia, Louisiana, and Arkansas, with the determination 'to hammer continuously against the armed forces of the enemy and his resources, until by mere attrition he should be forced to submit.' Of the Confederates, General Lee defended Petersburg and Richmond; General J. E. Johnston opposed the army of Tennessee at Dalton, Georgia; General Forrest was in Mississippi; General Taylor and Kirby Smith commanded in Louisiana and Arkansas. In February, General Sherman marched from Vicksburg, making a destructive raid across Northern Mississippi to Alabama. In March, the Federals had 1,000,000 of men raised and provided for. The entire Confederate forces probably numbered 250,000. The army of the Potomac, commanded by General Meade, under the personal superintendence of General Grant, covered

Washington, and advanced toward Richmond. General Butler advanced from Fortress Monroe up the James River; General Sigel marched up the Shenandoah. Sherman united the armies of Tennessee, Cumberland, and Ohio, at Chattanooga, where he had nearly 100,000 men and 250 guns. General Banks had 61,000 men in Louisiana. In March, General Banks moved up the Red River, toward Shreveport, but was defeated on the 24th, and driven back to New Orleans. In May the campaign of Virginia commenced, and the army of the Potomac fought a series of battles at the Wilderness, Spottsylvania Court-house, Jericho's Ford, North Anna, and Cold Harbour, with terrible losses. After each battle, the United States forces took up a new position farther south, with a new base, until they had made half the circuit of the Confederate capital. General Breckinridge defeated Sigel in the Shenandoah valley, and once more threatened Washington. General Sheridan, with a strong cavalry force, drove back the Confederates, and laid waste the valley. In September, General Sherman, advancing with a superior force, captured Atlanta. General Hood, superseding Johnston in the command of the Confederates, was out-generalled and beaten. While he marched west to cut off General Sherman's base and attack Nashville, where he was defeated, Sherman burned Atlanta, destroyed the railway, and marched boldly through Georgia to Savannah. The Confederates made strong efforts, but they were unable to gain any advantages.

In 1865, the U. S. government made a new draft for 500,000 men. Expeditions were organized against Mobile. Wilmington, the most important Confederate port, was taken by a naval and military expedition. Savannah and Charleston, approached in the rear by Sherman, were evacuated. Cavalry raids cut off the railways and canal that supplied the Confederate army in Petersburg and Richmond. Finally, on March 29, 1865, a series of assaults was made upon the Confederate works, during ten days of almost continual fighting, until the Confederates were worn down with fatigue. Richmond and Petersburg were evacuated April 2; and on the 9th, after several conflicts, General Lee surrendered at Appomatox Court-house, his army numbering 28,000. At this period, it is said that there was not lead enough remaining in the Confederate States to fight a single battle. On the 12th, Mobile surrendered with 3000 prisoners and 300 guns. Then General Johnston, in North Carolina, surrendered a few days after to General Sherman; and the Trans-Mississippi Confederate army followed his example.

Mr Lincoln had been triumphantly re-elected to the presidency, with Andrew Johnson as Vice-president. On April 14, while the North was rejoicing over the capture of Richmond and the surrender of the Confederate armies, the President was assassinated at a theatre in Washington, by John Wilkes Booth, an actor; while an accomplice attacked and nearly killed Mr Seward, Secretary of State. The assassin was pursued and killed, and several of his accomplices were tried and executed, and others imprisoned on the Dry Tortugas, on the coast of Florida. Andrew Johnson became President. Jefferson Davis and the members of the Confederate government were supposed to be privy to the assassination of President Lincoln, and large rewards were offered for their apprehension. Mr Davis was captured in Georgia, and placed in Fortress Monroe on the 15th of Nov., 1865, but was released May 13, 1867, without trial. Immediately after the close of the war the President pardoned most of the prominent actors in the rebellion, and in 1866 proclaimed the restoration to the Union of all the seceded states; but their senators and representatives were not permitted to take their seats until a later date. 800,000 men were paid off and mustered out of the service.

During the war, the number of men called for by the Federal government was 2,759,049; the number actually furnished by the states was 2,653,062, when at the close of the war the drafts were discontinued. Of coloured troops, mostly recruited from the slaves, there were 186,097. By aid of railway lines, the armies sometimes made rapid marches; 23,000, with artillery, baggage, and animals, passed from Rapidan, Virginia, to Stephenson, Alabama, 1192 miles, twice crossing the Ohio, in 7 days. Railways were many times destroyed and repaired. Etowah Bridge, 625 feet long and 75 feet high, having been burned, was rebuilt by 600 men in 6 days. Chattahoochie Bridge, 740 feet long and 90 feet high, was rebuilt by 600 men in 4½ days.

The Federal losses during the war are estimated at 316,000. The state of New York, with a population of nearly 4,000,000, sent 223,836 volunteers, of whom 125,000 remained at the close of the war. The state of Pennsylvania, with a population of about 3,000,000, sent 362,284 volunteers, and issued 43,000 military commissions. There was an annual waste of one-third, half of which was by wounds in battle.

The statistics of the Confederate forces are imperfect. In 1864, the army consisted of 20,000 artillery, 128,000 cavalry, and 400,951 infantry; total 549,226, commanded by 200 general officers. The losses are unknown. See also UNITED STATES in SUPP. in Vol. X.

U'NIVALVES, in Conchology, are those shells which consist of only one piece. They are mostly the shells of gasteropodous molluscs, but some cephalopodous molluscs also have univalve shells, as the argonaut and nautilus, and even animals belonging to other divisions of the animal kingdom, particularly a few annelids, as *Serpula*, and the *Foraminifera*. There is, however, a difference in the structure of the shells, as well as of the animals to which they belong. In systems of Conchology, when the shell alone was regarded, and the animals had not yet been much studied, the usual division of U. was into *Unilocular* and *Multilocular*, the latter being the shells divided into chambers, as in the nautilus. The whole arrangement, however, was unnatural, bringing together in one group creatures widely different, and separating groups which in reality are very closely allied; for the mere presence or absence of a shell is often comparatively an unimportant circumstance, as amongst gasteropodous molluscs, in the case of snails and slugs, the near relation between which is manifest even to an unscientific observer. A naturalist knows by the mere shell, recent or fossil, the group to which the creature belonged, of which it was once the covering; he can not only tell the shell of a foraminifer or an annelid from that of a mollusc, and distinguish the shell of a cephalopod from that of a gastropod, but he can even decide as to the order of gastropods, and pronounce with confidence as to some of the habits of the animal. There are marked peculiarities in the U. of different geological periods well known and of great interest to geologists. 'The gastropods which first appear in the palæozoic strata have entire mouths; the siphonated species are not found lower than the lias, and they go on increasing in numbers in and from the tertiary series to the actual sea-shores.' These differences in the mouth of the spiral shell of a gastropod are connected with important differences in the organs of respiration. See GASTEROPODA and MOLLUSCA.

UNIVE'RSALISTS, a body of Christians whose distinctive peculiarity consists in their belief that 'evil' will ultimately be eradicated from the world, and that all erring creatures will be brought back to God through the irresistible efficacy of Christ's divine love. The grounds on which their faith in the final salvation of all men rests are derived more, perhaps, from reason than from Scripture; and when they *do* appeal to the latter, it is rather to the spirit and design of the Gospel than to particular passages. They argue, that when an infinitely wise, holy, and benevolent God resolved to create man, it could only be with a view to his everlasting good; that if he did allow him to be tempted and fall, it must have been because he foresaw that through sorrow and suffering man could rise to higher degrees of perfection; that therefore all punishment (or what, with our limited knowledge, we conceive to be such) is of necessity designed as a remedial agent, and not intended to satisfy God's indignation as a sovereign at the disobedience of his subjects; that no other view of the subject is compatible with the Scriptural, and especially the New Testament representation of God as a 'Father,' or with the oft-repeated declaration (in various terms) that Jesus Christ was a propitiation for the sins of the whole world. In answer to those who adduce against them the express language of Scripture; e. g., 'And these shall go away into everlasting punishment: but the righteous into life eternal' (Matthew, xxv. 46), they reply, that the word *aiōnios*, translated 'everlasting,' does not necessarily bear that signification; that properly it does not express the idea of duration at all, either finite or infinite, but was rather used by the sacred writers to denote a mode of existence distinct from and wholly dissimilar to any mere *chronic* state; in proof of which they point to such passages as—'*This is life eternal*, that they might know thee, the only true God, and Jesus Christ, whom thou hast sent' (John, xvii. 3), where eternal life is affirmed to be *knowledge*—that is, a present state of mind, and not a perpetual hereafter of duration.

U., it may be observed, generally differ from the prevalent bodies of Christians in other important doctrines, though it is not because of such differences that they have received their name, nor is it necessary to merit the name that one should share these differences. Most of them agree with Unitarians—but there are eminent examples to the contrary—in rejecting the doctrine of the Trinity; they are also Pelagian in the matter of original sin, and reject the notion that the new birth is something supernatural.

Universalism, as a mode of belief, is of very ancient origin, and its modern adherents, besides urging its congruity with the divine plan of redemption, as revealed in Scripture, point to the earliest Christian writings; e. g., the *Sibylline Oracles* (150 A. D.—see SIBYL)—expressly composed to convert pagans to Christianity—as evidence that the doctrine was recognised from the first. Passages in favour of the doctrine are cited from many of the church fathers—Clemens Alexandrinus; Origen; Marcellus, Bishop of Ancyra; Titus, Bishop of Bostra; Gregory, Bishop of Nyssa; Didymus the Blind, president of the Catechetical School of Alexandria; Diodorus, Bishop of Tarsus; Theodore, Bishop of Mopsuestia; and Fabius Marius Victorinus. It is said to have been held by some of the Albigenses and Waldenses, the Lollards and the Anabaptists, and it probably had isolated supporters in most of the countries into which the Reformation penetrated. Nor has it wanted illustrious adherents belonging to the Church of England and the Nonconformists, among whom it is customary to rank Archbishop Tillotson, Dr Burnet, Bishop Newton, Dr Henry More, William Whiston, Jeremy White (chaplain to Oliver Cromwell), Soame Jenyns, David Hartley, William Law, and (in our own day) Thomas de Quincey and Professor Maurice. The same remark is applicable to the French Protestant and German Churches, and indeed it may safely be asserted that the *non-clerical* mind in all ages is disposed to look favourably upon the doctrine of the universal restoration to holiness and happiness of all fallen intelligences, whether human or angelic. Hence the irrepressible sympathy of men, however orthodox, with the language of Burns:

> Then, fare ye weel, auld Nickie Ben.
> Oh, wad ye tak a thocht, and men'
> Ye aiblins micht—I dinna ken—
> Still hae a stake.
> I'm wae to think upo' yon den,
> E'en for your sake.

But the existence of U. as a distinct religious sect is a feature of American rather than of English religious society. About the year 1770, the Rev. John Murray became a propagator of Universalist views; and since his time, an organised body has sprung up, which contains many able, learned, and pious divines. According to the 'Register' of the denomination published in 1871, there are in the United States 904 parishes, owning 687 churches, and ministered to by 621 preachers. These societies have under their patronage 10 institutions of learning, including 4 colleges and 7 academies, and they support 13 periodicals. Various missionary, tract, and Sunday school associations are also employed in teaching and propagating their peculiar views.—See *Ancient History of Universalism*, by the Rev. Hosea Ballou; and the *Modern History*, by the Rev. Thos. Whittemore (Bost. 1830; new edit., 1860 *et seq.*).

UNIVERSAL LEGATEE is a legatee to whom the whole estate of a deceased party in Scotland is given, subject only to the burden of other legacies and debts. It nearly corresponds to residuary legatee in England.

UNIVE'RSITY (Lat. *universitas*, corporation), a corporation of teachers or students instituted for the promotion of the higher education. Mr Kirkpatrick, in his *Historically Received Conception of a University* (Lond. 1857), points out the prototype of the universities of modern Europe in the schools of Isocrates and Plato at Athens, and the Museum at Alexandria. These institutions certainly much resembled the university of after-times, both in their objects and their organisation; and in Greece and Rome, as well as in the later Byzantine Empire, something analogous to the degree was conferred on those who had successfully passed through the *trivium* or *quadrivium*, which together comprised what was regarded as the seven liberal arts and sciences. The university is, however, usually considered to have originated in the 12th or 13th c., and to have grown out of the schools which, prior to that period, were attached to most of the cathedrals and monasteries, providing the means of education both to churchmen and laymen, and bringing together the few learned and scientific men who were to be found in Europe. Such an institute of the higher learning was at first called *studium* or *studium generale*. When a teacher of eminence appeared, such as Abelard or Peter Lombard at Paris, or Irnerius at Bologna, a concourse of admiring students flocked round him; and the members of the *studium generale* formed themselves, for mutual support, into a corporation on which the general name of *universitas* came to be bestowed.

In this way, the oldest universities arose spontaneously. The crowds drawn from every country of Europe to Paris, Bologna, and other educational resorts, had first local immunities bestowed on them for the encouragement of learning, and to prevent them removing elsewhere; and the academical societies thus formed were by papal bulls and royal charters constituted an integral part of the church and state. One great difference existed between the constitution of the two most important universities of early times. In Paris, the teachers alone constituted the corporation; in Bologna, the university consisted of the students or scholars, who at first held the supreme power, and appointed the academic officials. In this respect, Bologna became the model of the subsequent universities of Italy and the provincial universities of France, which were corporations of students; while the universities of Britain, Germany, Holland, and Scandinavia were like Paris corporations of teachers, and the Spanish universities occupied an intermediate position. Along with a general resemblance, there was much difference in the constitution and character of the pre-Reformation universities, the form of each being the result of a combination of various circumstances and ideas acting on an originally spontaneous convocation of teachers and scholars.

The several *faculties* of a university are subordinate corporations, consisting of the aggregate of students or teachers in a particular department of knowledge. The number of faculties has varied much in different universities. The university of Paris had at first only a faculty of arts, which, as early as 1169, existed as a separate body, with an organisation of its own. Faculties of theology, medicine, and canon law were added in the 13th century. Bologna was at first exclusively, as it continued to be pre-eminently, a school of law. Oxford and Cambridge, in their origin, existed only in the faculty of arts. Some of the smaller French universities, as Orleans and Montpellier, were prohibited from teaching theology, lest they should become rivals to Paris.

The granting of degrees was the mode in which the university reproduced itself. A degree is the recognition of a student having made a certain advance in his career, the degree of Doctor or Master, in its original idea, entitling the person on whom it was conferred to teach within the limits of the university. Towards the end of the 13th c., Pope Nicholas I. granted to the university of Paris the right of endowing its graduates with the power of teaching everywhere; and this universal degree, making the recipient of it a member of the community of the learned throughout Christendom, became a link of connection between the universities of Europe. The designation of *Bachelor*, borrowed from the term indicating the probationary stage of knighthood, and implying the lowest stage of university honour, or the condition of an imperfect graduate, was first introduced in the 13th c. in the university of Paris, where the bachelor, though intrusted with certain tutorial functions, possessed no legislative power. The right of teaching (*regendi*) belonged to the master, doctor, or other perfect graduate; and a period of necessary regency was generally fixed, during which the graduates were bound to teach, and after the expiry of which they were at liberty to become non-regents. It, in the course of time, became the practice to endow a select number of the graduates as public authorised teachers; these privileged and salaried graduates were designated *Professors*, and instruction by professors more or less supplanted the original plan of teaching by graduates.

The poverty of a proportion of the students, and the desirableness of domestic superintendence, suggested the institution of halls endowed with property and corporate privileges, called *Colleges*. Though originally a provision for poor scholars, they soon assumed the character of boarding-houses for all classes of students, where they were privately trained and prepared for the public lectures. Colleges seem to have been first introduced in Paris, where most of them became appropriated to a particular faculty, or department of a faculty. The college of the Sorbonne, founded in 1250, came to be in a great measure identified with the theological faculty. Regent masters were named by the faculties as lecturers in the colleges, attendance on whom was made equivalent to attendance on the public courses in the schools of the university, and eventually the college lectures were thrown open to all members of the university; and it became obligatory in the faculty of arts, and usual in the other faculties, to become a member of some college.

The two highest university officers have generally been the *Rector* and the *Chancellor*, the former being the head of the university in everything except the granting of degrees, which are conferred by the latter as the fountain of honour. Besides the division into faculties, there was in most of the continental universities a division of the graduates and students into *nations*, in respect of the countries to which they belonged. In Paris, the faculty of arts was divided into four nations, known as French, Picard, Norman, and German or English; and after the 13th c., these four nations, under their respective procurators, and the three subsequently added faculties under their deans, constituted the seven component parts of the university. The rector, with the procurators and deans, formed a court having cognizance of all matters relating to discipline, from which there was an appeal to the university, and from thence to the parliament of Paris. In Bologna, after faculties of philosophy, medicine, and theology had been added to those of civil and canon law, the students were classed as *ultramontani* and *citramontani*, and each class divided into nations, presided over by their several counsellors or procurators.

The university, with modifications called for by the altered circumstances of society, has survived the revolutions of seven centuries. At present, Europe possesses about 100 universities, some dating from the 12th and 13th centuries, and others of various degrees of antiquity, including some founded in the present century. About 30 belong to Germany, and 20 to Italy; Holland, Belgium, Scandinavia, Spain, Portugal, Russia, and Greece contain among them about 30 universities. England has four—two ancient, Oxford and Cambridge; and two modern, London and Durham. Scotland has the four universities of St Andrews, Glasgow, Aberdeen, and Edinburgh; and Ireland has Trinity College, Dublin, and the three affiliated colleges of the Queen's University.

Of the universities of Germany, the oldest are Prague, founded in 1348, and Vienna, in 1365. Heidelberg dates from 1386; Leipzig, 1409; Tübingen, 1477; Jena, 1558; Halle, 1694; Göttingen, 1737; Berlin, 1810; and Bonn, 1818. The chief administrative body of the German universities is the Senatus Academicus, composed of the ordinary professors, presided over by a rector elected yearly, or (at Halle and Tübingen) by a chancellor appointed for life, the exercise of discipline being, however, intrusted to a separate court, presided over by a judicial officer called the Syndic. There is a recognised gradation in the professorial office. The highest class are *ordinary professors*, generally men of considerable eminence in their respective departments, elected by government out of three

candidates submitted by the faculty to which they belong. Next to them are the *extraordinary professors* of the same branches, with smaller salaries; and then the class of *privat-docents*, who, in the course of time, qualify themselves to be extraordinary professors. An ordinary professor must deliver public lectures on the branch to which he is appointed; an extraordinary professor, or privat-docent, may lecture on what subject he pleases. The student is for the most part at liberty to attend what lectures he pleases; but licenses to practise certain professions, benefices in the church, and other posts, are only given to persons who have gone through a certain course of university study. In addition to the above-mentioned classes of instruction, there are attached to the university teachers of modern languages and other branches not forming part of the curriculum. The *Bursæ*, foundations resembling in their origin the English colleges, and the *Convikt*, or free table, are institutions for the benefit of the poorer students, from the former of which is derived the name *bursche*, popularly applied to a student in Germany. The German university system is admirably adapted to promote the advancement of science; its deficiency is chiefly in appliances for superintending the progress of the individual student. The professor is often more an instructor of the world at large by his writings, than of his students by his lectures.

The two great English universities are little inferior in antiquity to Paris and Bologna. From the beginning of the 12th to the middle of the 14th c., Oxford played nearly as important a part in the advancement of science and political life as Paris itself, with which it was connected by intimate ties, the most eminent doctors of Oxford acting at the same time as regent-masters in Paris. It espoused the cause of the barons against the crown, and while preserving an intimate relation with the church, generally sided against ecclesiastical abuses. Oxford and Cambridge, not unlike the continental universities in their origin, developed themselves in a manner peculiar to England. From an early period, it was the practice of the students to live in common in halls or hostels, rented from the burghers, under the charge of a common teacher. In 1280, there were no fewer than 34 halls at Cambridge, some containing as many as 20 to 40 Masters of Arts, and a proportionate number of younger students. In the course of time, colleges were endowed by benevolent persons for the maintenance of the poorer students, and the name *socii*, or *fellows*, was applied to the recipients of the endowments. This assistance was originally meant to last no longer than the completion of the course of study; but as most of the *socii* belonged to the ecclesiastical order, and had no other means of support, an understanding gradually arose that the aid furnished by the college should be continued to the *socius* till he succeeded in obtaining a benefice. These provisions gradually increased in number and importance; and a practice was introduced of the colleges receiving wealthier students as boarders—the origin of the class of commoners or students not on the foundation. Most of the halls fell into decay, and those that remained received a collegiate character. In the 15th c., fellowships were no longer endowed to assist students going through their course of study, but as a permanent provision for poor young men of the clerical order who shewed a taste for learned pursuits, and the degree of Master was made a necessary condition for holding them. In this way, the colleges became the university; the university acquired a semi-monastic character, which has since more or less adhered to it; and a tutorial system of education within the colleges was almost entirely substituted for instructions by university professors. For two centuries, the staff of professors have had little to do with academical education or discipline. The instruction of the student is committed to college tutors, assisted by private tutors, and attendance on the professors is in general neither required for university rank nor for college emoluments. The tutorial system is defended on the ground of its giving the instructor a greater hold over the student's attention. On the other hand, it lacks the advantages arising out of the division of labour in the professorial system; and it is now generally allowed that a mixture of both systems of teaching is better than either alone. An effort has been made by the new statutes to render the professorial office in Oxford and Cambridge rather less of a sinecure than formerly. One of the most remarkable features of the English universities is their wealth in endowments. The fellowships and scholarships of Oxford, with the ecclesiastical benefices in her gift, amount to about £450,000 annually. For the mode of government, see CAMBRIDGE; OXFORD.

Of the two modern English universities, London University (q. v.) was established by royal charter in 1836. Durham University was opened for students in 1833, and obtained the right of conferring degrees by royal charter in 1837. The general provisions for education are similar to those of Oxford and Cambridge, and there is also a course of theological study. In 1837, a course of instruction was added in mining and civil engineering. The university of Dublin (q. v.), founded in 1591, consists of a single college, named Trinity, with a constitution similar to the colleges of Oxford and Cambridge; but the professorial element is to a large extent united with the tutorial.

The universities of Oxford and Cambridge have since 1603 returned two members each to the House of Commons, and the same privilege is enjoyed by the university of Dublin.

The universities of Scotland, mostly founded in the 15th c., approached much more nearly to the type of Germany and the Low Countries than of England. The teaching as well as governing body were the professors; and the college was a building for the accommodation, not of the students or fellows, but of the professors, as public lecturers. Though nearly all the students were Scotchmen, they were nevertheless divided, according to continental usage, into four nations, named from the parts of Scotland to which they belonged. In St Andrews, there were from the first the separate faculties of divinity, arts, and canon law. A pædagogium was erected in 1430 for the faculty of arts. In 1450, Kennedy, Bishop of St Andrews, established and endowed the college of St Salvator, to which Pope Paul II. accorded the privilege of conferring degrees in theology and the arts, constituting it to that effect a separate university. St Leonard's College was founded in 1512, and St Mary's in 1537, with power of conferring degrees. After the Reformation, St Mary's was restricted to the study of theology; and in 1747, St Salvator and St Leonard were united. Glasgow had its lecturers in canon and civil law, and theology, from the beginning. The faculty of arts, however, alone received a definite shape and constitution; it had, as at St Andrews, a pædagogium; and prior to the Reformation, had nearly absorbed the university. During the Reformation period, Glasgow University was nearly annihilated; but it was restored by the exertions of Queen Mary and James VI. 'The university of Aberdeen, as now constituted, derives its origin from two different foundations—one, the university

and King's College of Aberdeen, founded in 1494 by William Elphinstone, Bishop of Aberdeen, under the authority of a papal bull obtained at the instance of King James IV.; the other, Marischal College and University of Aberdeen, founded in 1593 by George Keith, Earl Marischal, by a charter ratified by act of parliament' (*Aberdeen University Calendar*). By the Universities (Scotland) Act, 1858, King's and Marischal College have been incorporated into one university and college, as the university of Aberdeen—King's College being reserved for the faculties of arts and divinity, and Marischal College for law and medicine. The university of Edinburgh, founded after the Reformation, had but little of the ancient university character, being a professorial seminary on a royal foundation, rather than a society of graduates or students. James VI.'s charter of foundation placed it in the hands of the magistrates of the city, who remained its patrons till 1858. Each of the Scottish universities has its bursaries or scholarships; most numerous at Aberdeen, and least so at St Andrews; but they are insignificant in amount compared with the similar endowments of the English universities.

The Scotch universities have been much modified in various respects by a statute passed in 1858. For some time previous, there had been a growing conviction that they were not keeping pace with the intelligence of the country. The absence of sufficient preparation on the part of the students obliged the professors of languages and mathematics to discharge inefficiently the functions of schoolmasters rather than their proper duties. Scholarship had declined, and a Scottish degree in arts had fallen into disrepute. These evils were sought to be cured by establishing an entrance examination, by grafting a certain amount of the tutorial on the professorial element, and by raising the standard of examination for degrees, so as to make them objects of ambition. The act of 1858 placed the Scottish universities under the superintendence of a Board of Commissioners for the space of four years, who had power to carry the statutory provisions into effect. A uniform constitution was given to all the universities, each of which has now three governing bodies, the Senatus Academicus, the University Court, and the General Council; the chief officers being the chancellor, the vice-chancellor, and the rector. The *Senatus Academicus*, composed of the principal and professors, superintends the teaching and discipline, and administers the property and revenues of the university, one-third being a quorum, and the deliberations being subject to the control of the University Court. The principal presides, and has both a deliberative and a casting vote. The *University Court* consists of the rector, the principal, and assessors named by the chancellor, rector, General Council, and Senatus Academicus (in Edinburgh, the Lord Provost, and an assessor elected by the town-council, are also members of the court). The rector is president, with a deliberative as well as a casting vote. The rector, and the assessor nominated by him, continue in office for three years; the other assessors for four years. The functions of this body include the reviewing of the decisions of the Senatus, the regulation of the internal arrangements of the university, in conjunction with the Senatus, the chancellor, and the University Court; and the exercise of patronage to the chairs whose patronage was formerly in the Senatus. The *General Council* consists of the chancellor, the members of the University Court, the professors, masters of arts, doctors of medicine who have attended four sessions, and all persons who, prior to August 1861, produced evidence of attendance for four complete sessions, two of them being in the faculty of arts. The Council meets twice a year, the chancellor, whom failing, the rector, or principal, or senior professor present presiding, with a deliberative and casting vote. The duties of the Council are not legislative, but only deliberative; it may entertain any question affecting the university, and make representations regarding them to the University Court. The chancellor is elected by the General Council, and holds office for life; he appoints a vice-chancellor, who may act for him in conferring degrees, which is his principal function. The rector is elected by the matriculated students, and holds office for three years. At Edinburgh, the patronage of those chairs which were in the gift of the town-council has been transferred to seven curators, three of them nominated by the University Court, and four by the town-council. Entrance examinations have been instituted in all the universities, and assistants appointed to several of the professors, with functions somewhat analogous to those of tutors in England. The degrees now conferred in the Scotch universities are Master of Arts, Bachelor of Divinity, Bachelor of Laws, Bachelor of Medicine, Master in Surgery, and Doctor of Medicine; besides Doctor of Divinity and Doctor of Laws, which are purely honorary. Edinburgh grants, in addition, the degrees of Bachelor of Science and Doctor of Science. The degree of Bachelor of Arts is not now given in any of the universities of Scotland.

UNIVERSITY COLLEGE, the oldest college in the university of Oxford, is said to have been founded as early as 872 by Alfred the Great. It was restored by William of Durham, rector of Wearmouth, who, at his death in 1249, left a sum of money to form a permanent endowment for a certain number of 'masters,' preference being given to those who were born nearest the city of Durham. Among the subsequent benefactors are found King Henry IV., who founded (1403) three fellowships, at the request of Bishop Skirlaw of Durham (who consequently is also ranked as a 'benefactor'); Henry Percy, Earl of Northumberland, who founded (1442) three fellowships; Sir Simon Bennet, Bart., who founded (1631) four fellowships and four scholarships; &c. In 1714, Dr John Radcliffe attached to this college two fellowships, tenable for ten years by Masters of Arts, who are required to travel abroad during five years. The present foundation consists of 1 master, 13 fellows, 17 scholars, several exhibitioners, and a Bible clerk. The patronage consists of 10 livings, situated in the counties of Dorset, Gloucester, Hants, Hertford, Huntingdon, Oxford, Somerset, Sussex, and York, of an aggregate annual value of £5032.

UNIVERSITY OF FRANCE. In France, since the Revolution, the word University has acquired a meaning widely different from that which it bears in other countries; the expression 'Université de France' being nearly equivalent to 'National system of education of France.' All the old universities of

the country having been swept away at the Revolution, education had fallen into abeyance. After various attempts at the establishment of primary, secondary, and central schools in the departments, the imperial government adopted a new system, by which the whole educational machinery of the country was centralised at Paris, and committed to a body called the University, with a Grand-master at its head, assisted by a council. The system has undergone various alterations in 1814, 1850, 1852, and 1854. The governing body, the Council of Public Instruction, is now presided over by the Minister of Public Instruction, who has come in place of the Grand-master. It has control over all educational institutions, from elementary schools upwards. The Academies, of which there are 27, serve the same purpose as the universities of other countries, each having a territory of two or more departments allotted to it. They contain faculties of literature, law, medicine, and Catholic and Protestant theology; all these faculties, however, not being organised in every Academy. The colleges and schools of primary instruction are, in their turn, placed under the direct jurisdiction of the Academies.

UNKIAR-SKELESSI, a small town on the Asiatic shore of the Bosporus, in the neighbourhood of Scutari, gives its name to a treaty concluded between Turkey and Russia, July 8, 1833. This treaty, which consisted of six articles, was one of mutual defensive alliance; but a separate and secret article was subjoined, by which the sultan, in place of the military or naval aid which, by the first article of the treaty, he was bound to furnish to Russia, agreed to close the Strait of the Dardanelles, allowing no foreign vessels of war to enter it under any pretext whatever. In consequence of this treaty, Russia landed 15,000 men at Scutari, and stopped the victorious career of Ibrahim Pasha (q. v.). The secret article was soon after divulged to Britain and France, both of whom regarded the treaty with dislike; and by the terms of that concluded at London, July 13, 1841, the stipulations of U. were annulled.

UNLEAVENED BREAD, USE OF, in the Eucharist, has long been a subject of controversy between the Latin Church on the one hand and the Greek and other oriental churches on the other; with the latter of whom the Reformed churches in later times have conformed in their practice of celebrating the Lord's Supper. The early history of the usage is very obscure; but the Western Church had certainly, from a very remote date, employed *Azyms*, or unleavened bread, in the consecration and distribution of the Eucharist; nor was this usage made a subject of controversy with the Latins by Photius, on occasion of the dispute between the churches, which arose during his patriarchate. In the later controversy, however, under Michael Cerularius (see GREEK CHURCH), the question of azyms became very prominent, and the diversity of practice still continues a subject of controversy between the Greeks and Latins. The principal argument alleged by the advocates of the use of leavened bread, is founded on the assumption that the Last Supper of Our Lord took place on the eve of the Passover, that is, on the 13th day of the month Nisan, on which day common bread, and not the azyms, must have been used; and on this and some other grounds, some writers, even among the Roman Catholics themselves, and especially the learned Jesuit Sirmond, have maintained that the Last Supper was actually celebrated in leavened bread. On the other hand, however, it is contended that the Last Supper, being held in the evening of that day, was, in the strictest sense, Our Lord's celebration of the Passover, and therefore (Exodus, xii. 8—20), that the bread can have been no other than azym, or unleavened. It must be added that all Roman Catholic writers, and the more learned among the Greeks, are agreed that the Eucharist may be *validly* consecrated whether the bread be leavened or unleavened.

UNNA, a small town of Prussia, in Westphalia, 19 miles north-west of Arnsberg. It was formerly fortified, was one of the Hanse Towns, and played a *rôle* in the history of the Femgerichte (q. v.). About a mile to the north are the famous salt-works of Königsborn, which yield 120,000 cwts. of salt annually. Pop. (1872) 6915, who are employed in weaving linen and hosiery, and in brewing and distilling.

UNST, the most northern of the Shetland Islands, in lat. 60° 45′ N., is 12 miles long, and 3½ miles in average breadth; area, 36 sq. m.; pop. (1861) 3042. The coast is much broken, and the headlands are rocky, mural, and lofty. There are 2000 acres under cultivation, and about as many in pasture. Valuable minerals abound, and chromate of iron is an article of commerce. The island contains numerous tumuli, a chain of Scandinavian dunes, and the ruins of upwards of 20 ancient chapels. Fishing and agriculture are the chief employments.

UNTERWALDEN, one of the Waldstädten, or Forest Cantons of Switzerland, forms part of the Hill Country which surrounds the Lake of Lucerne (see SWITZERLAND). It is 25 miles in length by 21 miles in breadth, and has an area of 297 sq. miles. In 1850, the pop. was 25,138; in 1870, it was 26,116. U. is bounded on the E., S., and W. by lofty hills, and subsidiary ridges divide it into two parallel valleys—both of which open on the north into the Lake of Lucerne. The eastern valley is drained by the Engelberger Aa, the western by the Sarner Aa. Great highways run up these valleys from the shores of the lake, and in several places communicate with each other; but they do not connect U. with surrounding cantons. The canton is chiefly pastoral. Some attempts have been made to cultivate the vine, but they have not proved successful. The language of the people is a Swiss-German dialect; their religion is Roman Catholic. U. is divided into two parts; not, however, corresponding with the two river basins of which it is formed. The forest of Kerns, or Kernwald, formed the line of separation between these two districts, which were separate so early as 1150. One is named the Obwald, or district above the Forest, and includes the whole of the western valley. The other is the Nidwald, which includes only the lower part of the eastern valley. Each division forms an independent republic, with its own administration. Both have a *landesgemeinde*, or parliament, composed of all the inhabitants 20 years of age, with the exception of a few *heimathlosen* (tramps); and each forms a half-canton, that is, a canton which returns one member to the Swiss Council of State. The landesgemeinde of each half-canton assembles in the open air late in the spring, when it passes new laws, pays off accounts, imposes taxes, and appoints the executry officers. The capital of the Nidwald is Stanz, remarkable for its fine church and statue of Winkelried. The capital of the Obwald is Sarnen. Each of these towns has a pop. of about 2000.

UPANISHAD is the name of those Sanscrit works belonging to the Vedic literature which contain the mystical doctrine of the Hindus on the nature of a supreme being, its relation to the human soul, and the process of creation (see INDIA, see *Religion*). The word (derived from the Sanscr-

prefixes *upa*, 'beneath,' or 'near,' and *ni*, 'in,' combined with the radical *sad*, 'sit') is explained by the great theologian *S'ankara* (q. v.), and others after him, as meaning the 'science of Brahman,' or 'the understanding of the identity of Brahman and the soul,' because 'in those devoted to it, this science *sets to rest* (or destroys) the world, together with (ignorance) its cause;' or, in other words, because it shews to them that the world has, besides Brahman, no reality. Grammatical commentators explain its etymology as implying that 'eternal bliss *reposes on it* (*upanishîdati s'reyo 'syâm*);' and Professor M. Müller has surmised that the word 'Upanishad meant originally the act of sitting down near a teacher, of submissively listening to him,' whence it came to mean 'implicit faith, and at last truth or divine revelation.' But apart from the artificialness of all these interpretations, it deserves notice that the earliest sense of the word appears to be that of 'secret' or 'mystery' (literally, 'that which *sits* or rests *beneath*'). In this sense, it is mentioned by the grammarian Pân'ini; and as it is very probable that, in his time, the works bearing the name of Upanishads were not yet in existence (see Goldstücker's *Pân'ini*, &c., p. 141), it may be assumed that these works derived their name from the mysteriousness of the doctrine contained in them; and perhaps also from the mystical manner in which they propounded it.

In order to understand the origin and purport of the Upanishads, as well as the relation in which they stand to the Vedas, properly so called, it must be borne in mind that, though the Vedic hymns are based on the worship of the elementary powers, and the Brâhman'a portion connected with them is chiefly concerned in legendary and ritual matter relating to that worship, yet in both these portions of the Vedas, and especially in the Brâhman'as, the beginnings of a period become already visible when the poets raised the questions as to the origin of the world and the true nature of the gods. See INDIA, sec. *Religion.* A first attempt at a systematic answer to these questions was made in works which bear an intimate relation to the Brâhman'as; and so great was the awe in which, on this account, these works were held, that they had to be read in the solitude, where the mind could ponder in perfect calmness over the mysterious problems in which they are engaged. These are the *Âran'yakas* (from *aran'ya*, a forest). But as the style and contents of the Âran'yakas are extremely obscure, and as, through the close alliance of these works to the Brâhman'as, of which some of them form part, the theological questions of which they treat are much overlaid with ritual and other matters which properly belong to the Brâhman'as, a further progress made in the same direction, led to the composition of works and treatises, the diction of which is somewhat clearer, and less entangled with subjects extraneous to the problems they intend to solve. Such works and treatises are the *Upanishads.* Their object, like that of the Âran'yakas, is to impress the mind with the belief in one Supreme Spirit (*Brahman*, as a neuter, and different, therefore, from the same word as a masculine, which is the name of the first god of the *Trimûrti*, q. v.), to shew that this Supreme Spirit is the creator of the world; that the world has no reality if thought of besides Brahman, and that the human soul is identical in nature with that same Spirit whence it emanates. The reward the Upanishads hold out to the believer, who understands their doctrine, and firmly adheres to it, is freedom from Transmigration (q. v.), and consequent eternal bliss. The object and aim of the Upanishads are therefore the same as those propounded in the philosophical systems (see SANSCRIT, sec. *Literature*); and the Upanishads may therefore be looked upon as the forerunners of these systems themselves — those Upanishads, at least, which we may call the older Upanishads; for as to the more recent ones, and those which bear the stamp of a sectarian character, their claim to be ranked among the Vedic writings is extremely doubtful, if at all admissible.

Though agreeing in the main points of their doctrine, it is easily understood that works of this nature, ranging over different periods of Hindu religion, will also differ from one another both in the manner and detail in which they deliver their subject-matter, and in the degree of completeness with which they treat of it. Thus, in some, the legendary narrative, and even ritual detail, are still considerably blended with the theosophical speculation—and these stand nearest, therefore, the Âran'yakas, probably also in time; in others, more philosophical, the nature of Brahman and the human soul is the only subject of inquiry; in others, the process of creation is also enlarged upon, with detail which harmonises more or less either with the ulterior views of the Vedânta (q. v.) or those of the Sânkhya (q. v.) philosophy; some Upanishads, again, especially emphasise the inefficiency, for the attainment of eternal bliss, of the performing religious acts and of worldly studies—the knowledge of Brahman being the only means that leads to this end; others, on the contrary, in conformity with the Yoga (q. v.) doctrine, assign a prominent place to the exterior means, by using which the soul would qualify itself for union with the Supreme Spirit; while the sectarian Upanishads, which identify this Spirit with Vishn'u and S'iva, have, besides, the tendency of reconciling the popular with the philosophical creed.

Of the older Upanishads, a typical instance is furnished in the Chhândogya Upanishad of the Sâmaveda, the framework of which is legendary throughout, and its contents allegorical and mystical. Other shorter Upanishads, freer from narratives and allusions to the mysterious import of ritual acts, aim at a more intelligible exposition of the doctrine of the soul. Of their mode of treatment, the following passage from the *Kât'haka* Upanishads will serve as an example: *Nachiketas*, the son of Vâjas'ravas, having come to the abode of Yama, the judge of the dead, and obtained from him the grant of three boons, asks of him, for his third boon, an answer to the following question: 'There is this doubt: some say that (the soul) exists after the death of a man (in connection with another body than this); others say that it does not. This I should like to know, instructed by thee.' And Yama, after some hesitation, explains to him that the soul and Brahman are one, but that a man attains immortality only by understanding this unity, and that, to arrive at this understanding, he must free his mind from sensual desires, and get a correct knowledge both of the nature of Brahman and of the soul. 'Know the soul as the rider, and the body as the car; know intellect as the charioteer, and *manas* (the organ of volition) as the rein. The senses, they say, are the horses, the objects (their) roads; and the enjoyer (i. e., the rider) is (the soul) endowed with body, senses, and manas. Thus say the wise. If he (the charioteer) is unwise, and his manas is always unbridled, his senses are uncontrolled like vicious horses; but if he is wise, and his manas is always bridled, his senses are controlled like good horses. He who, always impure, is unwise, and whose manas is unbridled, does not attain *that* abode (of immortality), but comes to the world (of birth and death); he, however, who, always pure, is wise, and whose manas is bridled, he attains *that*

abode whence he is not born again. The man who has a wise charioteer, and whose manas is bridled, reaches the other shore of the road (of the world), the highest abode of Vishn'u. Higher (i. e., subtler), indeed, than the objects are the senses; higher than the senses is manas; higher than manas, intellect; and higher than intellect, the great one, the soul. Higher than the great one is that which is unmanifested, and higher than the unmanifested is Purusha, the supreme spirit. But higher than Purusha there is nothing; he is the goal, the highest resort. This highest spirit is the soul hidden in all created beings; it is not manifest, but is beheld by those who can see what is subtle with an attentive, subtle intellect.' The coincidence between the allegory, in the foregoing passage, and that in Plato's *Phædrus*, imparts an additional interest to this Upanishad, which is valuable, moreover, on account of the evidence it affords as to points of agreement and difference between its views of the development of the world and those expounded in the Sânkhya (q. v.). The *Mun'daka* Upanishad is important for the relative position which it assigns to the teaching of the Vedas, and the doctrine of the Upanishads. 'Two sciences,' it says, the knowers of Brahman tell us, 'must be known, the higher and the inferior. The inferior is (the knowledge of) the R'igveda, the Yajurveda, the Sâmaveda, and the Atharvaveda, the knowledge of pronunciation, the ritual, grammar, explanation of Vedic texts, prosody, and astronomy. But the higher knowledge is that by which that imperishable Brahman is comprehended. That which is invisible, unseizable, without descent (or origin), without either colour, eye, or ear, without hand or foot, eternal, manifold (in creation), all-pervading, very subtle, undecaying—the wise behold it as the cause of created beings.' And in another place, the performers of the sacrificial rites ordained by the Veda are said to attain, indeed, to Indra's heaven in virtue of their pious work; but this state of bliss is declared to be unstable and perishable, and these 'fools . . . . drop (from their heaven) as soon as this heaven (the reward of their acts) has faded away. Fancying that pious acts, ordained by the Vedas and codes of law, are the highest (object of man), these ignorant people do not know that there is something else which leads to eternal bliss. Having enjoyed (the reward of their deeds) on the happy summit of paradise, they enter again this world, or one that is (even) lower. Those, on the contrary, who practise penance and faith, and, with subdued desire, live in the forest, under the vow of a religious mendicant, they, free from sin, enter through the sun to that abode where resides that immortal spirit, that spirit, indeed, of undecaying nature.'

The *Talavakâra*, or *Kena*, Upanishad, which, being one of the shortest, is in form one of the most philosophical treatises of this kind, puts in clearer language, perhaps, than any other Upanishad, the doctrine that the true knowledge of the supreme spirit consists in the consciousness which man acquires of his *incapacity* to understand it, since the human mind being capable only to comprehend finite objects, cannot have a knowledge of what is infinite.

The Upanishads are not supposed to have been revealed in the same manner as the Vedic hymns. See VEDA. Nevertheless, with the exception of a few confessedly modern Upanishads, they are not assigned to human authorship, but looked upon as inspired writings, to which the term *S'ruti* (q. v.) applies. In several Upanishads, no special mention is made of their divine origin; in some, however, this is done. Thus the *Chhândogya* Upanishad, in its concluding section, relates: 'This (knowledge of the soul) Brahman (the god of the Trimûrti) imparted to Prajâpati (a lord of creation—the patriarch Kas'yapa, as S'ankara explains); Prajâpati imparted it to Manu, and Manu to mankind;' the *Br'ihadâranyaka* Upanishad, which on three occasions gives long lists of teachers who handed it down to their pupils, always ascribes itself, in the last instance, to the authorship of 'the self-existent Brahman (the supreme spirit);' and in a similar manner the *Mun'd'aka* Upanishad says that it was Brahman (the god of the Trimûrti), the creator of the universe, who first taught the science of the supreme spirit to his eldest son, Atharvan. As in the case of most ancient works of Sanscrit literature, the date of the Upanishads also still remains quite uncertain, and, wherever given, is purely conjectural. According to the native system, they are classified as belonging to one or the other of the four Vedas, with which they are held to stand in immediate connection. There are Upanishads, consequently, of the R'ig-, Yajur-, Sâma-, and Atharvaveda. But this classification has no reference whatever to chronology.—For a fuller account of these works, see Professor Weber's *Indische Studien*, vols. i. ii. (Berlin, 1850—1853), and his *Akademische Vorlesungen über Indische Literaturgeschichte* (Berlin, 1852); Professor M. Müller's *History of Ancient Sanskrit Literature* (Lond. 1860); John Muir's *Original Sanskrit Texts*, vol. i.—iv. (Lond. 1858—1863); and the edition and translation of several of these Upanishads by E. Roer, *Râjendra Lâla Mitra*, and E. B. Cowell, in the *Bibliotheca Indica;* also Raja Rammohun Roy's *Translation of several Principal Books, Passages, and Texts of the Veds* (Lond. 1832). The names of 149 Upanishads, as compiled from various sources by Professor M. Müller, may be found in the *Zeitschrift der Deutschen Morgenländischen Gesellschaft*, vol. xix. p. 137, ff.

UPAPURÂN'A. See PURÂN'A.

U'PAS (the Malay word for *poison*) is the name given to a number of vegetable poisons in the Eastern Archipelago and the Philippine Islands. The most celebrated poison of this kind is produced by the *Antjar* (*Antiaris toxicaria*), a tree which grows in

Antjar (*Antiaris toxicaria*).

the Sunda and Philippine Islands. It attains a height of upwards of 100 feet, and belongs to the natural order ARTOCARPACEÆ (q. v.), the same order

with the bread-fruit. The leaves are lanceolate. The female flowers are solitary; the male flowers congregated beneath them in numbers upon the receptacle, which has a long stalk, and is of the shape of a watch-glass. The fruit is a kind of drupe, covered with fleshy scales. From the milky juice of this tree (called in some of the islands *Pohon-Upas*, *Antjar* in Java, and *Ipo* in the Philippines), mixed with black pepper, and the juice of galanga root and of ginger, the Malays prepare a poison for their arrows, which proves speedily fatal to men and to the larger mammalia. The only hope of relief is by means of severe vomitings and the excitement of profuse perspiration. Although the fresh juice of this tree, brought into contact with the skin, acts as a poison, the story of a poison-vale in Java, in which the exhalations of numerous poison-trees extinguish all animal life, and even all other vegetable life, is a mere fable. There is a narrow valley in Java where neither animal nor vegetable life can subsist; but this is owing to carbonic acid gas emitted from the ground, as in the *Grotto del Cane*, near Naples, and the upas-tree is as incapable of living there as any other. It is found in forests, and does no harm to the other trees around it. The prepared upas or antjar poison is kept in closed tubes of bamboo, and is of the consistence of molasses. The flesh of animals killed by this poison may be eaten with perfect safety; although the virulence of the poison is shewn by its extremely rapid action. It is not perfectly known what the substance is which gives to the juice of the upas tree its poisonous properties, but it appears to be an alkaloid. The fibre of the bark of the upas tree is sometimes made into cloth, but unless the fibre is thoroughly cleaned, garments made of it produce a painful itching.—A still more powerful poison than the upas antjar, employed in the same part of the world, is the *Upas Tjettek*, or *Upas Tieute*, which is prepared in a similar manner from the root of the *Strychnos tieute* (see STRYCHNOS). It abounds in strychnine.

UPHEA'VAL or UPTHROW OF STRATA, the change in stratified rocks from their original horizontal position to one more or less inclined, produced by an expansive subterranean force, or other power, like the pushing forward of the crust itself, as in the case of the Appalachian Mountains (q. v.). In slight changes of level, the continuity of the rock is unbroken; but frequently, immense cracks are formed, into which igneous rocks penetrate, and form a back-bone for the upraised mass, or dykes penetrating the strata. Upheavals may take place slowly, like the present gradual change in the Scandinavian coast, or may be more rapid when produced by some sudden earthquake.

UPHO'LSTERY, that branch of trade which relates to the furnishing of a house with curtains and other kinds of hangings. It is also applied more generally, and is made to include bedding, carpeting, and the covering of chairs, couches, &c.

UPOLU', one of the richest and most beautiful of the islands of the Pacific, belongs to the Samoan group, lying about 60 miles west of Tutuila. It is 140 miles in circumference, and has 16,000 inhabitants. The island has been a mission-station for many years, and the English consul is (1866) the son of Mr John Williams, the missionary, whose melancholy fate is well known. Many of the inhabitants are Christians. The chief harbour is Apia, a civilised-looking place, with many edifices on the European model. The principal trading establishment is that of the Hamburg consul, who, in 1862, exported 700 tons of cocoa-nut oil. Many of the natives are turning their attention to the cultivation of cotton, and the cotton-seed grows wherever it is cast on the ground; the only trouble experienced in raising cotton is the clearing and keeping down the weeds. In the year 1866, 200 acres were under this crop. The principal article of export, however, is cocoa-nut oil. In 1864, 91 vessels, of 10,291 tons, entered and cleared the port.

UPSA'LA, an ancient and beautiful town of Sweden, on the Fyrisä, a navigable stream, 45 miles north-north-west of Stockholm. The eastern part of the town stands on a wide and fertile plain; the west part, containing the chief buildings, occupies a high range of ground looking over an apparently boundless plain to the north and east. U. is the seat of an archbishop, who is the primate of the whole country. The great attraction is the cathedral, once a beautiful structure, and handsome still, though disfigured by restorations. It is in the Gothic style, built of brick, was founded in 1258, and completed 1435; is 330 feet long by 140 broad, and 105 feet high; and contains the tombs of Linnæus, and of Gustavus Vasa and several other Swedish kings. The university of U.—the chief institution of the kind in the country—was founded in 1477, and is attended by about 900 students, taught by 47 professors. The library contains 135,000 vols. and 7000 MSS., several of which are very valuable. Population, 20,000. the mass of whom are dependent upon the university for their livelihood. —Two miles north of the town is Old Upsala, now a village, which, during the heathen period, was the seat of the Odin worship, with a splendid temple and sacred grove, which have now disappeared. Also, about four miles from U. are the famous Mora-stones, where in the middle ages the election and crowning of the Swedish kings took place.

U'RACHUS, THE, in the adult human subject, is a small fibrous cord formed by the obliteration of a tubular canal, which in the embryo runs from the apex of the bladder to the umbilical cord. In other mammals, it remains open, and is continuous with one of the fœtal membranes; and it has been found pervious in the human subject at birth.

U'RAL, a river of Russia, called *Rimna* by the ancients, later, *Jaik*, and since 1775, by its present name, rises in the southern section of the Ural Mountains, near the east frontier of the government of Orenburg. It flows south through the district of Troitzk, past the town of Virchni-Uralsk, to its confluence with the Kisil; and in this region its course is over hilly meadows, and its current is very rapid, owing to its narrow and uneven bed. At the town of Orsk the river bends westward, and runs in that direction as far as the mouth of the river Tchagan, after which it flows directly south, and falls into the Caspian Sea. It is deep enough for navigation; but owing to the scarcity of wood for ship-building, and the number of sandbanks that bar the river, no navigation can be carried on. This loss, however, is compensated by the fisheries of the river, which abounds in the most highly esteemed varieties of fish, and yields to the Cossacks settled along its banks an annual revenue of 600,000 rubles (£93,750). The U. has long served as the frontier separating Russia from the Kirghis Steppes, and many forts have been erected, and a settlement of Cossacks—known as the Ural Cossacks—established along the river. The direct length of the U. is estimated at 550 miles; with windings, 1040 miles. The principal affluents are the Kisil and Sakmara on the right, and the Or and Ilek on the left.

URAL MOUNTAINS (probably the Tartar word *ural*, belt), the *Hyperborean Mountains*, or *Rhipæi Montes*, of the ancients, form part of the

boundary between Europe and Asia, and separate European Russia on the west from Siberia on the east. The chain extends south from the Kara Sea, an arm of the Arctic Ocean, to the middle course of the Ural river, or from lat. 70° to that of 50° N., and is 1333 miles in length, with a breadth varying from 16 to 66 miles. Although the U. M. form really a single uninterrupted chain, geographers have agreed to consider them as divided into three sections—the Northern, Middle, and Southern Ural. The Northern Ural separates the basins of the rivers Petchora and Ob, is for the most part rocky, does not rise higher than 3000 feet, and is commonly called *Poustoi* (empty), because it is extremely poor in ore. The Middle Ural, commonly called *Roudnoi* (metalliferous), the principal seat of the mineral riches of the whole chain, comprises the highest peaks, as the Kanjakovski Kamen, rising to 5000 feet; but in some places, the height is so insignificant, and the slope so gentle, that travellers can scarcely distinguish it from the lowlands. The Southern Ural divides itself into three branches, two of which extend to the east of the Ural river, and gradually disappear in the Uralo-Caspian deserts, while the third branch extends along the right—the western—bank of the Ural. The chain is composed chiefly of crystalline and metamorphic rocks, granite, gneiss, porphyry, chloritic, and micaceous schists. The U. M., especially the middle and the north part of the Southern Ural (the governments of Perm and Orenburg), abound in mines of gold, platinum, copper, and iron. These mines, or *zavods*, are partly the property of the state, partly that of private individuals. Of the latter, the chief are the Nijni-Tagilsk, belonging to the Demidoff family; the Verchisetsk and Neviansk, belonging to the Takosleff family. The gold diggings occur on the eastern slopes of the mountains, and gold is sometimes found in nuggets of considerable weight—the heaviest ever found in the chain being about 80 English lbs. in weight. In 1862, the amount of gold extracted from the U. M. was 185 poods 57 lbs. (6660 English lbs.). The platinum found is chiefly obtained from the Nijni-Tagilsk mines, and the amount obtained was 148 poods (5328 English lbs.). The richest copper ores in the U. M. are malachite and azurite; but the metal is extracted also from pyrites. The total amount found in 1862 was 248,865 poods (8,959,140 English lbs.). The amount of iron extracted in 1862 was 4,365,348 cwts., of which 2,778,400 cwts. were made into steel. The destruction of the forests has made the extraction of coal indispensable; but till 1866 the yearly amount was only 143,763 cwts., and none is exported. Among precious stones, the most notable are the emerald, found on the eastern slope in the district of Ekaterinburg, and some of which weigh 13 dwts. 9 grs. Other precious stones are found, as the beryl, topaz, amethyst, and diamond, the last discovered in accordance with the prediction of Humboldt, but of small value. Malachite and jasper also occur. The pop. inhabiting the U. M. and supported by the mines, is 135,000 inhabitants.

URA'LSK, a Russian town, belonging to the territory of the Ural Cossacks, and included within the governorship of Orenburg, stands on the right bank of the Ural, 150 miles south-south-east of Samara. It was founded in 1622 by the Ural Cossacks, and was till 1775 known under the name of Jaitsk. A good trade is carried on—the principal articles being fish, isinglass, caviare, tallow, and cattle. There are three great yearly fairs—in July, October, and January. Pop. 5000.

URA'NIA (i. e., 'the Heavenly Muse') was a daughter of Zeus and Mnemosyne. She was regarded as the Muse of Astronomy, and was represented with a celestial globe, to which she points with a little staff.

Urania.

URA'NIUM (symbol U, equiv. 120, sp. gr. 18·4) is a very hard, but moderately malleable metal, resembling nickel or iron in its lustre and colour; but in a finely comminuted state, occurring as a black powder. It is not oxidised by exposure to air or water at ordinary temperatures; but if heated in the air, it burns brilliantly, and is converted into oxide. It is a comparatively rare metal, which never occurs native; its sources being *Pitch-blende*, which contains nearly 80 per cent. of black oxide; *Uranite*, which contains a hydrated double phosphate of lime and uranium; and *Chalcolite*, which is a similar phosphate of copper and uranium. U. forms at least four oxides, viz., two principal ones—an *uranous oxide*, UO, and an *uranic oxide*, U_2O_3; and two intermediate oxides—the *black oxide*, U_4O_5, and the *green oxide*, U_3O_4. For the methods of preparing these oxides, the reader may consult any of the larger chemical text-books. The black oxide is of much value as a pigment for colouring porcelain; and compounds of the sesquioxide (or peroxide) with the earths are employed to communicate a peculiar yellow tint to glass. The salts of the protoxide have a green, and those of the peroxide a yellow colour. None of them are of any special importance. The metal is extracted from pitch-blende; and its isolation in a pure form is due to Peligot in 1841; Klaproth's supposed metal (which he discovered in 1789) turning out to be the protoxide. The metal was not obtained in the compact form till 1856.

URBAN, the name of eight popes, of whom the following deserve to be specially noticed. —URBAN II., a Frenchman by birth, and originally a monk of Clugny, was elected in a council held at Terracina, in the year 1088, during the schismatical pontificate of the anti-pope Guibert, styled Clement III. U.'s name was Otho, and he had been Bishop of Ostia. Soon after his election, he resumed possession of Rome, the fortresses of which had been occupied by the anti-pope, whom he compelled to withdraw. Guibert, nevertheless, was still supported by his patron, Henry IV. of Germany, who had long been at feud with the papal see; and U., in concert with the celebrated Countess Matilda, having formed a strong party in Italy, Henry once more led an army thither, and excited in Rome against the pope a party, whom he induced to recall Guibert—U. establishing himself at Anagni. The revolt of Conrad, the eldest son of Henry, against his father, and his coronation as emperor at Milan in 1093, and still more the successful appeal of Henry's queen, Adelaide, turned the tide of affairs in Italy. A great council was held at Piacenza in 1095, in which the anti-pope and his adherents were excommunicated. In the same council, the Crusade was proclaimed; and in the following autumn, U., in a council held at Clermont, made the well-known appeal on the same subject, which called forth that enthusiasm which was destined to lead to the long series of efforts for the recovery of the Holy Land, which forms so striking a characteristic of medieval history. In his later pontificate

U. pursued the same course, and in the end, succeeded in driving Henry IV. out of Italy The most important event of the last years of his pontificate was the holding of a council at Bari in 1098, in which many Greek bishops were present, and in which the addition of the words *filioque* to the Creed was discussed. Thence he returned to Rome, of which he obtained full and undisturbed possession; and he died in the close of 1099, just at the time when the first Crusade which he had organised terminated in the successful occupation of Jerusalem.—URBAN V. (originally William de Grimoard) is remarkable as practically the last of the popes who resided at Avignon, and the one by whom the papal seat was for a time re-transferred to Rome. He was a native of France, and had been Abbot of St Victor at Marseille. On the death of Innocent VI. in 1362, he was elected at Avignon, where he continued to reside, sending his legate, Cardinal Gil de Albornoz, to reduce the rebellious subjects of the papal see in Rome. After various alternations of peace and contest, U. took the resolve of returning in person to the ancient seat of the papacy. He set out in 1367; and landing at Corneto, proceeded first to Viterbo, and in the end to Rome, which he reached in October 1367. He found the papal city in a condition all but ruinous, and the whole of Italy overrun by bands of mercenaries, and a prey to intestine divisions of the worst character. He endeavoured, in concert with the queen of Naples, Joanna, in the following year, and of the Emperor Charles IV., to repress these disorders, but with little success; and in 1370, he resolved once again to repeat the experiment of a withdrawal of the papal residence from Rome. He set out in September of that year; but only outlived his return to Avignon by a few weeks, and died in December 1370, leaving the reputation of great personal piety, disinterestedness, and zeal for the interests of religion and morality.—URBAN VI. deserves a special notice, as being the pope under whom the great Western Schism had its origin. His name was Bartolomeo Prignano, and at the time of his election he was Archbishop of Bari. On the death of Gregory XI. (1378), who had finally returned from Avignon to Rome, and died in that city, Prignano was elected in a conclave held at Rome under circumstances of great excitement, owing to the apprehension, on the part of the populace, of an intention to elect a French pope, and again abandon Rome. The cardinals in the conclave numbered 16, of whom 12 were French, and 4 Italians. Prignano, although not a cardinal, was elected, April 8, 1378; and after the election had been made, the populace having broken into the hall, the cardinals dispersed; on the following day, however, they returned, confirmed the election, Prignano assuming the title of Urban VI., under which name he was crowned, April 18, in the presence of the 16 cardinals. In July of the same year, the 12 French cardinals assembled at Anagni, and revoked the election of U., in which they declared that they had been acting under the fear of violence. To this course they are said to have been led by the rigour and the intemperate severity with which U. was proceeding in the reforms of discipline, and especially of the simony and the irregular life of the clergy, including the cardinals themselves. They were joined by three of the Italian cardinals (one of them having died). On the 20th September, they proceeded to elect the cardinal bishop of Cambray (born Count of Geneva) pope, under the name of Clement VII. Clement took up his residence at Avignon. U., on the contrary, remained at Rome, where he appointed 26 new cardinals, and excommunicated Clement and his adherents. This conflict of claims was the origin of the WESTERN SCHISM (q. v.). U. was recognised as the lawful pope by one portion of the West, Clement by the other, and each maintained his claim by measures of the most extreme character. U. especially, although his title seems to have been best founded, weakened his cause by his excessive violence. Having engaged in a dispute with Charles, king of Naples, whom he had himself crowned, he was besieged by that prince at Novara, whence he withdrew to Genoa, taking with him, as prisoners, the cardinals of his party with whom he had quarrelled, and several of whom he is said to have put to death. In 1389, while he was on his way to Ferentino, he fell from his horse, and having been conveyed to Rome, died from the injuries thus sustained in October of that year. —URBAN VIII. was the successor of Gregory XV. His family name was Maffeo Barberini. He was born at Florence in 1568; and after a long series of brilliant services, both in the domestic administration and in foreign nunciatures, he was elected pope in September 1623. In the difficult position of Roman affairs, as complicated between France, Austria, and Spain, in the war of the Valtellina, to which he succeeded on his first election, he acquitted himself with much dexterity. His pontificate was also signalised by the acquisition to the Holy See of the duchy of Urbino (q. v.) in 1626. U. died in 1644. His memory has suffered through the imputation of nepotism; but his administration was, on the whole, vigorous and enlightened. He was the founder of the celebrated college of the Propaganda, and to him Rome is indebted for many public works, including large and important additions to the Vatican Library. Some of the early stages of the Jansenist controversy (q. v.) fall within this pontificate.

URBI ET ORBI (Lat. to the city and the world), a form used in the publication of papal bulls, for the purpose of signifying their formal promulgation to the entire Catholic world, as well as to the city of Rome. By the canon law, one of the conditions required in order that any new law shall be held to have force is 'promulgation;' but a very celebrated controversy arose in the 17th c. as to the kind of promulgation which should be regarded as sufficient. In ancient times, the practice of the popes had been to send copies of their bulls to the primates, metropolitans, and other ecclesiastical heads of the several churches, to be by them communicated to their suffragan bishops; but in progress of time, the practice of publicly proclaiming or of posting up the decree in the Campo dei Fiori in Rome was substituted for this transmission; and decrees addressed URBI ET ORBI, and published in this way, were held to be thus sufficiently promulgated to the various churches, and to be thenceforth of full force. The French jurists of the 17th c. strenuously controverted this view. The controversy is of little importance, even in the Roman Catholic Church, in these days of universal publicity and of rapid and simultaneous diffusion of intelligence.

URBINO, in Central Italy, capital of the province of Urbino and Pesaro, situated 20 miles south-west of Pesaro, and between the rivers Metauro and Foglia. Its walls date from the 14th c.; it has a magnificent palace, once the residence of the Dukes of Urbino, where was the famous library of the Della Rovere family, afterwards removed to the Vatican. Another handsome palace is that of the Albini, belonging to an Albanian family escaped from the ferocity of the Turks, and subsequently settled in U., where they became rich and powerful, and gave a pope to the church, who took the name of Clement XI. U. is an archiepiscopal see. Its

manufactures are unimportant, except a pin-factory. It is the birthplace of Raphael. Pop. 15,444. U. was a *municipium* under the Romans, and during the middle ages became the seat of a race of independent dukes, who existed up to 1626, when, on the death of Francesco, the last duke, Urban VIII. took possession of the duchy as a vacant fief; and it continued to form part of the papal states till 1860, when it became part of the kingdom of Italy.

U'RCHIN, SEA. See ECHINIDÆ.

URE, ANDREW, M.D., a distinguished chemist, was born at Glasgow in 1778, educated at Glasgow University, subsequently prosecuted his medical studies at Edinburgh, and returned to Glasgow, where he received the degree of M.D. in 1801. In 1802, he became Professor of Chemistry and Natural Philosophy in the Andersonian Institution (q. v.), took an active part in the establishment (1809) of an observatory at Glasgow, and was appointed its first astronomer. In 1813, he made his appearance in the literary world as the author of a *Systematic Table of the Materia Medica*, which was followed in 1818 by *New Experimental Researches on some of the Leading Doctrines of Caloric*, a memoir which, read before the Royal Society, and printed in the *Philosophical Transactions*, brought U. prominently into notice as a natural philosopher. Several papers on chemical subjects, the fruits of his accurate and extensive researches, followed. In 1821, appeared his *Dictionary of Chemistry;* in 1822, a paper *On the Ultimate Analysis of Animal and Vegetable Substances*, one of the earliest contributions to organic analysis, and a translation of Berthollet on *Dyeing;* and in 1829, a *System of Geology*, in which the hypothesis of a general Flood was maintained. In 1830, U. removed to London, and in 1834 was appointed analytical chemist to the Board of Customs. The products of his pen from this time assume more of a technological character, as the *Philosophy of Manufactures* (1835), *The Cotton Manufacture of Great Britain compared with that of other Countries* (1836), and *Dictionary of Arts, Manufactures, and Mines* (1839). A second edition of this last work was published in 1853, and a revised and enlarged one in America in 1863. U. was chosen a Fellow of the Royal Society in 1822, as well as of the Geological, Astronomical, and other societies at home and abroad. He died in London, 2d January, 1857.

URE'A (COH_4N_2) is an organic matter which derives its name from its having been originally discovered in the urine, of which it forms the most important and characteristic ingredient. It was until recently regarded as an organic base or alkaloid; but during the last few years it has been placed amongst the *amides*, a group of neutral, and for the most part crystallisable compounds, of the *ammonia type* (see TYPES, CHEMICAL), in which one of the three equivalents of hydrogen is replaced by the radical of an organic acid. For example, if R represent the radical, $\left.\begin{matrix}R\\H\\H\end{matrix}\right\}N$ represents the corresponding amide; and the character of the type is not affected by doubling the entire number of molecules, or changing it into $\left.\begin{matrix}R_2\\H_2\\H_2\end{matrix}\right\}N_2$. Now, if in this formula we substitute CO (carbonic oxide, or carbonyl, as it is now often termed) for R_2, we obtain $\left.\begin{matrix}CO\\H_2\\H_2\end{matrix}\right\}N_2$, which is identical with COH_4N_2, and possesses the advantage of showing the probable grouping of the elements in urea. Pure urea, which has been allowed to crystallise slowly, occurs in white, glistening, streaked, four-sided prisms; but when the crystallisation is rapid or disturbed, it separates in small white silky needles. It is devoid of smell, has a coolish bitter taste, like that of saltpetre (which it closely resembles in its external form), and is very slightly deliquescent. It is readily soluble in water and alcohol, but only slightly in ether. When heated to about 248°, it fuses, evolves ammonia, and becomes completely decomposed. A solution of pure urea in distilled water may be kept for a long time, and may even be boiled without undergoing decomposition; but if heated in a closed tube to about 284°, each equivalent combines with four of water, and is converted into carbonic anhydride and ammonia, according to the formula.

$$\overbrace{COH_4N_2}^{\text{Urea.}} + \overbrace{H_2O}^{\text{Water.}} = \overbrace{CO_2}^{\text{Carb. Anhyd.}} + \overbrace{2NH_3}^{\text{Ammonia.}}$$

A similar change takes place slowly at ordinary temperatures in the urea contained in the urine, the mucus of the bladder acting as a ferment, and thus rendering urine ammoniacal after it has been kept for a few days.

The following are some of the most important of the compounds of urea. *Nitrate of urea* ($COH_4N_2.HNO_3$) and *oxalate of urea* ($2COH_4N_2.C_2O_4H_2$) are readily crystallisable salts, formed by the direct addition of the respective acids to a moderately strong solution of urea. As nitrate of urea requires eight parts of cold water, and is still more insoluble if an excess of free nitric acid is present, and the oxalate is more insoluble than the nitrate, while urea dissolves in its own weight of water, these salts may be employed to test for, and approximately determine, the quantity of urea. Amongst the compounds of urea with metallic oxides, those which it forms with the oxides of mercury are especially interesting, and have been completely examined by Liebig. A result of his researches is his celebrated method, which is now in universal use, for determining the amount of urea volumetrically.

Urea occurs as the main and characteristic ingredient of the urine of man and mammals, being most abundant in that of carnivorous, and least so in that of vegetable feeders. The average quantity excreted by the human subject is mentioned in the article URINE. It is also a constituent of the fluids of the eye, of the sweat, and (in minute quantity) of the blood, and of the liquor amnii (of the fœtus). There can be no doubt that it is a final product of the regressive metamorphosis of the living tissues, or of their disintegration into simpler compounds, by means of which the final elimination of the worn-out structures is facilitated. Thus, we find that urea may be obtained by oxidising agents from uric acid, creatin, allantoin, &c., in the laboratory, and there is every reason to suppose that similar changes may occur in the system. Whether, when an excess of food is taken, a portion of it may be formed in the blood into urea, and then at once separated without ever having entered into the structure of the higher tissues, is a point which is scarcely decided.

Until the discovery by Liebig and Wöhler of the artificial formation of urea, its only source was the urine, from which, after evaporation, the nitrate was separated, purified by animal charcoal, and the urea liberated by the addition of carbonate of baryta, and finally extracted by alcohol, from which it was allowed to crystallise. It is now known that there are many different ways of forming it, as (1) by the action of oxychloride of carbon or phosgene gas $(Co)_2Cl_2$ on dry ammonia; or (2) by heating a mixture of carbonic ether $(2(C_2H_5)CO_3)$ and an alcoholic solution of ammonia to about 356° in a closed tube (both of which shew that urea exhibits some of the

properties of an *amide;* but the best practical method is essentially the original one of mixing watery solutions of cyanate of potassium and sulphate of ammonium, and evaporating the solution, which leaves a residue consisting of urea and sulphate of potassium, the former of which may be extracted by alcohol.

URE'AS, THE COMPOUND, include a large class of singular organic bodies, for the knowledge of which chemistry is mainly indebted to Professor Hofmann. Compounds of this kind are most readily formed by the action of cyanic acid on the amide or amidogen bases of the alcohol radicals, such as methylamine, ethylamine, &c. (the methylia, &c., of Miller and other chemists), instead of on ammonias. Thus, while ordinary urea is formed by the action of this acid on ammonia, methyl-urea, ethyl-urea, &c., are formed by its action on methylamine, ethylamine, &c., as shewn in the following formula:

$$\underbrace{H_3N}_{\text{Ammonia.}} + \underbrace{HNCO}_{\text{Cyanic Acid.}} = \underbrace{COH_4N_2}_{\text{Urea.}}$$

$$\underbrace{CH_5N}_{\text{Methylamine.}} + \underbrace{HNCO}_{\text{Cyanic Acid.}} = \underbrace{C_2H_7N_3}_{\text{Methyl-urea.}}$$

$$\underbrace{C_2H_7N}_{\text{Ethylamine.}} + \underbrace{HNCO}_{\text{Cyanic Acid.}} = \underbrace{C_3H_8N_2O}_{\text{Ethyl-urea.}}$$

These are the simplest forms of these compounds; amongst the more complicated ones are ethyl-methyl-urea, $C_4H_{10}N_2O$, phenyl-ethyl-urea, $C_9H_{12}N_2O$, &c. All these compound ureas combine like ordinary urea with acids, and form crystallisable salts.

URE'DO, a genus of minute parasitic fungi, of the order *Coniomycetes.* The original genus U. has been divided into many genera, forming a group called *Uredineæ,* which contains a multitude of species, parasitic on phanerogamous plants of almost every natural order, and in all parts of the world, at the equator and at the extreme limits of arctic and antarctic vegetation. Different plants have their own peculiar parasites of this kind, or the same *Uredineæ* are at least confined to plants nearly allied. A few species occur on ferns, but not very frequently. Every external part of plants, except the roots, is liable to be infested with these fungi, and some of them attack the inner tissues, their spores at length breaking through the outer strata of cells. Submerged parts of plants are never affected by them, for fungi dislike water; but the floating portions of aquatic plants are not exempt; and in all cases a moist atmosphere seems to be favourable to their development. Rank luxuriance of growth is often attended by their appearance. A plant once attacked is afterwards subject, if perennial, to the same parasite, even if removed to another situation. There is reason to believe, from experiments made by Fée, that the spores of the *Uredineæ* are taken up by the roots of plants from the soil, and find their way with the sap to the place proper for their growth. See BRAND, BUNT, MILDEW, RUST, and SMUT.

URE'NA, a genus of herbaceous plants of the natural order *Malvaceæ.* The bark is very fibrous; and the fibre of *U. lobata* and *U. sinuata,* weeds common in most parts of India, is used as a substitute for flax. It is strong, and tolerably fine.

U'RETERS (Gr. *ouron,* urine, and *tērein,* to keep), the canals by which the urine is conveyed from the pelvis of the kidney (see KIDNEYS) on either side to the base of the bladder. Each ureter is about eighteen inches in length, and enters the bladder in so slanting a direction as to prevent regurgitation.

When a concretion is formed in the kidney, the ordinary and most favourable event is that it should descend through the ureter to the bladder. The passage of a stone through this tube gives rise to a series of violent symptoms, which are thus summed up by Druitt: 'The patient complains of sudden and most severe pain, first in the loins and groin, subsequently in the testes (in the male) under the thigh. The testes are also retracted spasmodically. At the same time, there are violent sickness, faintness, and collapse, which may last two or three days, and are only relieved when the stone reaches the bladder.'—*The Surgeon's Vade-mecum,* 8th ed. p. 594. The treatment consists in the warm bath, and the inhalation of chloroform, or opium in large doses (both of which serve to allay spasm and deaden pain), the free use of diluents to wash down the concretion, and if the sickness is very severe, an occasional tumbler of hot water containing half a tea-spoonful of carbonate of soda.

URE'THRA is the term given in Anatomy to the canal by which the urine is discharged from the bladder. Its most common affections are the special inflammatory condition of its mucous lining, known as Gonorrhœa (q. v.), and Stricture (q. v.).

U'RFA, or ORFA, the modern name of EDESSA (q. v.).

U'RGA, a town of Mongolia, on the river Tola-stands in a valley, at the height of 4100 feet above sea-level, 350 miles south-east of Irkutsk. In one of the suburbs of the town is a college of Mongolian priests, which is the seat of the Lama of the Mongols. See LAMAISM. The college or convent covers an extensive area, and includes the dwellings of the priests. The population is made up of a colony of Chinese and about 25,000 Mongols, 10,000 of whom are priests. Each family educates one of its children to be a priest. The buildings of the college have of themselves more the appearance of a town than the other quarters of Urga. The number of the inhabitants is not stated.

U'RI, one of the Waldstädten or Forest Cantons of Switzerland, forms part of the Hill Country (see SWITZERLAND) which surrounds the Lake of Lucerne, and is bounded on the west by the cantons of Unterwalden, Bern, and Valais. It has an area of 418 sq. m., and its pop. in 1850 was 14,505; in 1880, 23,694. It consists of one valley, that of the Reuss, about 30 miles in length, and enclosed on all sides by lofty mountain chains, which also include the south-eastern bay or reach of the lake into which the river falls. A great high-road passes through the valley, and terminates on the south at the St Gothard Pass, which connects the Uri with Ticino, and forms part of one of the great routes into Italy. Uri is almost entirely pastoral, and its products are those of its herds and flocks. Goats are very numerous. In the low grounds, there are a few fields of corn and potatoes, and gardens and orchards, but even this cultivation is limited. The population speak a Swiss-German dialect, and are Roman Catholic. Uri is a democracy. The landesgemeinde, held in a meadow once a year, is formed of the whole male population who have reached 20 years of age. The highest power resides in this assembly. The preconsideration and superintendence of the law belongs to the *landrath,* which consists of 7 members chosen by the landesgemeinde, and 61 by the several communes. A governing council of 11 members, with the landamman as president, discharges executive functions. Civil justice is administered in the

highest instance by a cantonal court of 11 members. A tribunal of 7 members decides in criminal causes. Altorf, the capital, is a small town, with less than 2000 inhabitants. A fountain surrounded by stone statues of Tell (q. v.) and his son marks, according to tradition, the spot where the former stood to take his aim, and another that where the boy stood with the apple on his head.

U'RIC or LITHIC ACID ($C_5H_4N_4O_3$) derives its names from its being a constituent of urine and of urinary calculi respectively. In a state of purity, it occurs in the form of a loose white powder or scales consisting of minute crystals, devoid of smell or taste, only very slightly soluble in water (1 part requiring about 15,000 parts of cold, and 1800 of boiling water), and quite insoluble in alcohol and ether. This acid is, however, soluble without decomposition in strong sulphuric acid, and it may be thrown down from this solution by the addition of water. It is also soluble in the carbonates, borates, phosphates, lactates, and acetates of the alkalies, extracting from these salts a part of their base, with which it forms acid urates. Litmus paper is reddened by its moist crystals, or by a hot watery solution. This acid is not volatile, and by dry distillation is decomposed into carbonate of ammonium, urea, cyanuric acid, hydrocyanic acid, &c. On treating a mixture of uric acid and water with gradual additions of peroxide of lead, which is a strong oxidising agent, the uric acid becomes oxidised, takes up water, and becomes converted into allantoin with the production of carbonate of lead, as is shewn by the equation:

$$\overbrace{C_5H_4N_4O_3}^{\text{Uric Acid.}} + \overbrace{H_2O}^{\text{Water.}} + \overbrace{Pb_2O}^{\text{Oxide of Lead.}} =$$

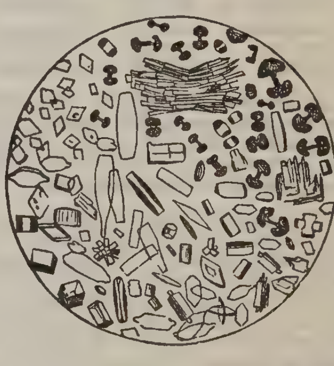
$$\overbrace{CH_4N_2O}^{\text{Urea.}} + \overbrace{C_4H_6N_4O_3}^{\text{Allantoin.}} + \overbrace{CPb_2O_3}^{\text{Carb. of Lead.}}$$

An excess of peroxide of lead in hot solutions of uric acid thus treated converts the allantoin into urea with the formation of oxalic acid. This is a most important result in its physiological bearing, since it shews how uric acid is a probable stage towards the formation of urea, and as explaining a probable source of the oxalic acid, which is often present in the urine in cases of deficient respiration and aëration; and this view is confirmed by the experiment of introducing uric acid into the stomach or veins of an animal, when the presence of oxalate of lime, and the augmentation of urea, are very soon perceived in the urine.

Uric acid is a very weak bibasic acid, forming with bases two series of salts, the neutral and the acid, of which the former are the more soluble. Amongst the most important of these urates are—(1.) *Neutral Urate of Potassium*, which occurs in the form of a white granular crystalline powder, difficult of solution in water (requiring 44 parts of cold, and 35 of boiling water), but readily soluble in an excess of potassium, from which solution carbonic acid throws down the *Acid Urate of Potassium* in the form of a transparent jelly, which sometimes falls in the form of a powder; (2.) Two *Urates of Sodium*, each of which is less soluble than the corresponding potash salt; (3.) *Acid Urate of Ammonium*; (4.) *Acid Urate of Magnesium*; (5.) two *Urates of Lime*; and (6.) *Urate of Lithium*, which is more soluble than any other urate; and hence lithia water is an important therapeutic agent in converting uric acid and the more insoluble urates into a soluble salt in the living body.

Uric acid is widely distributed throughout the animal organism. It occurs not only in the urine of man and carnivorous animals, but is the chief constituent (either free or in combination) of many calculi occurring in the kidneys or bladder, and of numerous urinary sediments. The urinary secretion of birds and reptiles consists almost entirely of urates, which are also found in the excrements of caterpillars, butterflies, beetles, &c., and of many molluscs. Moreover, in very minute quantities, it occurs as a urate in healthy blood, in which fluid it has been found in excess in gout and Bright's disease, and is a constituent of the aqueous extract of the spleen, liver, lungs, pancreas, and brain. The *chalkstones* occurring about the smaller joints, and in the lobes of the ear of gouty patients, consist mainly of urate of sodium.

The best and most ready mode of obtaining pure uric acid is from the semi-solid urine of serpents, which consists almost entirely of urates. The mass is boiled with potash, which expels any ammonia that is present, and a stream of carbonic acid is then passed through the strained potash solution, which throws down acid urate of potassium. This precipitate is dissolved in water, and decomposed by hydrochloric acid, which throws down the uric acid in minute crystals. The form in which this acid crystallises is liable to great variations, as may be seen in the accompanying figure. Sometimes we



Magnified view of Uric Acid in different forms:

The dumb-bell shaped forms seen in upper part of the figure were formerly supposed to consist of oxalate of lime. It has recently been shewn that they are a form of uric acid crystal.

have flat tablets resembling whetstones, or sections with a double knife through biconvex lenses; at other times, more or less perfect rhombic tablets, and sometimes hexagonal plates, barrel-shaped prisms, and toothed crystals. If there is any doubt as to the nature of the crystals, they should be dissolved (under the microscope) in a little potash solution, and a drop of hydrochloric acid then added, when sufficiently characteristic forms are sure to appear.

The marvellous researches of Wöhler and Liebig on the products of decomposition of uric acid by nitric acid, constitute an epoch in organic chemistry. The most important products, some of which are obtained directly, and others indirectly, are: (1.) *Alloxan*, $C_4H_2N_2O_4$ (which, under the influence of various reagents, yields *alloxanic acid, mesoxalic acid, mykomelinic acid*, and *dialuric acid*); (2.) *Parabanic acid*, $C_3H_2N_2O_3$ (which yields *oxaluric acid*); (3.) *Alloxantin*, $C_8H_4N_4O_7$ (which yields *alloxan, allituric acid, uramel, thionuric acid, oxaluric acid*, and *murexide*); (4.) *Murexide*, $C_8H_8N_6O_6$ (which yields *murexan*, or *uramel*, and *alloxan*); and (5.) *Urea*, which breaks up into carbonic acid and ammonia. Moreover, by boiling oxaluric acid with water it is decomposed into oxalic acid and urea. Of these substances, we

shall only notice *murexide*, which has two special claims to notice. It is used as a pigment in dyeing, being probably the old *Tyrian Purple* (see MUREXIDE), and it affords a ready test for a mere trace of uric acid. In using it for the latter purpose, the substance supposed to contain uric acid is heated on a slip of glass with a drop of nitric acid, and carefully evaporated to dryness. If uric acid is present, the residue has a red colour, which is converted by vapour of ammonia into a fine crimson, and the addition of a drop of a solution of potash develops a splendid purple tint, which disappears on the application of heat.

Uric acid must be regarded, like urea, as a product of the disintegration of the tissues; and it is far from improbable that all the urea which is secreted may have pre-existed in the form of uric acid—a view which is supported by the fact, that whatever increases the amount of urea, decreases that of uric acid, and *vice versâ*. See URINE.

URICONIUM. See SUPPLEMENT in Vol. X.

U'RIM AND THU'MMIM (Heb.), a mysterious contrivance in or on the High-Priest's breast-plate, either consisting of the four rows of precious stones upon which the names of the 12 tribes were engraved, or of two images personifying—most probably—'Truth' and 'Revelation.' Luther's translation, 'Light and Truth,' has no more real foundation than that of the LXX. and the Vulgate, which is 'Utterance and Truth.' To this translation, the fact of the picture of 'Truth' (Aletheia)—in sapphire or other precious stones—being suspended from the Egyptian high-priest's breast, had probably given rise. The etymology of the two words, which, derived from Arabic roots, would indicate 'Brilliant Amulet,' 'Perfect Light,' &c., is in reality no more satisfactory than the account of the manner in which the contrivance was used for oracular purposes, or of the time when, in reality, it ceased to act. It is never mentioned after Solomon's time.

U'RINARY SEDIMENTS is a general term which includes all those substances which occur in a non-dissolved state in the urine. Most of these sediments are not formed until after the urine has been discharged and has cooled; some, however, are formed in the urinary organs, and under favouring conditions may give rise to urinary concretions. Hence it is a point of importance to ascertain whether a sediment occurring in a specimen of fresh urine has been formed before or after its discharge.

The chemical and microscopical characters of these sediments has a double bearing on the detection of disease: (1.) 'From the investigation of these sediments,' says Professor Vogel, 'we can draw sure conclusions regarding special changes that are going on in the general nutrition of the body. They shew us that an excessive quantity of certain substances (as, for example, uric, hippuric, or oxalic acid) is being discharged with the urine, and has therefore been produced in the body; and we thus often obtain at a glance information of great importance, which could otherwise only be procured by a tedious process; and (2.) they point out to us certain local diseases of the urinary system. Thus, from a sediment containing pus, we infer that suppuration is going on in some part of that system; and the presence of cylindrical casts or tubes in the sediment informs us of certain morbid changes in the structure of the kidneys; and if the ordinary symptoms reveal the presence of stone in the bladder, we can ascertain its probable nature from the character of the sediment or gravel.'

The mode of formation of morbid sediments is well illustrated by a sketch of the changes which healthy urine undergoes after prolonged exposure to the air. In the course of two or three days, the acidity of the urine is found to have increased, and this condition of *acid fermentation* will frequently continue for some weeks, giving rise to the deposition of (1.) free uric acid; (2.) acid urates (chiefly urate of sodium); and (3.) oxalate of lime. In a few weeks, or often much sooner, the urea becomes alkaline, or *alkaline fermentation* is established, in consequence of the urea being converted into carbonate of ammonium. The urine now becomes paler, while the red or yellow crystals of uric acid are replaced by white amorphous granules and colourless refracting prismatic crystals. In other words, the former precipitate is replaced by (1.) phosphate of ammonium and magnesium (commonly known as triple phosphate); (2.) phosphate of lime;

Fig. 1.

Magnified urinary sediment, consisting of uric acid, urate of soda, and oxalate of lime; from a person convalescent from typhus fever. The uric acid crystals are here chiefly seen in large dense bundles, joined two and two by their bases, each bundle being composed of an enormous number of the long whetstone crystals described and figured in the article URIC ACID (q. v.). The dark crystals with light cross-bars are composed of oxalate of lime; while the dark-coloured granules occurring either singly or in masses are urate of soda.

and (3.) urate of ammonia. In certain forms of disease, these changes take place much more rapidly, and the second change—the alkaline fermentation—may

Fig. 2.

Magnified urinary sediment, consisting of large prismatic crystals of triple phosphate (or phosphate of ammonium and magnesium), and globular bodies often studded with points, which consist of urate of ammonium; from the alkaline urine of a patient suffering from paraplegia, consequent on disease of the spinal cord.

occur without a pre-existing acid fermentation, and even within the bladder. The general characters of the deposits occurring as results of the acid and of

the alkaline fermentations are shewn in figs. 1 and 2. In addition to the above-named substances, which arise from the decomposition of healthy urine, others occur in various morbid conditions of the system; and we may divide the urinary sediments generally into the two great groups of (1.) the unorganised and (2.) the organised deposits. The unorganised sediments include uric acid, the urates (chiefly urate of soda), hippuric acid, oxalate of lime, earthy phosphates (viz., phosphate of lime, and triple phosphate), cystine, xanthine, hypoxanthine (formerly known as guanine), and tyrosine; while the organised sediments include mucus and epithelial scales, blood corpuscles, pus corpuscles, cancerous and tubercular matter, fibrinous casts of the tubes of the kidney, spermatozoa, fungi, infusoria, &c. Of the unorganised sediments, uric acid, the urates (excepting urate of ammonia), hippuric acid, and cystine occur only in acid urine; and urate of ammonia, triple phosphate, and phosphate of lime, in alkaline or neutral urine. Oxalate of lime and the organised sediments occur both in acid and alkaline urine; but alkaline urine is the more natural *habitat* for fungi and infusoria. It is comparatively seldom that a sediment consists of a single ingredient. The crystaline forms of two mixed sediments, one consisting of uric acid, urate of sodium, and oxalate of lime, and the other of triple phosphate and urate of ammonium, as seen under the microscope, are shewn in figs. 1 and 2 respectively. Most of our knowledge on this important subject is due to the labours of English physicians, amongst whom the names of Prout and Golding Bird are especially deserving of notice. For details regarding the mode of treatment suitable in the most important of the sediments, we may refer to the articles LITHIC ACID DIATHESIS, OXALURIA, and PHOSPHATIC DIATHESIS, in this work, and to Dr G. Bird's *Urinary Deposits and their Treatment;* while for details regarding their chemical and microscopical characters, Neubauer and Vogel, *On the Urine*, translated under the auspices of the New Sydenham Society, may be consulted.

U'RINE is the fluid which is secreted or separated by the kidneys from the blood, and it is the principal means of removing the worn-out tissues, especially the nitrogenous and saline matters, from the system. It is a very complex fluid, and its composition varies considerably in different classes of animals, and mainly in accordance with the nature of the food.

Healthy human urine, when freshly discharged, is a clear fluid of a bright amber colour, a bitter, saltish taste, and a peculiar aromatic odour. Its normal reaction is acid, and its specific gravity ranges from 1·015 to 1·025. From a table published in Day's *Physiological Chemistry*, p. 352, it appears that an adult man of ordinary weight (about eleven stones) secretes in 24 hours about 52 fluid ounces (or rather more than two pints and a half) of urine, the range extending from 40 to 70 ounces; and that these 52 ounces yield, on evaporation, 935 grains of solid constituents, the remainder being water, which is expelled by heat. Of these 935 grains, 520 (or more than an ounce) are composed of Urea (q. v.), and 266 of chloride of sodium (or common salt); while the remaining 149 grains are made up of Uric Acid (q. v.), Hippuric Acid (q. v.), sulphuric acid, 32 grains; phosphoric acid, 54 grains; earthy phosphates, 15 grains; ammonia (in the form of hydrochlorate), 11 grains; with smaller quantities (in most cases mere traces) of Creatinine (q. v.) and Creatine (q. v.), xanthine, hypoxanthine, colouring matters, mucus (from the walls of the bladder), iron, silica, and fluorine. The fluid also holds an undetermined quantity of gases (carbonic acid and a little nitrogen) in solution. The most characteristic and important of these ingredients is the *urea*, the daily excretion of which is modified by various circumstances. On a purely animal diet, Lehmann found that he secreted two-fifths more urea than when he was living on an ordinary mixed diet; while on a mixed diet there was secreted almost one-third more than on a purely vegetable diet; while finally, on a non-nitrogenous diet, the amount of urea was less than half the quantity secreted during a mixed diet. The free use of common salt increases the daily excretion of urea, in consequence, doubtless, of its augmenting the rapidity of the destructive action always going on in all the tissues; while alcohol, tea, coffee, and tobacco (whether smoked or chewed) diminish the daily quantity. The only medicine which increases its quantity to any marked degree is *Liquor Potassæ.* The daily quantity is increased in many diseases (typhoid fever and many other acute diseases, especially inflammation of the membranes of the brain), while in Bright's Disease and a few other disorders, it is diminished. The daily amount of excreted *uric acid*, like that of urea, varies with the nature of the food. Thus, for instance, Professor Haughton found that the mean daily quantity of uric acid excreted by meat-eaters and wine-drinkers was 4·5 grains, while vegetarians yielded an average of only 1·48 grains, part of which, moreover, was hippuric acid. As an excess of uric acid is likely to give rise to gravel or stone, it should be generally known that the free ingestion of water diminishes its excretion, while at the same time it increases the amount of urea, into which the uric acid is probably transformed by oxidation. The daily amount is diminished by strong bodily exercise, and increased by repose; the reverse of what holds good in relation to the urea. The amount is increased when the digestive functions are disturbed, as after the use of indigestible food or excess of alcoholic drinks; in those conditions of the system which are associated with much disturbance of the functions of respiration and circulation; and in disorders accompanied with severe febrile symptoms, such as acute rheumatism. Its entire absence seems compatible with perfect health. With regard to *hippuric* acid, there has been much discussion, not only as to the quantity in which it occurs, but as to whether it actually exists in healthy urine. Thus, Weissman, a German chemist, finds that on a mixed diet he secreted more than 40 grains of this acid daily, and on a purely animal diet, only 12 grains. Duchek and Höfle deny that it is a constant ingredient of healthy human urine; and Professor Haughton only met with it once in the urine of ten men. Dr Bence Jones, a very trustworthy chemist, found that a man, A, weighing 152 lbs., and a man, B, weighing 202 lbs., living on a mixed diet, excreted daily, on an average, 4·9 and 6·5 grains of hippuric acid, the corresponding quantities of uric acid being 7·7 and 12·6 grains. In cases of jaundice, no traces of hippuric acid are present, even after the administration of benzoic acid,* which is usually converted in the system into hippuric acid. Hence it may be inferred that a healthy condition of the urine is essential to the formation of this acid in the system. Nothing is known with certainty regarding the diseases in

* Duchek found that when 1 gramme (15·44 grains of benzoic acid was taken, 0·714 of a gramme of hippuric acid was excreted; when 2 grammes were taken 1·857 grammes of hippuric acid, and 0·421 of benzoic acid, were excreted; and the ingestion of 4 grammes was followed by the excretion of 1·714 of hippuric acid and 2·500 of benzoic acid. Hence the limit of conversion had been already exceeded.

which this acid is secreted to excess. The only other characteristic ingredient of the urine is its *colouring matter*. Professor Harley believes that he has isolated the normal urine-pigment, to which he applies the term *urohæmatin;* and from its always containing iron, and on other grounds, he regards it as modified hæmatin or blood-pigment. Mr Schunck has also shewn that indigo-blue, in very small quantity, is almost always present.*

It has been already stated that fresh healthy human urine presents an acid reaction. This reaction mainly depends upon the presence of acid phosphates of the alkalies and earths, although the presence of free acids, such as free hippuric, or possibly lactic acid (which, however, is not a normal ingredient), may occasionally contribute to increase the acidity. To determine the acidity of the collective 24 hours' urine, we take a solution of oxalic acid of known strength, and ascertain the relative quantities of a solution (of definite strength) of caustic soda which are required to perfectly neutralise equal volumes of the urine and of the oxalic acid solution. In this way it is found that the total quantity of free acid in the daily urine of a healthy man corresponds in neutralising power to about 36 grains of oxalic acid. The degree of acidity varies in different parts of the day. Dr Bence Jones first mooted the idea (in 1849), that the respective acidities of the secretions of the kidneys and stomach stood in an inverse relation to one another, and that the urine thus loses its acidity, and may even become alkaline during stomachal digestion. Dr Roberts of Manchester, who has subsequently investigated this point, finds that the effect of a meal on the acidity of the urine begins to shew itself in the second hour afterwards, is most marked during the next three hours, and disappears by the end of the sixth hour, the fluid being almost always positively alkaline during the third and fourth hours. Independently of this periodic alkalinity, the urine may be made alkaline at will by the administration of caustic alkalies, their carbonates or their salts, with organic acids (citrates, tartrates, &c., such as occur in many fruits); whilst after the administration of acids the acidity is much increased.

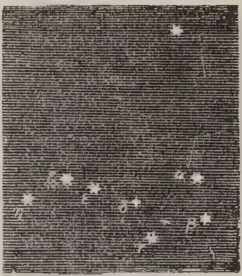
In disease, the urine may either contain only its ordinary ingredients in abnormal proportions, or it may contain ingredients not occurring in the healthy fluid. Thus there may be an excess or diminution of urea, an excess of uric acid, a diminution of chloride of sodium, which, in cases of inflammation of the lungs, may fall from 266 grains to a mere trace, and, by its daily diminution or augmentation, tells with certainty whether the disease is gaining or losing ground; an excess of colouring matter or of mucus, &c.; or, on the other hand, the urine may contain albumen, sugar, oxalic acid (in combination with lime), fat, leucine and tyrosine, bile-pigment, biliary acids, &c. The subject of 'the urine in disease' is, however, so wide a one that we must refer our readers for details to Lehmann's *Physiological Chemistry*, 3 vols. (translated for the Cavendish Society), to Dr Parkes's excellent work on *The Urine*, and to the various works of Dr Beale.

We conclude with a few remarks on the urine of mammals generally. The urine of the Carnivora is clear, of a light-yellow colour, a disagreeable odour, a nauseous taste, and an acid reaction. It contains much urea, little pigment, and little or no uric acid. The urine of the Herbivora is turbid, yellow, of a less unpleasant odour, and alkaline. In addition to urea, it contains hippuric (but no uric) acid, alkaline lactates, carbonates of potash and of the earths, oxalate of lime, and a small quantity of phosphates. By reversing the natural food of these classes, we reverse the characters of the urine.

The urine in many forms of disease becomes turbid on cooling, and soon deposits a sediment; and even healthy urine, after a few days' exposure to the air, loses its clearness, and throws down a deposit of mucus and various kinds of crystals. The investigations of the nature of the deposits thrown down by comparatively fresh urine in disease, is a subject of the highest importance in medicine, and is noticed in the article URINARY SEDIMENTS.

* He failed to detect it in only one case out of forty. He only succeeded in obtaining *one grain* by working for several weeks on the urine of two persons. The urine of the horse and cow yielded comparatively large quantities.

U'RSA MA'JOR, 'the Greater Bear,' and **URSA MINOR**, 'the Lesser Bear,' are two celebrated constellations in the northern hemisphere of the heavens. *Ursa Major* was distinguished as early as the time of Homer by the names *Arktos*, 'the Bear,' and *Hamaxa*, 'the Wagon,' the vivid imagination of the Greeks discovering a fanciful resemblance between these objects and the group of brilliant stars in this constellation. The Roman name Ursa was a translation of the Greek *Arktos;* the Romans also called its seven bright stars the *Septemtriones*, 'the seven ploughing oxen,' whence the adjective *septentrionalis* came to signify north. The common names throughout Europe for these seven stars are 'the Plough,' 'Charles's Wain,' 'the Wagon'—evidently derived from the classical epithets above mentioned. When the constellation of Ursa Minor was generally recognised, the adjective *megale*, 'great,' was annexed by the Greeks, and *major*, 'greater,' by the Romans, to the name of this constellation. The remarkable group of stars in the hinder part of the Great Bear being within 40° of the north pole, never sinks below the horizon of any place in a higher north latitude than 40°, a peculiarity alluded to by Ovid in his *Metamorphoses*. It contains a considerable number of stars, 17 of which are easily visible by the naked eye; but of these, only one (α) is of the first magnitude, two (β and γ) of the second, and eight (among whom are δ, ϵ, ζ, and η) of the third. The accompanying figure shews the arrangement of the seven stars constituting 'the Plough.' α and β are known as 'the Pointers,' from their use in detecting the *Pole-star* (q. v.). A line drawn from the Pole-star through η of the Great Bear, and produced its own length, passes close to the star Arcturus of the first magnitude.—*Ursa Minor* is less prominent in the heavens. It was also *Arktos* and *Hamaxa* among the Greeks, and *Arctus* and *Ursa* among the Romans, from the close resemblance of its chief star group to that of Ursa Major; but was, besides, distinctively denominated *Kynosoura* or *Kynosouris*, and *Cynosura*, 'the Dog's Tail,' from the circular sweep, resembling the curl of a dog's tail, formed by three of the stars in it. The star α in the extremity of the tail of the Little Bear, at present the Pole-star (q. v.), is the brightest in the constellation, though only of the third magnitude.



Constellation of the Plough.

According to the later mythical stories of the Greeks, Ursa Major was the metamorphosis of Callisto, one of Diana's nymphs, who, having violated

her vow, and being transformed by her indignant mistress into a bear, was slain by her son Arcas, and afterwards transferred to the heavens as a constellation by Jupiter; Arcas being at the same time metamorphosed into Boötes, the Arktophylax, 'Bear-warden,' of the Greeks. According to the other but less common legend, which represents the seven stars of Ursa Major as the oxen of Icarius, Arktophylax became *Boötes*, 'the Ox-driver.'

U'RSIDÆ. See BEAR.

U'RSON (*Erythizon dorsatum*), a quadruped early allied to the Porcupine, and often called the Canada Porcupine. The genus *Erythizon* differs from *Hystrix* (Porcupine) in the flatter head, the

Urson (*Erythizon dorsatum*).

shorter and not convex muzzle, the longer tail, and in having the quills short and half hidden in the hair. The U. is about the size of a small hare. It is found as far south as Virginia and Kentucky, and as far north as lat. 67°. Its quills are dyed by the Indian women, and worked into ornamental articles of various kinds.

URSULA, ST, a celebrated saint and martyr of the Roman calendar, especially honoured in Germany, and particularly at Cologne, which is the reputed place of her martyrdom. The legend substantially, in its present form, can be traced as far back as the end of the 11th or beginning of the 12th c., as it is found in the revised edition of the Chronicle of Sigebert of Gemblours (Pertz, *Rerum Germanicarum Scriptores*, viii. 310), which was made between 1106 and 1111. According to this writer, U. was the daughter of the British king Deonatus; and on account of her distinguished beauty, was sought in marriage by the son of a heathen prince who was originally named Holofernes, but afterwards, when a Christian, was called Ætherius. Her father was forced to yield to the demand; but U. made it a condition that her suitor should become a Christian, and that she should be allowed a space of three years, during which she proposed, in company with her maidens, to each of whom should be assigned a thousand companions, and a three-oared galley to convey them, to make a voyage of pious pilgrimage. The conditions were accepted; the maidens, to the number of 11,000, were collected from all parts of the world; and at length the expedition set sail from the British coast. Arriving at the mouth of the Rhine, they sailed up the river to Cologne, and thence upwards to Basel, where, leaving their galleys, they proceeded by land to visit the tombs of the apostles at Rome. This pilgrimage accomplished, they descended the river to Cologne, which, however, had meanwhile fallen into the hands of an army of Hunnish invaders, under the headship of a chief, who, although not named, is plainly the Attila of history. Landing at Cologne in ignorant security, the pious virgins fell into the hands of these barbarous heathens, by whom they were all put to the sword, with the exception of U., who, for her beauty's sake, was reserved as a prize for the chief. She too, however, as well as another maiden, who had at first concealed herself in terror, demanded to join her companions in martyrdom; and thus the full number of 11,000 victims was made up. Heaven, however, interposed. A host of angel warriors smote the cruel Huns; Cologne was again set free; and in gratitude to their martyred intercessors, the citizens erected a church on the site still occupied by the church now known under the name of St Ursula. Such is the legend as told by Sigebert, although it has undergone some modifications in late hands. The improbabilities and anachronisms of this legend were early observed; and it became the subject of an animated controversy soon after the Reformation. On the one hand, the centuriators of Magdeburg exposed its weak points with unsparing severity; on the other, a Jesuit father, Crombach, devoted an entire folio volume to the vindication of the substantial truthfulness of the narrative. Many suggestions have been offered as explanations of its most startling improbability—viz., the alleged number of the martyred victims, 11,000. One of these is, that this belief arose from the name of a virgin who was really the companion of U.'s martyrdom—*Undecimilla.* The record of the martyrdom in the calendar thus being 'Ursula et *Undecimilla V V.*,' 'Ursula and Undecimilla Virgins,' was easily mistaken for 'Ursula et *Undecim millia V V.*,' 'Ursula and *eleven thousand virgins.*'

Secular inquirers into the origin of the U. legend deny that it has the slightest foundation in any historical facts. They find the first traces of the reverencing of these virgins in martyrologies and missals of the latter half of the 9th c., in which mention is made either of a very small number of virgins whose names are given, or a larger indefinite number without names. In one metrical martyrology of this period, by Wandalbert, a monk of Prüm, they are already spoken of as thousands; and after the end of the 9th c. the number of 11,000 is found in the calendars. The name of U., however, does not occur till after the 10th c.; and it was not till the 12th c., that the reverence for U. became predominant over that of the associate virgins. With the 12th c. begins the discovery of the sacred bones. The *ager Ursulinus* was revealed by a vision in 1106; and at first, single skeletons were raised with the greatest solemnity; but beginning with 1155, the digging up of the field was carried on systematically for nine years, in the course of which thousands of skeletons were found, male as well as female, besides coffins, stone tablets with inscriptions, and the like. What the several relics were was revealed to a nun named Elisabeth, then living in the diocese of Trier, to whom the holy martyrs appeared in visions. In this way were identified a pope of the name of Cyriacus, an archbishop, several cardinals, bishops, and priests, and also Ætherius, U.'s bridegroom, along with whose title the cross, a crown, and other royal insignia were represented. It was also explained how all these men came to be in the company of the pious virgins. Even the children's bones found among the others were accounted for by revelations made forty years later to an abbot at Arnsberg, which confirmed and supplemented those of Elisabeth. The numerous human remains found in the Ursulan field at the north side of the city have been accounted for by antiquaries, by making it out to have been the burying-ground of the ancient Roman *Colonia Agrippina.* The origin of the legend is accounted for by Schade in his work *Die Saga von der Heiligen Ursula* (Han. 1854), on

the theory that it is a Christianised relic of old German paganism, in which U. has taken the place of the ancient goddess worshipped by the Scandinavians as Freyja (q. v.), and still remembered by the German people under the names of Berchta (q. v.), Hulda (q. v.), &c., and in Sweden by the very title of 'Old Urschel.'

But without pursuing further this curious inquiry, it will be enough to say, as concerns the Roman Catholic view of the matter, that while the most learned of the Catholic hagiographers, putting aside the idea of a directly and intentionally invented narrative, have traced the origin of the legend to a real historical massacre of a very large number of Christian maidens, which took place during the invasion of Attila, and soon after the celebrated battle of Chalons in 451, all the modern writers of that church are agreed in regarding the details of the narrative, the number, the pilgrimage to Rome, the interposition of the heavenly host, &c., as legendary embellishments of the medieval chroniclers.—See, for the full exposition and vindication of the history, Crombach, *Ursula Vindicata* (fol. Coloniæ, 1647); and for a more critical exposition of the historical foundations on which it rests, Binterim's *Calendarium Eccles. Germ. Colon.* (Cologne, 1824), and the *Zeitschrift für Phil. und Kathol. Theologie* (1850), *Heft* 2.

URSULINES, a religious order of females in the Roman Catholic Church, taking their name from the saint and martyr who forms the subject of the above article. They take their origin from Angela Merici, a saint of the modern church, born, according to the more received account, at Desenzano, in the latter part of the 15th century. She formed at Brescia an association of young females who bound themselves by a vow to labour for the tending of the sick, the instruction of children, the relief of poverty, and other such works of charity. After a time, a rule, in twenty-five chapters, was projected by Angela, and finally approved by the Bishop of Brescia, Cardinal Francis Cornaro. Angela was herself chosen as the first superior, in the year 1537, the community even at that time numbering as many as 76 sisters. During the lifetime of Angela, and for more than twenty years after her death, which occurred in 1540, the congregation was confined to the diocese of Brescia; but in the year 1565, a house was opened at Cremona; and with the approval of Popes Gregory XIII. and Clement VIII., it was spread over many dioceses of Italy. It was warmly encouraged by St Charles Borromeo, and at his death there were no fewer than 28 convents of the order in his diocese, comprising above 600 nuns. Soon afterwards, it was established in France, where one of its most distinguished members was the celebrated sister, Madeleine de St Beuve. It was in France that the sisters, although from the beginning they had been engaged in teaching, first formally added to their religious vows that fourth vow to devote themselves to the instruction of female children, which has since formed the great characteristic of the order. They were introduced into Savoy by St Francis de Sales in 1635; and in 1639, a convent was opened in Quebec, in Canada. About the same time, they were introduced into Germany—at Vienna in 1660, and at Freiburg, Kitzingen, and Prague soon afterwards—where they have continued to teach with great success; and their convents in various parts of Germany, but especially in Austria, at present number 36. The Ursuline sisters have several educational establishments in Ireland, in England, and in the United States, and may fairly claim the merit of having been mainly instrumental in maintaining among Catholics the education of female youth of the higher order through the 17th and 18th centuries. They have found many competitors among the younger sisterhoods of modern times.—See *Journal des Illustres Religieuses de l'Ordre de Ste Ursule*, 4 vols. 4to. (1690); *Chroniques de l'Ordre des Ursulines*, 2 vols. (Paris, 1676).

URTICA'CEÆ, or **URTI'CEÆ**, a natural order of exogenous plants, consisting of trees, shrubs, and herbs, natives of almost all parts of the world. According to many botanists, the order includes about 600 known species; whilst others, restricting it by separating from it several distinct orders, reduce it to about half that number, of which the common nettle may be regarded as the type. The leaves of all are alternate, furnished with stipules, and generally very rough, sometimes with stinging hairs. The inflorescence is various; the perianth usually divided, but sometimes a mere scale; the stamens inserted into the perianth, equal in number to its segments, when it is divided, and inserted at their base; the ovary free, one-celled, containing a single ovule. The fruit is a kind of nut, surrounded by the persistent and sometimes fleshy perianth, sometimes winged; and sometimes the fruits are variously aggregated. Under this description are comprehended *Cannabinaceæ* (q. v.), *Ulmaceæ* (q. v.), *Moraceæ* (q. v.), and *Artocarpaceæ* (q. v.), as well as the restricted U., which have filaments curved in bud, and turning backwards elastically when the anthers are bursting, the fruit an unopening nut. The juice of the restricted U. is watery, not milky; the wood in the arboreous or shrubby species, which are all tropical, is remarkably soft and light. The fibre of the bark of some is valuable. It is amongst the restricted U. that species covered with stinging hairs are found. See BŒHMERIA, NETTLE, NEILGHERRY NETTLE, and PELLITORY.

URTICA'RIA. See NETTLE-RASH.

URUGUAY', otherwise **BANDA ORIENTAL DEL URUGUAY**—i. e., 'the Eastern Bank of the Uruguay,' is a small South American state, bounded on the N. and N.-E. by Brazil, on the E. and S.-E. by the Atlantic, on the S. by the Rio de la Plata, and on the W. by the Uruguay. It is nearly square in shape, and its greatest length and its greatest breadth are over 300 miles. Area, 71,752 sq. m.; pop. (1870) 387,421. The interior of U. is very imperfectly known. In the south, all along the Rio de la Plata, and as far north as the Rio Negro, the country is a sort of terraced upland, with a bold, broken, treeless coast-line, possessing some excellent harbourage; while the shores facing the Atlantic are low and sandy. Further east, rises a woody plateau; but high, bare, grassy plains, traversed by ranges of low hills, seem to be the predominant feature. The climate is mild; rain falls pretty copiously in winter, but is rare in summer. The most important rivers are the Rio Negro, the Daiman, the Arapey, the Yaguaron, and the Sebollati. Agriculture is in a very backward state, although the soil is naturally rich. Small quantities of wheat, maize, barley, rice, peas, beans, flax, hemp, and cotton are raised, and fruit trees thrive well; but the wealth of the country consists in its splendid pasturage, which supports great herds of horned cattle, horses, and sheep. The wool of these Uruguayan sheep is of a superior quality. The wild animals embrace the tapir, deer, ounce, monkey, paca, rabbit, and fox; and large packs of wild dogs infest the plains. U. has almost no manufactures, and very little commerce, as yet. The chief exports are jerked and salted beef, tallow, hides, horn, and hair; and the chief imports woollen goods, household furniture of

all kinds, sugar, cordage, agricultural implements, timber, &c. In 1869, the annual value of the exports amounted to 16,830,678 piastres or dollars; and that of the imports to 13,386,886 piastres or dollars. The capital of U. is Monte Video (q. v.), and the other towns of note are Maldonado and Colonia del Santo Sacramento.

U. was originally colonised by Spanish settlers from Buenos Ayres, on the other side of the La Plata; but the territory which forms the natural limit of Brazil on the south was claimed by Portugal, and a war ensued between the two nations for its possession, which terminated in favour of Spain. U. was now attached to the vice-royalty of Buenos Ayres, and received the name of *Banda Oriental*—i. e., as has been explained above, the country on the eastern bank of the Uruguay. Its independence was secured by treaty in 1828, when it took the title of *Republica del Uruguay Oriental;* but like most of the South American republics, it has suffered almost incessantly from internal discords.

URUMEYAH, URUMIJAH, URMEA, Lake, called also the *Lake of Maragha* (q. v.), *Lake of Tabriz*, and by the neighbouring peoples, *Kapauta* (Armen. *kapoit*, blue), the principal lake of Persia, is situated in the west of Azerbijan, about 34 miles west from Tabriz. The lake, which is 4320 feet above sea-level, is about 80 miles in length from north to south, has an average width of 25 miles, and contains more than 1900 Eng. sq. miles. It is one of that class of lakes which receive, but do not emit streams; and despite the fact that its feeders include such rivers as the Aji-su, 180 miles long; the Jage-tu, 140 miles long; and the Ta-tu, 90 miles long, it has only an average depth of 12 feet. The water is largely impregnated with saline substances (according to one authority, the salts constitute 25 per cent. of the whole weight), and is so heavy as to be little ruffled by the strongest wind. No fish or mollusca are found in it. Six large isles, and a multitude of islets and rocks, shew themselves just above its surface, being mostly grouped together near its centre. The lake is fast drying up, leaving a gradually widening beach of thick saline incrustation, which supplies with salt the whole of Kurdistan. The lake was known in ancient times as *Matiana*, or *Mantiana*.

URUMEYAH, a town of Persia, situated 10 miles west of the lake, in a wide and fertile plain, is surrounded with a mud wall and moat, but has no gates. Extensive fruit and vegetable gardens are situated both within and without the walls. The houses of the better classes are lofty, spacious, and sumptuously furnished; and many of those of the poorer classes are tastefully adorned with flowers and vines. U. is the residence of a Persian governor, of a Nestorian bishop, and of an American mission; it has a pop. of about 22,000, a large number of whom are Nestorian Christians and Jews. U. was anciently known as *Thabarma*, or *Thebarmæ*, and was held in great veneration by the Persians, by reason of the legend which fixed it as the birthplace of Zoroaster (q. v.). In 624 A. D., the town, including a magnificent fire-temple, was destroyed by the Emperor Heraclius.

U'RUS, a great animal of the ox-kind, which anciently inhabited the forests of Central Europe, and is described by Cæsar (*Bell. Gall.* vi. 28) as common in the great Hercynian Forest; as scarcely less than an elephant in size—an evident exaggeration—but otherwise resembling an ox, of great strength, of great swiftness, and of great fierceness. He mentions that the horns were very different from those of the oxen of Italy—large, spreading, and sharp. This character is found in the wild cattle of Chillingham and other parks in Britain, and in some of the Highland breeds of oxen; and the probability seems to be that the U. was the wild original of the domestic ox, and not a bison, nor any now extinct species, although some authors, apt to constitute species upon very slight grounds, maintain a contrary opinion.

URVAS'Î. See PURÛRAVAS.

USBEGS, or USBEKS, a people of Turkish race, who, at the close of the 15th c. of the Christian era, invaded and conquered the numerous principalities into which Turkestan was at that time divided, and have ever since maintained dominion over the country. At the present day, they are for the most part a settled people, occupying themselves in the cultivation of the soil and in trading, and are scattered over both Independent and Chinese Turkestan. The most probable supposition regarding their origin is that they immigrated from Kiptchak (q. v.), and assumed the name of U. from Usbeg, one of their chiefs. The U. of Khiva, Bokhara, Khokan, and of Chinese Turkestan, differ from each other in language, manners, and customs. Those of Khiva speak a dialect of the Turkish, are honest and generous, and destitute of the treachery and duplicity which are so characteristic of oriental civilisation, are passionately fond of music and poetry, and, though zealous Mohammedans, still retain many of their ancient heathen usages. They pride themselves much on the purity of their Usbeg descent, but most of them shew evident traces of an admixture of Iranian blood. The U. of Bokhara have become largely mingled with the Tajiks, and have consequently lost many of their national characteristics. Those of Khokan are very different from the two previous, and are as much Kirghis, Kiptchaks, and Kalmucks as they are U.; the fact that the U. have been the dominant race in Turkestan for three centuries and a half, having given the name such a prestige of nobility and good-breeding, that it is generally assumed by such members of other races as settle in cities.

USE AND OCCUPATION is the technical name given in the law of England to the beneficial enjoyment of premises by a tenant, who occupies the real property of another, such as houses and farms. In all cases where a person has had use and occupation of another's premises, with the assent of the owner, an action lies for the value thereof, which value corresponds to rent under an ordinary lease. Hence, where it is doubtful whether there has been a valid lease executed between the parties, the landlord can nevertheless recover rent under the head of use and occupation.

U'SEDOM, an island belonging to Prussia, lies at the mouth of the Oder, and together with the island of Wollin, shuts off the Stettiner Haff from the Baltic. It is of very irregular shape, being much indented by branches of the Haff, is 34 miles in extreme length, and 15 miles broad. Area about 148 sq. m. On its north-east side is the port of Swinemünde (q. v.); on the south side is the small town of Usedom, with 1500 inhabitants.

USES, in the law of England, is the old name for trusts, which has superseded the other in most respects. Uses and trusts correspond to the *fidei commissum* of the Roman law. A use was a confidence reposed in another who was tenant of the land, or *terre-tenant*, that he should dispose of the land according to the intention of the *cestui que use*, or him to whose use it was granted, and suffer him to take the profits. See TRUST.

U'SHANT (Fr. *Ouessant*), an island in the Atlantic Ocean, belongs to France, and is included in the dep. of Finisterre, from the west coast of which it is distant about 17 miles. It is the largest of a small group of islets called the *Iles d'Ouessant*, has an area of 7 sq. m., and contains about 2271 souls. The coasts are escarped and difficult of access; the soil is fertile. The inhabitants are employed in fishing, and in rearing cattle and horses.

USHAS (from the Sanscrit *ush*, 'to shine, to burn,' and kindred with the Greek *ēōs* or *heōs*, and the Latin *aurora*), 'the Dawn,' is one of the female deities of the Vedic religion of India (see INDIA, sec. *Religion*), and amongst these is invoked with special predilection by the poets of the R'igveda hymns. The invigorating influence which the dawn exercises on body and mind, and the luminous and other phenomena connected with the beginning of the day, form the subject of some of the best portions of Vedic poetry; and out of them Ushas arises as one of the most pleasing goddesses of the ancient Hindu pantheon. She is invoked as 'the affluent,' as 'the giver of food,' and 'the bringer of opulence;' she is asked to bestow on the pious 'riches with horses and cattle,' 'posterity and troops of slaves;' and she is praised for the many boons she has showered on the worshippers who were liberal to her. She is the goddess 'endowed with an excellent intellect,' and the 'truthful,' or fulfiller of her promises. 'She animates the diligent;' when she appears, 'bipeds and quadrupeds (are in motion),' 'the winged birds flock around from the boundaries of the sky,' and 'men who have to earn their bread quit their homes.' She rides in a 'golden chariot,' which is 'ample and beautiful;' and the Sanscrit word *go* meaning a cow (or, as a masculine, an ox), and also a ray of light, she is not only 'the mother of the rays of light,' or attended by them, and rays of light are her banner, but her chariot is drawn by 'ruddy *kine*,' or, as they are sometimes called, 'ruddy oxen.' Less frequently she is spoken of as travelling with horses; for the horse, as a symbol of light, is more especially appropriated to the god of the sun. The relation of Ushas to other Vedic deities is of a twofold, a physical and a ritual, character, inasmuch as the phenomena of dawn are connected with other phenomena of nature, and as certain religious ceremonies are performed at daybreak. On these grounds, she is frequently addressed as 'the daughter of heaven;' and when her 'parents' are spoken of, the commentator explains this word as implying 'heaven and earth.' She is further called the daughter of night (night being the precursor of the dawn); but, on other occasions, she is also spoken of as having night for her sister. She is, besides, the sister of the two luminous deities, *Bhaga* and *Varun'a*, and the faithful wife of *Sûrya*, the sun. According to an old commentator (*Yâska*), she would in one passage of the R'igveda also be the deity 'who has the sun for her child,' 'either because the sun is her companion, or because he absorbs the moisture (i. e., the frost);' but as *rus'advatsâ*, the word, so interpreted, admits also of another rendering, it is doubtful whether she bears this epithet, the more so as in another passage the sun is said to follow Ushas as a man follows a woman. The As'wins being the luminous twin-gods, who probably represent the transition from darkness to light, and therefore that intermingling of both which becomes inseparable (see John Muir's 'Contribution to a Knowledge of the Vedic Theogony and Mythology,' in the *Journal of the Royal Asiatic Society*, new series, vol. ii., 1866), Ushas is called their 'friend'—according to Sâyan'a, also their sister; she 'follows their lustre,' and 'awakes' them to partake of the Soma prepared for them; and in their turn they are asked 'to unite with the dawn. Another god, who originally on physical grounds is associated with Ushas, is *Indra* (q. v.), the ruler of the bright firmament. He 'generates (i. e., causes to appear) sun and dawn,' and 'appoints them to their office,' which is that of dispelling darkness; but though, 'when (in the morning), desiring (the Soma), he honours the dawn,' his ascendency during the day becomes fatal to her; for then 'he slays her,' 'breaks her chariot;' and 'her shattered chariot reposing on (the banks of) the river Vipâs', she departs from afar.' Most of these deities become, in consequence, associated with Ushas also as sharers in certain sacrifices which are offered to her; and besides these, Agni, the god of fire, who carries the offerings to the gods, and Soma (q. v.) Like many of the most poetical deities of the Vedic creed, also Ushas is excluded from the Hindu pantheon of the classical period. Her place is there taken by *Arun'a* (the ruddy), whom the epic poems and the Purân'as make the son of the patriarch Kas'yapa and his wife Vinatâ, and the younger brother of Garud'a, the bird-vehicle of Vishn'u. According to the *Mahâbhârata*, he was appointed by the gods to the office of charioteer of the sun, in order to intercept his fiery heat, when the sun, angry with the gods for being exposed to the enmity of Râhu (q. v.), it was feared, would consume the world. Where represented, *Arun'a* is therefore seated before the sun on his chariot, driving his horses; but as the legends deprive him of his legs, his body is seen perfect to his knees only.

USHER, JAMES, Archbishop of Armagh, and by common consent the most learned prelate that ever adorned the Irish Protestant Church, belonged to one of the oldest Anglo-Irish families, and was born in Dublin, January 4, 1580. His father, Arnold Usher, one of the clerks in Chancery, was a gentleman of good estate, and his uncle, Henry Usher, preceded him in the archbishopric of Armagh. At the age of 13, he entered Dublin College, where his predilection for history soon revealed itself. Having resolved to devote himself to the service of the church, he proceeded, after the solid fashion of the times, to read up the entire literature of ecclesiastical antiquity—a task which occupied him from his twentieth to his thirty-eighth year! In 1601, he was ordained deacon and priest, and was shortly after appointed preacher at Christ Church, Dublin. In 1607, he was chosen to the chair of Divinity, a post which he held for 13 years. In 1609, he made one of his numerous visits to England, in the course of which he made the acquaintance of the most distinguished scholars of the age. In 1613, his first publication appeared, entitled *De Ecclesiarum Christianarum Successione et Statu*, which was designed as a continuation of Bishop Jewel's *Apology*. The work was divided into three parts, of which only the first, reaching to the period of Hildebrand, and part of the second, were finished. In 1615, he was appointed, by a convocation of the clergy held at Dublin, to draw up a series of articles (the number amounted to 104) relating to the doctrine and discipline of the Irish Protestant Church, in which the doctrines of predestination and reprobation (of which U. was an unflinching apologist) found prominence. These and other views, such as, that bishops were not a different *order* from presbyters, that the Sabbath should be strictly enforced, that no toleration should be granted to Catholics, laid him open to the charge of Puritanism; but as his loyalty to the principle of monarchy was undoubted, he suffered no diminution of the royal favour; on the contrary, King James promoted him to the bishopric of Meath in 1620; and in 1623, constituted him a privy-councillor of

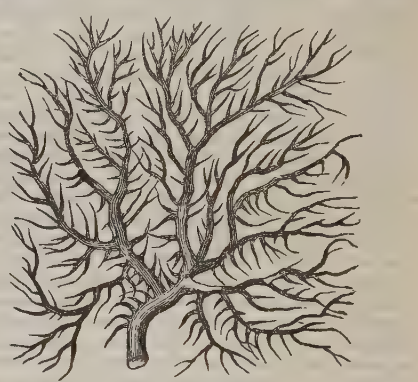
Ireland. Two years later, he was raised to the highest ecclesiastical dignity in the kingdom, the archbishopric of Armagh, and in his official capacity 'vigorously' opposed the toleration of popery and the spread of Arminianism. In 1632, U. published *Veterum Epistolarum Hibernicarum Sylloge*, a collection of letters out of several ancient MSS., concerning the state of the Irish Church from 592 to 1180; in 1638, *Emmanuel, or a Treatise on the Incarnation of the Son of God;* in 1639, *Britannicarum Ecclesiarum Antiquitates*, which is said to contain 'a most exact account of the British Church, from the first planting of Christianity, twenty years after our Saviour's crucifixion, down, both in Britain and Ireland, to the end of the seventh century;' in 1641, *The Judgment of Dr Reynolds concerning the Original of Episcopacy defended*, *The Original of Bishops*, *The Power of the Prince and the Obedience of the Subject*, &c. When the Civil War broke out, U., who was in England at the time, espoused the side of the king, refused to sit, when nominated, among the Assembly of Divines at Westminster, and made himself very obnoxious to the parliament by the sermons which he preached at Oxford. When the fortunes of the king began to decline, U. left Oxford; his property and revenues in Ireland were seized, and after a residence in Wales and elsewhere, he came to London in 1647, where, in spite of his royalist sympathies, he was chosen by the benchers preacher of Lincoln's Inn, a post which he retained till his death, March 21, 1656. Cromwell, who had a great respect for his learning, ordered his remains to be interred with great magnificence in Erasmus's Chapel in Westminster Abbey. U. was a man of undoubted ability and of enormous erudition, pious and free from worldly ambition; but he lacked force of character, real insight and intellectual power; hence, though pronounced by Dr Johnson 'the great luminary of the Irish Church,' he exercised less influence over the course of contemporary events than the humblest of Cromwell's Ironsides. Nor can it be shewn that posterity is very deeply indebted to him for more than the example of a virtuous and studious life. U.'s chief works, besides those already mentioned, are his edition (1644) of the *Epistolæ* of Polycarp and Ignatius; his treatise *De Romanæ Ecclesiæ Symbolo* (1647); *Dissertatio de Macedonum et Asianorum Anno Solari* (1648); and *Annals of the Old Testament* (1650—1654), a chronological work. After his death, there were published (from his numerous MSS.), *Chronologia Sacra*, &c. (Oxford, 1660), by which and his *Annals* he is most widely known; a volume of *Sermons; Historia Dogmatica Controversiæ inter Orthodoxos et Pontificios de Scripturis et Sacris Vernaculis* (Lond. 1690); *A Collection of three hundred Letters written to James Usher, Lord Archbishop of Armagh*, to which is prefixed a life of the archbishop by his chaplain, Richard Parr, D.D. (Lond. 1686). A collected edition of U.'s works, in 16 vols., with a new biography, was published at Dublin in 1841, by Dr Elrington.

USHER OF THE BLACK ROD, one of the officers of the order of the Garter (q. v.), coeval with the institution of the order, and originally called 'Hostiarius capellæ regis infra castrum de Windsor.' The rod from which his title is derived is of ebony, mounted with gold, 3½ feet in length, having at the top a lion sejant, holding before him in his fore-paws a gold shield charged with the royal cipher in gold surrounded with the Garter. He has a mantle like that of Garter King of Arms, and his badge is a gold knot surrounded with the Garter, and ensigned with the royal crown. It is the practice to unite this office with that of the king's first gentleman usher daily waiter at court, who is one of the chief officers of the House of Lords. In the capacity, it is one of the functions of the Gentleman Usher of the Black Rod, or of his deputy, who is known as the Yeoman Usher of the Black Rod, to desire the attendance of the Commons in the House of Lords when the royal assent is to be given to bills by the sovereign or Lords Commissioners; also to execute orders of commitment for breach of privilege and contempt, and to assist at the introduction of peers, and other ceremonies of the Upper House.

USHER OF THE GREEN ROD, one of the officers of the order of the Thistle (q. v.), whose duties consist in attendance on the sovereign and knights when assembled in chapter, and at other solemnities of the order. The rod from which the title is taken is of green enamel, three feet in length, ornamented with gold, having on the top a unicorn of silver, holding before him an escutcheon charged with the cross of St Andrew.

U'SKUP, or **SCO'PIA**, a town of European Turkey, in Rumili, on the Vardar, 120 miles north-west of Salonica. The town, which is built on hilly ground, contains 16 mosques, with black domes and minarets, interspersed among fruit trees. Here are the ruins of an ancient Roman aqueduct, consisting of 55 arches. Leather is manufactured. Pop. estimated at 10,000.

U'SNEA, a genus of lichens, having a much branched thallus, with an elastic thread in the centre. Some of the species are natives of Britain. They grow on trees, and are generally pendulous.



Usnea barbata.

They contain the vegetable principle called *Usnine*, which, however, is also found in many other lichens. They are sometimes used in dyeing, like archil and cudbear. From their appearance, many of the species of U. receive the popular name of BEARD-MOSS.

USTILA'GO. See SMUT.

U'SUFRUCT, in Scotch Law, is adopted from the Roman Law, to denominate one of the three personal servitudes, which were use, usufruct, and habitation. Usufruct is better known under the name of Life-rent (q. v.), or Estate for Life (q. v.).

U'SURY. See INTEREST.

U'TAH (named from an Indian tribe Utah, or Utes, dwellers in mountains), a territory of the U. S., lying between latitude 37°—42° North, and longitude 109°—114° West, containing 84,476 square miles, bounded north by Idaho and Wyoming, east by Colorado, south by Arizona, and west by Nevada. Its chief town and capital is Salt Lake City (q. v.). Utah is an immense basin, from four thousand to six thousand feet above the level of the sea, surrounded

by mountains, which at some points reach the altitude of 8000 to 13,000 feet. Excepting Green and Grand rivers, in the east and south-east, Santa Clara river in the south-west, and the head branches of the Colorado, which flows through a cañon 1200 feet in depth, its rivers empty into the Great Salt Lake, in the northern centre of the territory, and similar salt lakes or inland seas. This great basin, which includes the new state of Nevada, is formed by the Wahsatch Mountains on the east, and the Sierra Nevada on the west. The formations are primitive and metamorphic, with secondary basins 15 or 20 miles wide. The principal mountains lying within the territory are the Humboldt range, 6600 feet high in the west, and the Wahsatch in the south, 12,000 feet. There are numerous lakes, usually without outlet, except into each other, many thermal springs and salt springs. The rocks are mostly primitive, and rich in granite, jasper, syenite, porphyry, and quartzes, shewing everywhere evidences of volcanic action. There are also ridges of carboniferous limestone containing calcareous spar; and near Salt Lake City occur boulders of serpentine, fine gray granite, sandstones, conglomerates, talcose and striated slates, gypsum, limestone, and marble of every hue in large masses. Iron is abundant; and there have been found gold, silver, copper, zinc, lead, inexhaustible quantities of bituminous coal, sulphur, alum, borax, and petroleum. Among the animals are the antelope, elk, deer, Rocky Mountain sheep, cougar, catamount, wolves, foxes, beavers, porcupines; quail, grouse, swans, wild geese, pelicans, ducks; perch, pike, basse, and salmon-trout of 30 lbs. weight. Generally, vegetation is not luxuriant, and timber, except pines and firs in the mountains, scarce. The country has good grass for grazing, and some wild fruits. The climate is bleak and changeable, with deep snows and intense cold in winter, and heats in summer, accompanied with storms of thunder and dust. The soil, as a whole, may be described as barren, with spots of remarkable fertility, producing 60 to 100 bushels of grain to the acre. Much of the soil is strongly alkaline. The chief crops are wheat, oats, barley, maize, buckwheat, flax, hemp, fruits. Cattle and sheep are abundant. The chief manufactures are those required in a new country, as farming-implements, furniture, carriages, woollen goods, leather, steam-engines, and machinery and cutlery, in which are employed a large number of skilled English artisans.

The pop. of U. consists almost entirely of Mormons, or members of the Church of the Latter-day Saints, governed by a hierarchy. In 1860 they numbered 40,295 according to the census, and in 1870 they had increased to 86,786. The total population of the territory in 1880 was 143,963. Probably three-three-fourths of them are emigrants from Great Britain, and a large number are from Sweden and the north of Europe. See MORMONS.

Provision has been made for education, in the foundation of a university, a free academy, and common schools. There are two weekly newspapers. There is a United States territorial government, with governor, secretary, marshal, and judges appointed by the president, and a legislative assembly elected by the people. In 1871 action was taken in the United States courts against polygamy as a criminal practice. The Central Pacific Railroad passes through Northern Utah, with a branch to Salt Lake City.

The Shoshones, Utes, and other Indians, numbering about 12,800, are in the Utah superintendency.

U'TERUS. See WOMB.

U'TICA, a city of New York, U. S., on the Mohawk River, at the junction of the New York Central and Utica and Black River Railways, and the Erie and Chenango Canals, 95 miles west-north-west of Albany. The city, regularly and handsomely built, rises from the south bank of the river to an elevation of 150 feet. Among its buildings are a city hall, public halls, 26 churches, 6 large hotels, 4 banks, a cotton-mill, 2 woollen-mills, a state lunatic asylum with 500 patients, Catholic and Protestant orphan asylums, academies, and schools. There are also manufactories of flour, starch, organs, pianofortes, clothing, carriages, machinery, carpets, oil-cloth, &c.; and 11 newspapers and periodicals, of which 2 are Welsh and 1 German. At the period of the revolution, U. was a frontier trading-post, and the site of Fort Schuyler, built to guard the settlements against th French and Indians. In 1813, it had a pop. of 1700 in 1860, 22,528; in 1870, 28,804; in 1880, 33,914.

UTILITA'RIANISM, the name of the peculiar theory of Ethics, or of the ground of moral obligation, that adopts, as the criterion of right, the happiness of mankind. The word 'Utility' was employed, in this acceptation, by Jeremy Bentham; the form 'Utilitarianism' was first used by John Stuart Mill.

The doctrine of Utility is opposed to all those theories that refer us to some internal sense, feeling, or sentiment, for the test of right and wrong; a test usually described by such phrases as a Moral Sense, and Innate Moral Distinctions. See ETHICS. Whence Utility is sometimes termed the *external* or objective standard of morality. It is also opposed to the view that founds moral distinctions on the mere arbitrary will of God.

The Utilitarian theory has been maintained both in ancient and in modern times, although with considerable variation, not merely in the mode of stating it, but in important peculiarities. Thus, in ancient times, it was held by Epicurus, but in a purely self-regarding form; each person's end was his own happiness exclusively, the happiness of others being instrumental and subordinate. The modern phase of the theory may be said to begin with Hume. He employed, as the leading term of his system, not Utility, but Benevolence; whereby he gave especial prominence to the disinterested side of moral actions. He strenuously maintained, what must be regarded as the essential feature of the Utilitarian doctrine, that no conduct is to be deemed worthy of moral approbation, unless, in some way or other, it promotes human happiness; and that actions ought to be visited with disapprobation, exactly according as they have the opposite tendency.

Jeremy Bentham is, more than any other person, identified with the theory of Utility, which was in his hands, not merely the foundation of Ethics, but also the basis and justification of political and legal reforms. Having in view the state necessity of sacrificing smaller interests to greater, or, at all events, of not sacrificing greater interests to smaller, he described the ethical end as 'the greatest happiness of the greatest number.' He illustrated the doctrine by setting it in opposition to *asceticism*, which he interpreted to mean, that pleasure is forfeited, and pain incurred, without yielding a compensating amount of good, either to the agent or to other persons.

Paley advocated a form of Utility. He made the will of the Deity, enforced by future rewards and punishments, the impelling motive to duty; but in determining what that will was, in particular cases, he included a reference to the beneficial tendency of actions.

James Mill maintained substantially the views of Bentham. Sir James Mackintosh, while differing in some points from Bentham and from Mill, in the main adhered to Utility as the ultimate standard of

right. John Austin, in his *Province of Jurisprudence Determined*, has contributed a lucid exposition and a powerful defence of the principle. John Stuart Mill has devoted a separate work to the subject. Samuel Bailey, in his *Letters on the Human Mind*, vol. iii., has discussed the ethical problem fully, and pronounced upon the utilitarian side. Herbert Spencer ranks among the upholders of the theory; and likewise Bain, in his edition of Paley (Chambers's series), and in *The Emotions and the Will*.

Before stating the arguments for and against the principle of Utility as the basis of morals, it is proper to inquire what sort of proof an ethical system is susceptible of. Ethics is a practical science (see SCIENCES), and, as such, involves an end; having the peculiarity of being the final or comprehensive end of all human conduct. See TELEOLOGY. Now, in the speculative or theoretical sciences, *ultimate* principles cannot be proved; it is the nature of proof to rest one doctrine on some other doctrine, so that we must come at last to what is taken without proof; we cannot prove our present sensations; nor can we demonstrate that what has been will be; we must take these things for granted. And so it is with ultimate ends in the practical sciences: we cannot prove that each person should seek his own happiness; we must assume it as an ultimate fact, and trace the consequences. The final end of all conduct cannot be reasoned; it must be gathered from the actual conduct of men; we must find by observation what ends men actually pursue, and, if we can, generalise them into one comprehensive statement. The function of argument in the case is to shew where inconsistency has crept in, or to make professions accord with practice. Thus it is, that the supporters of Utility aver that men, even although refusing the theory, still proceed upon it in their conduct; and that the doctrine cannot be impugned consistently with the admitted motives of human action. Human beings, as a rule, have no other end in life but happiness, either for themselves or for others; and morality belies human nature if it does not accord with this universal object of pursuit.

Although Utilitarians hold that good and evil, right and wrong, are properly determined by a calculation of the consequences as regards human happiness, they do not all maintain that past or existing systems of morals have been on all points framed on this principle. Bentham and James Mill appear to have thought that the rule has always been kept in view, though often badly applied. But others, equally earnest in regarding it as the only legitimate rule, are of opinion that, in the past and existing ethical precepts, men have been guided partly by Utility, and partly by Sentiment—that is, liking or disliking for the act itself, irrespective of any further consequences. Thus, the veneration of the Hindu for the cow, on which ethical duties are founded, is an instance of sentimental liking; the Jewish and Mohammedan prohibition of the pig is a matter of sentimental dislike. In the ceremonial rites of ablution, so widely prevalent, there is a certain shew of Utility, mixed up with the fancy of cleanliness or purity. In the doctrine of the sacredness of kings, there is a combination of Utility and Sentiment.

The following are the chief objections to the utilitarian scheme, with the arguments in reply.

I. It is maintained that Happiness is not, either in fact or in right, the sole aim of human pursuit; that men actually, deliberately, and by conscientious preference, seek other ends. For example, virtue is an end in itself, to be sought whether it yield happiness or not, and even if it should be productive of the greatest misery. The qualification, however, is always added, that virtue, in the long run, without intending it, and all the more for not intending it, is the unfailing source of happiness.

To which the supporter of Utility answers:

1. It is quite true that men seek other ends than immediate happiness to themselves and to others, and that, in particular, they cultivate the virtues as ends in themselves, without always thinking of them as means to happiness. But, then, this is by the operation of a familiar law of the mind, whereby what was originally of the nature of means, comes at length to be valued as an end; such is the well-known case of the love of money. The virtues of justice and veracity are essential to human society, just as money represents the basis of subsistence; and by frequent association, the regard that we pay to the end is transferred at last to the means.

2. It may be shewn in many ways that the great social virtues derive their worth in our estimation from their subservience to human happiness, and not by any absolute title of their own. Take, first, Veracity or Truth, which, of all the moral duties, has most the appearance of being an absolute and independent requirement. A little consideration will shew that even this is not in our eyes an unlimited or unqualified virtue. Men have always approved of deception practised towards an enemy in war, to a madman, or a highway robber; also, secrecy or concealment, even although misinterpreted by others, is generally allowed—unless it leads to some pernicious results; while, if the divulgence of the truth were attended with harm, it would be universally reprobated. But an absolute standard of truth is incompatible even with secrecy or disguise; in departing from the course of perfect openness, or absolute publicity of thought and action, in every possible circumstance, we renounce ideal truth in favour of a compromised, qualified veracity—a following of truth only so far as is expedient.

Again, as regards Justice, the presence of considerations of Utility is equally obvious. There is no absolute rule of justice that does not bend to circumstances. If justice be defined, giving every one his own, or what he is entitled to, there is the show of an absolute rule; but, in reality, nothing is determined. The meaning is, to give to each what *law* and *custom* have declared to be a man's own. It is declared just for an elder son to receive a larger share of the parental estate than all the rest of the children put together; but it is clear that whatever justice there is in this, must be founded on some ground of expediency. (See on this subject, J. S. Mill's *Utilitarianism*, chap. v.)

II. It is further objected to the adoption of Utility as the standard of Right, that the full consequences of actions are too numerous, involved, and complicated to be reduced to calculation; and that even where the calculation is possible, people have seldom time to make it.

To this, it is answered, first, that the primary moral duties refer to conduct that can be fully calculated to the satisfaction of any reasoning mind. Thus, to revert to the two leading examples, Truth and Justice: the habitual disregard of these duties would soon bring a society to utter confusion and ruin; without them, there could be no social co-operation; man would fall below the condition of the gregarious animals; the race could hardly be saved from extirpation. On the other hand, the observance of these duties, in a high degree, raises to a corresponding degree the means of human happiness. The balance of advantages is all on one side—there is no case for the other side at all.

There have always been moral rules or enactments where the calculation of consequences was much less easy; for example, the indissolubility of

marriage is maintained in some countries, and not in others; and there have been considerable differences as to the forbidden degrees of affinity in marriage. In these usages, there are both advantages and disadvantages, and the preponderance is variously estimated by different calculators. In such cases, the utilitarian would say: Do not make a compulsory enactment restricting liberty, which restriction is an evil in itself, unless the balance of advantages is unquestionable and great.

As to the argument, that it is impossible to make the calculation of consequences every time we perform a moral act, the reply is, this is unnecessary; the calculations as to the various duties have been already made, and are embodied in rules, which rules we remember and apply without thinking of the process gone through in arriving at them. The navigator at sea does not need to compute the *Nautical Almanac* every time he determines his longitude; he carries it to sea with him ready for use.

III. A third objection is, that men in all ages have distinguished between the Right and the Expedient, that is, the Useful; the two are in most languages put in opposition or contrast. The reply is, that the Expedient, when thus opposed to the Right, commonly means what is expedient for the agent at the time, but is not expedient for people generally, or even for himself in the long-run. It is sometimes expedient, in this sense, to tell a lie, to rob, or to murder; but such actions are not expedient in the sense of general utility, or the greatest happiness of mankind.

It is further to be remarked in this contrast of the Expedient and the Right, that the Expedient may mean simply an addition to our conveniences or comforts, something that it is well for us to have, but that we might do without. Thus, it is highly expedient to possess cheap postage, railways, and electric telegraphs. On the other hand, the Right points to the essentials of our existence; without the fulfilment of contracts, respect to life and property, obedience to law, society would be dissolved. The distinction was expressed in one of Cromwell's speeches, by the contrast of a nation's Being and its Well-being; what secures the one is emphatically the Right, the promotion of the other is the Expedient. Right is the highest and most imperative form of Expediency.

IV. A fourth objection against the utilitarian scheme is, that all useful things are not made obligatory; it may be useful to have railways, but it is not a duty of every man to make them. But the utilitarian, while contending that nothing should be made a moral duty but what contributes to the happiness of mankind, does not hold the converse, that whatever promotes human welfare is a moral duty.

So much for the objections. The positive ground of Utilitarianism is, that men actually recognise happiness as their paramount consideration, or highest end. This, as a general rule, is too obvious to require proof. Each one's plan of life is principally made up of ideas of happiness to self or to others. All our good wishes to one another are repetitions of the one idea, 'May you be happy.' The seeming exceptions have been noticed above.

One of the strongest confirmations of the doctrine is derived from the usual inducements to right conduct, common to all moralists. We find that no one can preach morality without making use of its bearings upon happiness. The very meaning of the terms expressive of the highest virtues—love, goodness, mercy, compassion, fidelity, honesty, integrity, justice—is something that relieves the pains and augments the pleasures of sentient beings. To love is to make the object happier, and love is the fulfilling of the law.

Although there be duties occasionally imposed upon men that have no obvious tendency to increase happiness, but rather to diminish it, as the labours of some cumbrous ceremonial system like Hinduism, those duties have to be upheld by the fear of punishment or the hope of reward, still testifying to the predominating motives of the human mind. It is not, however, by reference to traditional observances that the happiness motive is most clearly tested. The proper plan, as remarked by Mr Samuel Bailey, is to try it upon some fresh case, some entirely new enactment, when it will be found that the interest or happiness of the community is the *sole* consideration appealed to. If a new law of inheritance is proposed, or a new government Board constituted, nobody advances any other criterion but expediency, or the good of certain persons now or in the future; unless such expediency can be shewn, no one will move in the matter at all; and the earnestness of the promoters will be in exact proportion to their sense of the resulting good. We may, through blind conservation, keep up usages not only destitute of utility, but productive of harm; but we should not now deliberately set up for the first time any practice that we did not regard as conducive to somebody's well-being. Traditional associations excepted, the strength of our approbation or disapprobation always follows our estimate of happiness or misery produced.

It is worthy of remark that Utility, or the promotion of human welfare, as it is the very meaning of the work of a public benefactor, expresses the sum of the labours of all the best men that have ever lived.

UTO'PIA (Gr. *ou*, not; and *topos*, a place, equivalent, therefore, to 'Nowhere') is the name given by Sir Thomas More (q. v.) to the imaginary island which he makes the scene of his famous political romance, *De Optimo Reipublicæ Statu, deque Nova Insula Utopia*, originally published in Latin, at Louvain, in 1516, and translated into English by Bishop Burnet. This island, which More represents as having been discovered by a companion of Amerigo Vespucci, is the abode of a happy society, which, in virtue of its wise organisation and legislation, is free from the harassing cares, inordinate desires, and customary miseries of mankind. More's romance obtained a wide popularity, and the epithet *Utopian* has since been applied to all schemes for the improvement of society which are deemed not practicable—e. g., to those of Saint-Simon (q. v.) and Fourier (q. v.) Everything, however, is not Utopian that is called such. All the great changes that have taken place in the world have had to pass through a 'Utopian' phase.

U'TRAQUISTS (Lat. *utraquistæ*, from *utrâque*—i. e., *specie*, in both kinds), a name at first given to all those members of the Western Church, in the 14th c., principally followers of John Huss, who contended for the administration of the Eucharist to the laity under both kinds; but in later times restricted to one particular section of the Hussites, although all the members of that sect alike claimed this as a fundamental principle of their church discipline. The name may be said to date from 1415, when the followers of John Huss, in Prague, and elsewhere in Bohemia, adopted 'the communion of the cup' as their rallying cry, and emblazoned the cup upon their standards, as th distinguishing badge of the association. In 1417, the university of Prague, by a formal decision, directed that all the laity should communicate in

both kinds; and the Council of Constance, in consequence, prohibited students from any longer resorting to Prague for the purposes of study. The Hussite party, on the contrary, made the demand one (the second) of the four points upon which they insisted as the condition of their submission to the church. Their demands were rejected by the Council of Constance; but the Council of Basel, in 1433, acceded to the demand for the cup, under the condition that, whenever communion was so administered, the ministering priest should accompany the ministration with a declaration that Christ was contained whole and entire under each species. A portion of the Hussite party was content with the explanation of this and the other points offered by the council, but the more violent held out. See Huss. The former were called U., and continued to be so designated. During the Reformation troubles, this division was still maintained. The U. were favourably regarded by the imperial party; and after the battle of Mühlberg, in 1547, they alone were formally tolerated in Bohemia and Moravia. One of the most celebrated leaders was Jacobus v. Mies. The name Utraquist is still applied to certain districts or villages in Bohemia and Moravia; but it is used not in reference to this theological controversy, but merely to convey that, in these villages or districts, *both languages*, Bohemian and German, are spoken.

UTRECHT, a province of the Netherlands, bounded on the W. by South Holland, N. by North Holland and the Zuider Zee, E. by Gelderland, and S. by the Rhine and Leck. It is 42 miles from east to west, and 21 from north to south. Superficial extent, 346,405 acres; 62,500 of which are arable, 180,000 pasture, 39,000 in wood, the remainder waste land and water. The chief places are Utrecht, Amersfórt, Rhenen, Wijk bij Duurstede, Montfórt, and Ijsselstein (pronounced I'sselstein). There are 86 country parishes. Pop. (1881) 197,638. Rather more than 36 per cent. are Roman Catholics; the remainder, except 1600 Jews, are Protestants.

The country is varied by beautiful hilly districts, level fields, orchards, tilled land, meadows, and moss. The hilly tract stretches from near Amersfórt to Rhenen on the Rhine, 21 miles. It is well wooded. Rye, oats, and buckwheat are sown; sheep, cattle, and bees extensively kept. To the south of this belt is rich clay land, producing excellent wheat and barley. Near Amersfórt and Rhenen, tobacco is largely planted, the crop of 1865 being 948,750 lbs. The stock amounted to 12,771 horses, 76,989 horned cattle, 32,997 sheep, 20,547 swine, 4678 goats, and 13,835 bee-hives.

U. is watered by the Rhine, Vecht, Leck, Amstel, Grebbe, and many other rivers. The inland fishing is trifling; but many herrings, eels, flounders, anchovies, &c., are taken in the Zuider Zee. Besides agriculture, the industries are soap-boiling, sawing wood, copper and iron founding, making machinery, carpets, tiles, bricks, coarse pottery, cement, &c. There are many beautiful country-seats, the climate being dry and healthy.

UTRECHT (*Ultrajectum* or *Trajectum ad Rhenum*), the provincial capital, is beautifully situated in the midst of a district composed of sandhills, woody heaths, rich grassy meadows, extensive orchards, flower-gardens, and cultivated fields. It ies 24 miles south-east from Amsterdam. Pop. (1884) 74,365; births during the year 1865, 2301; deaths, 1538. The broad walls have been levelled, planted with trees, and formed into beautiful and well-kept promenades.

U. is favourably situated for trade, being the point from which several railways radiate, and having excellent water-communication by the Old Rhine and the Vecht. The staples are grain, cattle, and various manufactures. It is the residence of many noble families, the seat of a university, national veterinary school, national hospital, high military court, the mint, &c. Principal buildings are the cathedral or Domkerk, the town-house, the mint, the university, and several handsome barracks for the infantry and cavalry, especially the Willems-kazerne. The cathedral was consecrated to St Martin about 720. In 1674, a hurricane destroyed the body of the building between the choir and the tower, so that the latter is now isolated. It is 321 feet in height.

In 1864, the students of theology numbered 187, law, 210; literature, 14; medicine, 63; philosophy, 31. A good library is attached to the university. There is a national school, for military surgeons; a grammar-school; normal school for teachers; a musical college, for elementary singing, the piano, and violin; a historical society; meteorological institute; medical society; pharmaceutical society, &c. Education generally stands high.

The charitable institutions are numerous. Principal industries are—manufacturing tobacco and cigars, woollen fabrics and carpets, making salt, furniture, baskets, tin, copper, and silver work, sawing wood, rope-making, iron-founding, book-printing, &c. The royal cigar factory alone makes 40,000 daily.

U. is one of the oldest cities of the Netherlands, and probably was founded by the Romans. Here the famed union of the northern provinces for the defence of political and religious freedom was formed January 23, 1579. For a short time in 1807, Louis Napoleon, king of Holland, resided in Utrecht. It has been the birthplace of many distinguished men, among others Pope Adrian VI., in 1459.

U. has acquired a degree of celebrity for the treaties there concluded, which brought to a close the war of the Spanish Succession. See Succession Wars. After this disastrous conflict had endured for more than ten years, Great Britain, finding that the reasons which had prompted her to engage in it no longer existed, tried to induce Austria to come to terms with France, but failing in this, at once signed private preliminary articles for herself, October 8, 1711. On January 12, 1712, a congress was opened at U.; and France, desirous, at almost any price, of detaching Britain from the grand alliance, voluntarily made so many concessions, that the latter had only further to demand the banishment of the elder Pretender, whose sojourn in France had been a source of disquietude, the conclusion of a treaty of commerce, and indemnities for her allies—all which points were at once conceded. But the preposterous demands of Austria, which included not only the renunciation by the Bourbons of the entire Spanish Empire, but the restoration of all those places which had been ceded to France by the treaties of Münster, Nimeguen, and Ryswick, and the retention of all Austria's conquests in Italy, the Low Countries, and Spain, forced the French to break off the conferences, in the hope of making a separate peace with Britain, and compelling the other allies, by negotiation or arms, to lower their pretensions. This plan was successful; agreement on all points at issue was established betwee France and Britain in August 1712; and arrangements were also come to with Holland, Portugal, Prussia, and Savoy soon afterwards. As each of the contracting parties negotiated in its own name, no fewer than nine distinct treaties of peace were

signed in the following spring, 11th April 1713. By the treaty between France and Britain, the former ceded St Kitt's, Hudson's Bay, Nova Scotia, and Newfoundland (the liberty of fishing for cod being reserved), recognised formally the reigning dynasty and the Hanoverian succession, agreed to demolish the fortifications of Dunkirk, engaged that the crowns of France and Spain should never be united, and that no part of the Spanish Netherlands should ever be ceded or transferred to France; and Spain renounced her Italian possessions in favour of Austria, and gave up Gibraltar and Minorca to Britain, with which power she also concluded the *Assiento* (q. v.) treaty. The chief of the special agreements with the other contracting parties were as follows: Ypres, Knocke, &c. to be exchanged with Holland for Douai, Bouchain, &c., and a treaty of commerce to be concluded; both banks of the Amazon to belong to Portugal; Spanish Gelders, and the district of Kessel, to be ceded to Prussia, and its ruler's title of king, assumed in 1701, formally recognised, Prussia in turn resigning all claims to the principality of Orange; the Duke of Savoy to obtain Sicily, with the title of king, &c. The treaty of U. did not make peace with Austria and the German Empire; but in the following year, at Rastadt and Baden, they agreed to substantially the same terms as were proffered at Utrecht. The electors of Cologne and Bavaria, who had been put under the ban of the empire, were restored; Sardinia, granted to Bavaria at U., was restored to Austria; Austria renounced her claims to the Spanish succession; the cession of the Spanish possessions in Italy was confirmed; Brisach and Freiberg, in the Breisgau, were also given to Austria; the highest ridge of the Maritime Alps was made the boundary between France and Savoy; and on failure of the Spanish Bourbons, the crown of Spain was to fall to the House of Savoy.—See Lord Mahon's *History of the War of Succession in Spain* (Lond. 1832).

UTRE'RA, an old town of Spain, in the province of Sevilla, and 18 miles by railway south-east of the city of that name. In early times, it was flourishing and populous; but fell into a state of stagnancy, from which it has begun to revive, along with the rest of Spain. It is important as a military post, contains a beautiful Gothic church, a Moorish castle, and cavalry barracks. The streets and promenades are kept clean and fresh by streams of running water. U. contains upwards of 13,000 inhabitants, mostly agriculturists engaged in the productive estates which surround the town. Corn, wine, oil, and fruit are produced. Sheep and cattle, as well as a breed of fierce bulls, are reared in the vicinity.

UTTERING COUNTERFEIT COIN is an offence punishable with one year's imprisonment with hard labour. The punishment is increased if, besides uttering, the person has other counterfeit coin in his possession. It is also an offence to utter false foreign coin as the Queen's coin or as foreign coin.

UTTO'XETER, a market-town of Staffordshire, on an eminence above the vale of the Dove, 16 miles north-east of Stafford. A church with an ancient tower and lofty spire is the only noteworthy building. There are two large breweries in the town, with a rapidly increasing business.

U'VULA. See PALATE.

U'XBRIDGE, a market-town in the county of Middlesex, on the Colne, 15 miles west of the city of London. Pop. (1881) 7712. Its corn-market is one of the most important in the kingdom.

V

V THE twenty-second letter in the English alphabet, is derived directly from the Lat. character *v*, which represented originally both the consonant *v* and the vowel *u* (see U). The name of the letter is derived from the Phœnician and Hebrew *vau* (signifying a nail, which the form of the letter originally resembled), which stood sixth in the alphabet, and became the Digamma (q. v.) of the Old Greek, and the *f* of the Latin (see F). The Greek υ (see ALPHABET), from which the Lat. *v* is taken, had, in the classical period, degenerated into a sound like the French *u*, and in modern Greek is undistinguishable from *i*. The Greeks, after they had lost the digamma, represented Lat. *v* by ου or β; e.g., Ουαρρων or Βαρρων = Varro, Βιργιλίος = Virgilius. In the beginning of Latin words, *v* must have had a consonantal sound approaching that of *v* in English, as is inferred from its persistence as compared with the Greek digamma; e. g., Vinum = (Ϝ)οἶνος, Vesta = Ἑστία. Between two vowels, on the contrary, it was often dropped out, as in *nuper* for *novumper*, *Jupiter* for *Jovipiter*, *prudens* for *providens*; from which we may conclude that it had in that position the power of a semivowel, like Eng. *w*. In New High German, *v* takes the place of Gothic and Eng. *f* (see F), and is pronounced like *f*, while the *v*-sound is expressed by *w*.

VAAL RIVER, the Dutch name of one of the most important branches of the Gariep or Orange River, and signifying yellow, from the colour of its waters when in flood, its Hottentot name, Ky Gariep, having really the same signification; the Betjuans call it Namagari. It rises in the Mount of Sources, at the north-west angle of Natal, and running a very circuitous course of about 500 miles, forming the boundary between the Orange River Free State and the Transvaal Republic and Betjuana tribes, it joins the other great branch, the Nu Gariep or Orange River, in lat. 29° 10′ S., long. 24° 28′ E.

VACATION, in Legal language, means the holiday usually enjoyed by lawyers in consequence of many of the courts being closed, and thereby some steps in a suit not being competent during part of the autumn of each year. There are short vacations during other parts of the year; but the long vacation is that which extends from 10th August to 24th October, and during that part of the year it is usual for legal business to be in great measure suspended.

VACCINATION is the process by which a specific disease, termed *vaccinia*, or cow-pox (from the Latin word *vacca*, a cow), is introduced into the human organism with the view of protecting it against an attack of an incomparably more severe disorder—viz. smallpox. For the history of this remarkable discovery of vaccination—'that masterpiece of medical induction'—we must refer to the life of Jenner (q. v.). In his *Inquiry into the Causes and Effects of the Variolæ Vaccinæ*, published 1798, he establishes the following facts: (1.) That this disease casually communicated to man has the power of rendering him unsusceptible of smallpox; (2.) that the specific cow-pox alone, and not other eruptions affecting the cow, which might be confounded with it, had this protective power; (3.) that the cow-pox might be communicated at will from the cow to man by the hand of the surgeon, whenever the requisite opportunity existed; and (4.) that the cow-pox once ingrafted on the human subject, might be continued from individual to individual by successive transmissions, conferring on each the same immunity from smallpox as was enjoyed by the one first infected direct from the cow.

The *method of vaccinating* and the *phenomena of cow-pox*, as observed in the human subject after vaccination, claim our first and chief attention. Except under circumstances of special risk (as, for instance, where smallpox is in the neighbourhood), children should only be vaccinated when they are in apparently good health. Diarrhœa and skin-diseases are especially to be avoided; and it is important to see that there is no chafing behind the ears, or in the folds of the neck or groin. As more than one-fourth of the whole number of deaths from smallpox in England during the six consecutive years 1856—1861, took place in children of less than one year, it is obviously expedient that children should be vaccinated in very early infancy, provided health permits. Dr Seaton, in his comprehensive article on this subject in Reynold's *System of Medicine* (1866, vol. i. p. 489), observes that 'plump and healthy children living in large towns should be vaccinated when a month or six weeks old; in more delicate children, the vaccination might be postponed till they are two or three months old; but all, except those whose state of health positively contra-indicates vaccination, should be vaccinated by the age of three months.' This early age has also the advantage of being free from the irritation of teething.

The lymph to be used should always be taken from a healthy child, and from thoroughly characteristic vesicles; and when lymph in all respects satisfactory cannot be procured, as is often the case in country districts, the operation should be postponed. Lymph is usually taken when the vesicle is fully formed, which is usually about a week after vaccination; if it is not taken till the areola (which will be presently described) is complete, its protective power is far less certain. 'Prime lymph,' says Dr Seaton, 'has always a certain degree of viscidity; and a thin serous lymph, even from a vesicle which is not advanced, is to be avoided. Babies are much better lymph-givers than elder children or adults and children of dark complexion, not too florid, with a thick, smooth, clear skin, yield the finest and most effective lymph.' Lymph should always, if practicable, be passed direct from arm to arm; and preserved lymph should only be had recourse to when a vaccinated child cannot be obtained. A

good vesicle freely punctured on its surface exudes enough lymph or vaccine matter for the direct vaccination of five or six children, and for charging six or eight ivory points for future emergencies. The process of vaccination consists essentially in introducing the lymph into the structure of the true skin, or in bringing it in contact with the absorbing surface. This may be effected in various ways, one of the most common being by puncture. As the operation is extremely simple, and the knowledge of the mode of performing it may prove useful to many of our readers, we shall briefly describe it. The skin on the outside of the arm, below the shoulder, should be held upon the stretch, and a very sharp, clean lancet, well charged with lymph, should be made to puncture the skin from above downwards, at an angle of about 45°, and be made just to enter the true skin. The matter thus inserted is retained by the valvular character of the puncture and the elasticity of the skin. In this form of the operation, not less than five or six such punctures should be made, at a distance of half an inch from the other; and for the sake of security, three punctures may be made on each arm. If the lymph is preserved on points, each point, after being held in the steam of hot water so as to dissolve the lymph, should be inserted into the punctures made by an ordinary lancet. Some surgeons make a number of minute superficial punctures over a patch of the size of a fourpenny-piece, and spread the lymph over this spot with the flat part of the lancet: this kind of tattooing should be repeated on three spots. Others make a number of parallel scratches, or crossed scratches, with a charged lancet; and others, again, use special scarifiers or rakes, consisting of three or four needle-points inserted in an ivory handle, and drawn either once or again at right angles over the tense skin, the lymph being then plastered over the scarified surface. Of these various plans, Dr Seaton believes that the best marks and most successful treatment result from this last plan of cross-scratches. A far better plan of preserving lymph than that of drying it on points, is that of preserving it in a fluid state in Husband's closed capillary tubes, in which form it is ready for use without any preparation. When the operation is successfully performed, the skin at the spot becomes slightly elevated, hard, and red, on the third or fourth day; on the fifth or sixth day, a vesicle of a bluish-white colour forms, which presents an elevated edge and a depressed cup. It is distended with clear lymph, and attains its perfection on the eighth day; and now, or on the ninth day, the vesicle is surrounded by an inflamed ring or areola; on the ninth, tenth, and eleventh days, the vesicle becomes a pustule, the cupped form disappears, the areola enlarges till it becomes a circle, with a diameter of from one to three inches. On the twelfth, thirteenth, and fourteenth days, the pustule dries up; and in the course of the next week, the scab separates and falls off: it seldom remains so long as the twenty-fifth day. It leaves a cicatrix, which commonly is permanent in after-life, circular, somewhat depressed, dotted or indented with minute pits, and in some instances radiated. The establishment of the areola is accompanied with constitutional disturbances, as indicated by restlessness and heat of skin, frequent derangement of the stomach and bowels, and occasional swelling of the glands of the armpit. These symptoms are seldom severe, but seldom quite absent. We occasionally meet with cases in which the course of the above symptoms is modified, as when they are simply retarded, or simply accelerated, or altogether irregular and spurious; and it should be carefully borne in mind that 'a vaccination presenting any deviation from the perfect character of the vesicle and the regular development of the areola, is not to be relied on as protective against smallpox.'—Seaton, *op. cit.* As a general rule, neither the local nor the constitutional symptoms of ordinary vaccination require any treatment.

From recent investigations, conducted by order of the government, and published in several of the *Reports of the Medical Officer of the Privy Council*, it appears that amongst the poorer classes, vaccination is often so imperfectly performed as to leave no mark, and to exert no protective power. Mr Marson of the Smallpox Hospital believes that with good lymph, and the observance of all proper precautions, a good vaccinator should not fail of success in his attempts to vaccinate above one in 150 cases; while Dr Seaton puts one failure as a fair proportion in 170 cases.

The official inquiries above referred to, in the course of which the arms of nearly half a million vaccinated children were examined, prove, says Dr Seaton, who was employed in the investigation, the great extent to which imperfect or insufficient vaccination has obtained: taking the country throughout, not more than one child in eight was found to be so vaccinated as to have the highest degree of protection that vaccination is capable of affording; and not more than one in three could, on the most indulgent estimate, be considered as well protected. The main causes of this imperfect success were the following: '(1.) The frequency with which practitioners, instead of attempting fully to infect the system, had been satisfied with insertions of lymph sufficient to produce only one, two, or three ordinary vesicles; (2.) the want of due attention to the *selection* of the lymph used in vaccinating; (3.) carelessness and clumsiness in the performance of the vaccination, so that, if the operation did not wholly fail, it very frequently resulted in a less degree of effect than it had been the aim of the operator to produce; and (4.) the great and unnecessary extent to which the use of preserved and conveyed lymph was substituted for vaccination direct from the arm.'—Seaton, *op. cit.*, p. 503. The following observations made by Drs Buchanan and Seaton during the epidemic of smallpox in London in 1863, on upwards of 50,000 children in various national and parochial schools, workhouses, &c., are of such extreme importance that we make no apology for inserting them. Some of the children had never been vaccinated; the large majority had been vaccinated in various manners and degrees. Of every 1000 children without any mark of vaccination, no fewer than 360 had scars of smallpox; while of every 1000 children who had evidence of vaccination, only 1·78, on an average, had any such traces: and with regard to the quality and amount of the vaccination, it was found that, of children having four or more cicatrices, only 0·62 per thousand had any trace of smallpox; while of those who had a single bad mark, 19 per thousand were scarred by smallpox. Hence the best vaccination was more than thirty times as protective as the worst, and the worst was more than forty-seven times better than none at all. The importance of the completeness of the vaccination, as shewn by the cicatrices, is also well shewn by the results obtained by Mr Marson. From the study of more than 15,000 cases at the Smallpox Hospital, he finds that while the unvaccinated died at the rate of 37 per cent., the vaccinated have died at the rate of only $6\frac{1}{2}$ per cent.; the mortality amongst those with four or more scars being only 0·55, while that amongst those with only a single scar was 7·73 per cent.; so that, while the average risk which vaccinated

persons run if they do catch smallpox is about one-sixth of the risk run by unvaccinated persons, well-vaccinated persons run less than one-seventieth part of the risk. It must further be borne in mind, that while few unvaccinated persons do not at some period of life sustain an attack of smallpox, the cases are comparatively rare in which a well-vaccinated person catches the disorder; so that the protective power of vaccination shews itself in two ways—viz. (1.), in shielding the constitution, in the great majority of cases, from any kind of an attack of smallpox; and (2.) in the exceptional cases, of so modifying the disease, as almost invariably to deprive it of danger to life, or of those terrible disfigurements which the unmodified disease so frequently left behind it.

Whether the protective power of vaccination lasts through life, or, as many physicians hold, gradually wears out in a certain number of years, is still an open question. It is, however, the safer course to adopt the second view, and to re-vaccinate at intervals (every seven years, for instance), especially after the evidence that has been adduced of the imperfect way in which the operation is often performed. Dr Seaton adopts a medium course, and holds that 'one thoroughly good primary vaccination to start with, and one careful re-vaccination after puberty, are all that is necessary for the complete protection of the population against smallpox.' Even in those who had good scars, the second operation is often more or less successful. Thus, in 13,861 cases in which re-vaccination was performed in the Würtemberg army, the operation was quite successful in 31 per cent., partially so in 28 per cent., and totally failed in 41 per cent.

Much has been written regarding the *dangers of vaccination;* and the well-known Rivalta case, in which an infant thus communicated syphilis to a whole population in a remote district of Piedmont (see SYPHILIS); and the recent death of a distinguished middle-aged baronet from (as it was alleged) vaccination with impure lymph, have recently directed special attention to the subject. See Mr Simon's *Papers relative to the History and Practice of Vaccination;* and Dr Henry Blanc's *Human Vaccine Lymph and Heifer Lymph compared.* The latter asserts that a kind of skin disease and syphilis have been unmistakably transmitted by vaccination. Other practitioners assert that blood-poisoning in vaccination is due to the inlet of organic particles from the atmosphere.

The relations between smallpox in man and cow-pox in the cow, claim a passing remark. Jenner believed that they were essentially the same disease, and that they had a common origin in the grease of the horse. Various experiments have been made to inoculate healthy cows with smallpox, and those of Mr Ceely of Aylesbury in 1839, and of Mr Badcock of Brighton in 1840, who induced vesicles by inoculating cows with smallpox virus, and thus obtained a supply of genuine vaccine lymph, place the identity of the diseases beyond all question. The disease really known as grease appears to have nothing to do with cow-pox or smallpox; but the horse occasionally suffers an affection which is precisely the same as the smallpox in man and the cow-pox in cows; and the lymph from this horse-pox has been successfully used for vaccination.

In conclusion, a brief paragraph must be given to the legal bearings of the question. In 1841, the Vaccination Act was passed, which made the practice of inoculating with smallpox virus unlawful. In 1853, another act, known as Lord Lyttelton's Vaccination Act, was passed, with the view of rendering the practice of vaccination compulsory. This act, although useful as far as it goes, has, however, proved inefficient, and it was hoped that an amended Bill, before the Houses in the spring of 1866, would have been carried. The Public Health Act, passed in 1858, gives to the Privy Council the power of issuing such regulations as they may think fit for securing the due qualification of persons to be contracted with for the vaccination of poor persons resident in unions and parishes, and for securing the efficient performance of vaccination. One of the most important indirect results of this power in their hands is the appointment of *public vaccinators,* to give instructions in all the practical points bearing on vaccination, and in fit cases to give certificates of proficiency. They have, moreover, made arrangements for supplying lymph, guaranteed by the National Vaccine Board, to all medical practitioners who apply to 'The Registrar of the National Vaccine Establishment, Privy Council Office, London, S.W.'

VACCINIA'CEÆ, a natural order of exogenous plants, differing from *Ericeæ* chiefly in having an inferior ovary and succulent fruit. Many botanists make it a section of *Ericeæ.* About 200 species are known, natives of temperate climates, in all parts of the world, but chiefly in the northern hemisphere. A few species, remarkable as being parasitic, are natives of Peru. The V. are shrubs, and rarely small trees, with numerous round or angular branches, simple leaves on very short stalks, and flowers solitary or in racemes. Whortleberries (q. v.) and Cranberries (q. v.) are the most familiar examples of the order.

VÂCH (literally, speech) is another name of Saraswatî (q. v.), the female energy of the Hindu god Brahman.

VÂCHASPATI (literally, 'lord of speech,' from the Sanscrit *vâch*, speech, and *pati*, lord) is, in Hindu Mythology, one of the usual names of *Vr'ihaspati* (q. v.), the instructor of the gods.

VA'CUUM literally means empty space, or space wholly devoid of matter. From Aristotle to Descartes, metaphysical speculators took the question into their own hands, and, of course, wrote nonsense about it. Thus, Descartes commits the absurdity of saying that, if a vessel be perfectly empty, its sides must be in contact—confounding the totally distinct ideas of *matter* and *space.* The dictum that *nature abhors a vacuum,* was employed to account for the rise of water in pumps; but it was presently found that nature did not abhor a vacuum through more than an elevation of about 32 feet. See TORRICELLI. When the subject was taken up by its legitimate owners, the experimental philosophers, such absurdities disappeared, but real difficulties were detected. So far as experiment has yet guided us, we may assert that vacuum cannot exist. The interstellar spaces, though probably devoid of ordinary ponderable matter, or at best only occasionally visited by it, are certainly pervaded by the luminiferous medium. See ETHER, UNDULATORY THEORY. That this is Matter (q. v.), is amply proved by the effects of its vibrations on the eye, and by the resistance which it has been discovered to oppose to the motion of Encke's comet. It is not merely for the propagation of light and heat that we are forced to assume that the universe is a *plenum;* Newton expressly said (see FORCE, where the quotation is given at greater length) 'That gravity should be innate, inherent, and essential to matter, so that one body may act upon another at a distance through a *vacuum,* without the mediation of anything else, by, and through which their action and force may be conveyed from one to another, is to me so great an absurdity, that I believe no man who has in philosophical matters a competent

faculty of thinking, can ever fall into it.' Nothing could be stronger than this; and we have, in addition, the results of modern observation, which shew a connection between sun-spots, planetary configurations, and terrestrial magnetism, obviously requiring some material channel to exist between the sun and its secondaries. Faraday's electrical discoveries tend to the same conclusion.

But, in ordinary language, a vacuum is said to be produced (more or less *perfect*) when ordinary ponderable matter, such as air, is more or less completely removed from the interior of a closed vessel. Till the commencement of the present century, the most perfect vacuum that could be obtained was what is called the Torricellian vacuum—i. e., the space above the mercury in a carefully filled barometer tube. Such a vacuum, however, is almost useless for experimental purposes, and, besides, it contains mercurial vapour.

A suggestion of Davy's, recently re-invented and greatly improved by Andrews, gives the means of procuring a much more perfect vacuum than the Torricellian. An ordinary air-pump removes all but about the $\frac{1}{120}$th of the gas in the receiver—i. e., produces a vacuum of about $\frac{1}{4}$th inch, as it is called. But if the gas employed be carbonic acid, admitted and pumped out several times, so as to get rid, as far as possible, of the last trace of air, the remaining gas will be almost wholly taken up by means of moistened caustic potash previously placed in the receiver. Concentrated sulphuric acid should also be present, to desiccate the potash when it has done its work. In this way, Andrews easily obtained a vacuum of about $\frac{1}{4600}$th of an inch, which remained unchanged for a fortnight. Here all but $\frac{1}{135,000}$th of the air had been removed. Farther improvements, devised by Frankland, Gassiott, and others, have been made in this process, especially for the production of (so-called) vacuum-tubes for the study of electrical discharges; and the exhaustion has been sometimes carried so far that the attenuated matter remaining was unable to conduct the discharge of an induction-coil.

VA'GRANTS, or TRAMPS, a class of beggars, many thousands in number, who, having their headquarters in the large towns of England, wander about the country, subsisting upon charity and plunder. In England, the spirit of the laws and still more public opinion have always been averse to putting restraints upon the inclinations of even viciously disposed persons, and, consequently, the country has never been without a class of habitual vagrants—beggars and pilferers by profession. But there is reason to believe that the number of these social pests has, for many years past, been declining, absolutely, as well as relatively to population. The statute-book has long contained laws against vagrancy, but they have never been systematically executed. The severest of the early laws were directed against the gipsies—at one time a really formidable class of vagrants—and against wandering soldiers and marines, and persons pretending to be discharged soldiers and marines. Such vagrants were made liable to the punishment of felony. The vagrancy laws are now comprised in the acts 5 Geo. IV. c. 83, and 1 and 2 Vict. c. 38, supplemented to some extent by provisions contained in local police acts. Those statutes (using the descriptive phrases of previous enactments) made idle and disorderly persons—that is, persons able, in whole or in part, to maintain themselves and their families, and neglecting to do so—liable to one month's imprisonment and hard labour; rogues and vagabonds (habitual vagrants and persons suspected of living by crime), liable to three months' imprisonment and hard labour; and a third class, described as incorrigible rogues, liable to be committed for trial at the Sessions, to be kept to hard labour in the interim, and after conviction, to be sentenced to one year's imprisonment and hard labour, with whipping in the case of males. The police have authority to enter houses of reception for travellers, and to arrest persons suspected of falling under any of the above-named descriptions, and carry them before a magistrate for trial. But between the difficulty of finding satisfactory evidence of the character of persons thus found wandering, the commendable fear of making mistakes, the popular feeling that vagrancy is not a crime, and the unwillingness of magistrates to add to the expense of prison establishments, the statutory powers have never been used to such an extent as to affect the prevalence of vagrancy.

On the other hand, a direct and material support has been given to vagrancy by the arrangements which, under the new poor-law, now exist in most districts for the relief of the travelling poor. In almost every union workhouse in England there is a casual ward, intended for poor artisans and labourers making their way, as they sometimes have to do, from places where work is slack to places where it is plentiful. The casual ward has been taken possession of by the vagrant, for whom the law provides only a prison-cell. From two-thirds to three-fourths of its occupants are usually habitual vagrants. Here the vagrant gets his supper, his bed, and in most cases his breakfast. The fare is exceedingly meagre—a little bread, with occasionally a bit of cheese, or a small quantity of skilley (gruel); and the sleeping accommodation is usually worse than that of the lowest lodging-houses—cleanliness being impossible with such occupants, and there being no desire to give them comfort. But the vagrant gets supplies of food in his wanderings by begging and plundering; and he seeks the casual ward chiefly for the shelter and the society. In 1848, Mr Charles Buller, then President of the Poor-law Board, prescribed a set of rules, which for a time almost deprived the vagrant of this resource. Relief was to be refused to all able-bodied young men unless they produced passes or certificates declaring their character from a clergyman or some person in a public position, or unless the workhouse officials were satisfied they were actually destitute; orders for the casual ward were to be given only by the police—whom the tramp regards as his natural enemies; and a suitable task of work was to be exacted from every person relieved. But these rules were soon withdrawn. In a good many cases, the police are still employed to give away the orders, and on the whole with advantage; but passes (this was the really valuable regulation) are not required; and in not a few cases, no task of work is exacted, because the poor-law guardians found that they lost money upon the work done by vagrants. In other cases, an option is given to the tramp of doing a certain amount of work, or going away in the morning without his breakfast. He almost always prefers the latter alternative. But, in general, about three hours' work is imposed; and when the workhouse authorities insist upon it, the vagrants usually—though greatly disliking work—comply with this condition.

By far the greatest number of the vagrants are men between the ages of 20 and 40, the average age being about 34. There is a small proportion of men above 40, and about an equal number of youths under 20—mostly runaway apprentices. About a fourth or a fifth are women, who are generally travelling with male vagrants; but the life seems to be too hard for women. The men often pretend to be going about in search of work, but seldom or never do work; and the majority of the vagrants

are of the class who, from mental constitution, would almost die rather than work. They are, besides, it must be added, persons whom decent labourers would not allow to be associated with them. Many of them have been brought up in workhouses; others are deserters from the army, or discharged soldiers of bad character; not a few are dissipated broken-down workmen, who, while tramping about in search of work, have acquired the tramp's bad habits and love of idleness. Many of them have been brought up to crime, but want the skill and daring necessary to success in their profession. They often make some pretence of occupation, under cover of which they approach houses to beg, or steal, or bully unprotected women. They are vendors of steel-pens, paper, laces; tinkers, china-menders, umbrella-repairers, ballad-singers. They are much given to small thefts; most of them are believed to be capable of any crime; but in fact they attempt few serious crimes. They are poor timid creatures, and feel that society with its police is too strong for them. They never unite together to commit crimes, but occasionally 20 or 30 of them, operating in twos and threes, work a district in concert. There is a free-masonry among them; and any new rule adopted at a workhouse becomes known in two or three days over a wide district. They are usually known by slang names; their language is horribly blasphemous and obscene; and neither men nor women have the smallest regard for decency, or any conception of sexual restraints. They give a great deal of trouble at the workhouses—swearing at and threatening the officials, occasionally stabbing them, refusing to do the allotted work, and not unfrequently tearing up their clothes, in the hope that the officials, out of regard to decency, will supply them with others. The officials can only threaten them with the magistrate and the jail; but sometimes—and it is then they are most insolent and troublesome—they have a desire for rest and regular feeding, and are not unwilling to go to jail. It is hard to understand what are the enjoyments of their wandering and shifty life. Apparently, the freedom of it and the immunity from work are its chief attractions. They have been well described as wandering about 'ready for any crime, but not planning crimes, quite ready to rob, but very much afraid of large dogs, very courageous against unprotected women, but skulkers when a broad-shouldered labourer turns his eyes their way, with no purpose except wandering, no restraint except hunger, no hope except of getting drunk upon some lucky haul, nomads in the midst of civilisation, simple savages without savage resources.' The revival of the regulations prescribed by Mr Buller, and the steady enforcement of the vagrancy laws—which should also be made more severe—are the measures most likely to put down vagrancy. There is no offence against society for which penal servitude would be a more appropriate penalty.

VAIR. See HERALDRY.

VAIS'ESHIKA is the name of one of the two great divisions of the *Nyâya* (q. v.) school of Hindu philosophy, and probably a later development of the Nyâya itself, properly so called, with which it agrees in its analytical method of treating the subjects of human research, but from which it differs in the arrangement of its topics, and more especially by its doctrine of atomic individualities or *vis'eshas*—whence its name is derived.

The topics or categories (*padârthas*) under which *Kan'âda*, the founder of this system, arranges his subject-matter, are the following six: (1) substance, (2) quality, (3) action, (4) generality, (5) atomic individuality, and (6) co-inherence; and later writers of his school add to these a seventh category, viz., non-existence. 1. Substance is the intimate cause of an aggregate effect; it is that in which qualities abide, and in which action takes place. It is ninefold, viz., earth, water, light, air, ether, time, space, soul, and *manas*, or the organ of affection. 2. Quality is united with substance; it comprises the following 24: colour, savour, odour, feel, number, dimension, severalty, conjunction, disjunction, priority, posteriority, gravity, fluidity, viscidity, sound, understanding, pleasure, pain, desire, aversion, volition or effort, merit, demerit, and self-restitution. 3. Action consists in motion, and abides in substance alone. It affects a single, that is, a finite substance, which is matter. Action is either motion upwards or motion downwards, or contraction or expansion, or motion onwards. 4. Generality abides in substance, quality, and action. It is of two kinds, higher and lower—genus and species. 5. Atomic individuality resides in eternal substances, by which are meant the organ of affection, soul, time, space, ether, earth, water, light, and air; it is the ultimate difference, technically called *vis'esha;* such differences are endless; and two atoms of the same substance, though homogeneous with one another, differ merely in so far as they exclude one another. 6. Co-inherence, or perpetual intimate connection, resides in things which cannot exist independently from one another, such as the parts and the whole, quality and the thing qualified, action and agent, species and individual, atomic individuality and eternal substance. 7. Non-existence, the last category, added to the foregoing by the modern Vais'eshikas, is defined by them as being either non-existence, which is without beginning, but has an end—as that of a jar, which did not exist until its antecedent non-existence ceased when being formed out of the clay; or non-existence, which has a beginning, but no end—as that of a jar which is smashed by the blow of a mallet; or absolute non-existence, which, extending through all times, has neither beginning nor end—as when it is said that a jar is not on the ground; or mutual non-existence, which is the reciprocal negation of identity—as when it is remarked that a jar is not a piece of cloth. The nature of each of these substances, qualities, actions, &c. is, then, the subject of special investigation. Thus, *earth* is said to be that of which the distinguishing quality is odour; it is described as being of two kinds: eternal, in its atomic character; and uneternal, when in the shape of some product. Again, products are defined as either organised bodies of five sorts, or organs of perception, or unorganic masses, such as stones, &c. Amongst the qualities, colour is defined as that quality which is apprehended only by the sense of sight; which resides in earth, water, and light; which is distinguishable in earth as white, yellow, green, red, black, tawny, and variegated; in water, as white, but not resplendent; in light, as white and resplendent, &c. *Self-restitution*—to give another instance of the definition of the qualities—is described as threefold: as impetus, the cause of activity in earth, water, light, air, and the organ of affection; as the mental process peculiar to the soul, which is the cause of memory; and as elasticity, in mats and similar substances, which causes an altered thing to reassume its former position.

Though this cursory statement must here suffice to give a general idea of the Vais'eshika system, it is worthy of especial notice that, according to it, understanding is the quality of *soul*, and the instruments of right notion are treated of under the head of 'understanding (*buddhi*).' Kan'âda admits of only two such instruments, or *pramân'as*, viz.

knowledge which arises from the contact of a sense with its object, and inference. Comparison, revelation, and the other instruments of right notion, mentioned in other systems, the commentators endeavour to shew are included in these two. Fallacies and other modes of inconclusive reasoning are further dealt with in connection with 'inference,' though with less detail than in the Nyâya, where these topics are enlarged upon with particular predilection.—The reputed founder of the V. is *Kan'âda*, which name the native authorities derive from *Kan'a*, minute, and *âda*, eating, and sometimes, therefore, also change into *Kan'abhuj* or *Kan'abhaksha* (*bhuj* and *bhaksha* being synonyms of *âda*). Nothing, however, is known as to the history or date of this personage, as they are involved in the same obscurity which covers most of the renowned writers of ancient India. His work is divided into ten *adhya'yas*, or books, each of which is subdivided into two diurnal lessons; these, again, being subdivided into sections containing two or more *Sûtras* (q. v.), or aphorisms, on the same topic. Like the Nyâya-Sûtras, the work of Kan'âda has been commented upon by a triple set of commentaries, and popularised in several elementary treatises. The text with the commentary of *S'ankara Mis'ra*—who is not to be confounded with the celebrated Vedânta author—has been edited at Calcutta in 1861 by the Pan'd'it Jayanârâyana Tarka Panchânana, who added to it a gloss of his own; and some of the Sûtras have been translated by the late Dr Ballantyne (Mirzapore, 1851). Of later works on the same system, may be mentioned the *Bhâshâparichchheda*, edited, with the commentary called *Siddhântamuktâvalî*, and translated by the late Dr Roer in the *Bibliotheca Indica* (Calcutta, 1850), and the popular *Tarkasangraha* in several editions; edited also and translated by Dr Ballantyne (2d edit., Calcutta, 1848), who in his preface gives a catalogue of the commentaries which this work has elicited. The reader not acquainted with Sanscrit is, for further information on the subject, referred to these translations, and to the essays on the V. system by H. T. Colebrooke (*Miscellaneous Essays*, vol. i., Lond. 1837), and Professor M. Müller, in the 6th and 7th volumes of the *Zeitschrift der deutschen morgenländischen Gesellschaft*.

VAISHN'AVAS is the name of one of the three great divisions of Hindu sects. See INDIA, section *Religion*. The word, derived from *Vishn'u* (q. v.), designates the worshippers of this deity, and comprises a great variety of sects; but this variety itself differs according to different periods of the medieval history of India, old divisions becoming extinct, and new ones taking their place. Thus, the account of the V., as given in a celebrated work of *Anandagiri*, the *'Sankara-dig-vijaya*, or the victory of the great theologian S'ankara over his religious adversaries, would no longer apply in detail to the present condition of the V.; and even some of those varieties mentioned by the late Professor Wilson in his *Sketch of the Religious Sects of the Hindus*, written in 1832, would seem to have disappeared already in our days. The common link of all the sects comprised under the name of V., is their belief in the supremacy of Vishn'u over the other gods of the Trimûrti (q. v.). Their difference consists in the character which they assign to this supremacy, and to the god Vishn'u himself, in the religious and other practices founded on the nature of their belief, and in their sectarian marks. The following sects belonging to this category may especially be noticed here.

1. The *Râmânujas*, or *S'rî Vaishn'avas*, or *Srî-Sampradâyins*. They derive their origin from *Râmânuja*, a celebrated reformer, who was born at Perumbur, in the south of India, about the middle of the 12th c., and is considered by his followers as an incarnation of *S'esha* (q. v.), the serpent of Vishn'u. He studied at Conjeveram, resided afterwards at S'rîranga, and then travelled over different parts of India, where he was especially engaged in combating the professors of different creeds, particularly the S'aivas. On his return to S'rîranga, he was seized by the king Kerika'la Chola, but effected his escape, and found refuge with the Jain king of Mysore, Vitâla Deva, whom he converted to the Vaishn'ava faith. For twelve years he then remained at Mysore; but at the death of the Chola king, returned to S'rîranga, where he spent the remainder of his life in religious seclusion. The Râmânujas address their worship to Vishn'u and his consort, Lakshmî (q. v.), and their respective incarnations, either singly or conjointly. Hence their sect consists of corresponding subdivisions, according as Nârâyan'a or Lakshmî, or Lakshmî-Nârâyan'a, or Râma, or Sîtâ or Sîtâ-Râma, or any other incarnation of these deities, is the preferential object of the veneration of the votary. Their most striking peculiarity is the preparation and the scrupulous privacy of their meals; for should the meal during its preparation, or while they are eating, attract even the looks of a stranger, the operation is instantly stopped, and the viands buried in the ground. The marks by which they distinguish themselves from other sects are two perpendicular white lines, drawn with a white earth, *Gopîchandana*, from the root of the hair to the commencement of each eyebrow, and a transverse streak connecting them across the root of the nose; in the centre is a perpendicular streak of red, made with red sanders, or a preparation of turmeric and lime; other marks, representing several of the attributes of Vishn'u, they have either painted or impressed on the breast and each upper arm; and, besides, they wear a necklace of the wood of the Tulasî (holy basil), and carry a rosary of the seeds of the same plant, or of the lotus. The sacred formula with which a member of this sect is initiated into it consists merely of the words *Om râmâya namah'*, 'Om, salutation to Râma.' Their principal religious tenet is the belief that Vishn'u is the cause and creator of all worlds; that he and the universe are one, though he is of a twofold form: the supreme spirit or cause, and the gross one, the effect or matter. In distinction from the Vedânta, with which their doctrine has otherwise many points of contact, they regard their supreme deity as endowed with qualities, all of which are of course excellent; and teach that the universe consists of *chit*, thinking or spirit, *achit*, unthinking or matter, and *îs'wara*, or god; the relation of which is that of enjoyer, the thing enjoyed, and the ruler of both. The deity, they assume, is or has been visibly present in five modifications; in the objects of worship, as images, &c.; in the incarnations (see under VISHN'U); in certain forms called Vyûhas, viz., Vâsudeva, or Kr'ishma; Balarâma, Pradyumna, and Aniruddha; and in the subtle form which comprises six qualities—absence of passion, immortality, exemption from pain or care, absence of natural wants, love, and practice of truth—and the human soul; all of which have to be worshipped seriatim, as the votary ascends in the scale of perfection. The chief authoritative works in Sanscrit of this sect are the *Vedânta Sûtras*, with several commentaries, several works on the Vedânta (q. v.) philosophy, the *Pancharâtra* of Nârada; of Purân'as (q. v.), the *Vishn'u*, *Nâradîya-*, *Garud'a-*, *Padma-*, *Varâha*, and *Bhâgavata Purân'a*; and besides, the works of *Venkat'a*, and several popular works in the dialects of the south. It is in the south that the followers

of Râmânuja, and their temples and establishments, are still numerous; in the north of India, where they are better known as *S'rî Vaishn'avas*, they are not of frequent occurrence.

2. The *Râmânandas*, or *Râmâvats*. They are by far the most numerous class of sectaries in Gangetic India: in the district of Agra, they alone constitute seven-tenths of the ascetic population. They belong chiefly to the poorer and inferior classes, with the exception of the Rajputs and military Brahmans. The founder of this sect was *Râmânanda*, who, by some, is considered to have been the immediate disciple of Râmânuja; by others, the fifth in descent from that teacher, when he would have lived about the end of the 13th c.; but other more reliable accounts place him toward the end of the 14th, or the beginning of the 15th century. According to common tradition, Râmânanda seceded from the Râmânujas, to whom he originally belonged, because, having spent some time in travelling through various parts of India, and, in consequence, having been suspected by his fellow-disciples not to have conformed to the rule of the Râmânujas in taking his meals, he was condemned to feed in a place apart from the rest of them, but did not acquiesce in the affront thus offered him. His residence was at Benares, at the Pancha Gangâ Ghât', where a *Math*, or monastery, of his followers is said to have existed. The especial object of their worship is Vishn'u, in his incarnation as *Râmachandra*, and his consort *Sîtâ*, and, as amongst the Râmânujas, these deities either singly or jointly. Some members of this sect also pay adoration to other forms of Vishn'u; and the religious mendicants of the sect consider all form of adoration superfluous, being content with the incessant invocation of Krishn'a and Râma. Their practices are less precise than those of the Râmânujas; but the most important difference between them consists in the fact, that Râmânanda abolished the distinction of caste amongst the religious orders, and taught that a *Vairâgin*, or one who quitted the ties of nature and society, shook off at the same time all personal distinction. The initiatory formula of a Râmânanda is *S'rî Râma*, or 'blessed Râma.' Their sectarian marks are the same as those of the Râmânujas; except that the red perpendicular streak on the forehead is varied in shape and extent, and generally narrower than that of the Râmânujas. There are various subdivisions of this sect, believed to have been founded by several eminent disciples of Râmânanda. Their doctrines vary often from that of the latter, but they maintain an amicable intercourse with the Râmânujas and with each other. The twelve chief disciples of Râmânanda were *As'ânand*, *Kabîr*, *Raidâs*, *Pîpâ*, *Sursurânand*, *Sukhânand*, *Bhavânand*, *Dhavana*, *Sena*, *Mahânand*, *Paramânand*, and *S'rî Anand;* and besides these *Nâbhâji*, the author of the Bhaktamâlâ, *Sûr-Dâs*, *Tulasî-Dâs*, the translator in Hindi of the Râmâyan'a, and the author of many popular works which exercise a considerable influence on the Hindu population, and the poet *Jayaadeva*, the author of the Gîtagovinda. Many legends, of course, are related of these personages, especially in the Bhaktamâlâ, the favourite work of this sect.

3. The *Kabîr Panthis*. The founder of this sect, one of the most interesting and important in Upper and Central India, except, perhaps, in Bengal itself, was Kabîr, the most celebrated of the twelve disciples of Râmânanda, before mentioned, who, therefore, probably lived about the end of the 14th century. The circumstances connected with his birth, life, and death are all related as miraculous; and so little is certain about his life, that even the Mussulmans claim him as one of their persuasion. But his great conversancy with the Hindu *S'âstras*, and his limited knowledge of the Mohammedan authorities, render such a supposition highly improbable. According to the doctrine of this sect, there is but one God, the creator of the world; but, in opposition to the Vedânta (q. v.), they assert that he has a body formed of the five elements of matter, and a mind endowed with the three *gun'as*, or qualities: he is of ineffable purity and irresistible power, eternal, and free from the defects of human nature, but in other respects does not differ from man. The pure man is his living resemblance; and after death, becomes his equal and associate. God and man are therefore not only the same, but both in the same manner everything that exists. For 72 ages, God was alone; he then felt the desire to renew the world, which desire assumed the shape of a female form; and this form is Mâyâ (q. v.), or illusion, with whom he begot the triad, Brahman, Vishn'u, and S'iva. He then disappeared, and Mâyâ approached her offspring, in order to frame the universe. Vishn'u hesitated to associate with her, and is therefore more respected by the Kabîr Panthis than the other two gods of the triad; but the latter were frightened by her, and the result of their submission was the birth of Saraswatî, Lakshmî, and Umâ, whom she wedded to the three deities to produce the world. To understand the falsehood of Mâyâ is, therefore, the chief aim of man; and so long only as he is ignorant of the source of life, he is doomed to Transmigration (q. v.), which, according to the belief of this sect, is also extended to the planetary bodies—a falling star or meteor being a proof, for instance, that it undergoes a fresh change. The moral code of the Kabîr Panthis is, in many respects, creditable to them. Life, they teach, being the gift of God, must not be violated by his creatures. Humanity and truth are two of their cardinal virtues; retirement from the world is deemed desirable; and implicit devotion, in word, act, and thought, to the Guru, or spiritual teacher, a supreme duty. But, as regards the latter point, it is characteristic that the pupil is enjoined first to scrutinize the teacher's doctrine and acts, and to be satisfied that he is the sage he pretends to be, before he resigns himself to his control. It is no part of their faith to worship any deity, or to observe any ceremonies and rites of the Hindus; but they are recommended outwardly to conform to all the usages of tribe and caste, and some even pretend to worship the usual divinities, though this is not considered justifiable. They have no peculiar mode of dress, and though some wear the sectarian marks of the V., and the necklace and rosary, all these outward signs are considered of no importance. Though, therefore, properly speaking, they can scarcely be included amongst the Vaishn'ava sects, yet their paying more respect to Vishn'u than to any other god of the Trimûrti (q. v.), and the fact of Kabîr having been a disciple of Râmânanda, also the friendly intercourse which they maintain with most of the Vaishn'ava sects, cause them always to be looked upon as belonging to them. The doctrines of Kabîr are taught in a great variety of works in different dialects of Hindi, all of which are the acknowledged compositions of his disciples and successors. The principal are the *Sâkhîs*, 5000 in number, consisting of one stanza each; the *Bîjak*, in 654 sections; and the *Sukh Nidhân*. The sect itself is split into a number of subdivisions, and twelve branches of it are traced to the following personages: *S'rutgopâl Dâs*, the author of the Sukh Nidhân—his successors preside over the Chaura at Benares; *Bhago Dâs*, the author of the Bîjak; *Nârâyan Dâs* and *Churâman' Dâs*, the two sons of a merchant at Jabbalpur; *Jaggo Dâs*, of Kuttack; *Jîvan Dâs*

Kamâl, of Bombay; *Tâk Sâlî*, of Baroda; *Jnânî*, of Majjhnî, near Sahâs'râm; *Sâheb Dâs*, of Cuttack; *Nityânand*, and *Kamâl Nâd*, in the Dekhan. The principal establishment of the sect is the Kabîr Chaura at Benares.

4. The *Vallabhâchâryas*, or *Rudra Sampradâyins*. The original teacher of this sect is said to have been *Vishn'u Swâmin;* but it is a later successor of his, *Vallabha Swâmin*, or *Vallabha Acha'rya*, who, from the influence which his teaching and writing exercised on the propagation of his doctrines, must be considered the real founder of this sect. He was born in 1479, in a forest called Champâran'ya, where his parents deserted him on a pilgrimage they had undertaken to Benares. The gods, of course, took care of the infant; and his parents, who recovered him afterwards, took him to Gokula, a village on the left bank of the Jumna, a short distance from Mathura, where he received his first education. In his twelfth year, he left this place, in order to propagate throughout India his tenets, which at that time, it must be understood, he had already framed. On arriving at a certain town in the south of India, he became acquainted with a person of influence, *Damoradâs*, whom he converted to his doctrine. Both of them then proceeded together to the city of Vijayanagar, where the maternal parents of Vallabha resided. He was now introduced to the court of the king of Vijayanagara, Krishn'adeva, and succeeded so well in his disputation with the S'aivas and Smârta Brâhmans, that not only the king bestowed on him rich presents, but the Vaishn'avas elected him as their chief, with the title of Âchârya, or spiritual teacher. He then travelled to Ujjayin, Allahabad, and Benares, and from there, for nine years, through different parts of India, until, on his return to Brindâvan, as a reward for his exertions and faith, he was honoured by a visit from the god *Kr'ishn'a* in person, who enjoined him to introduce his worship, and to found the religion now so widely diffused throughout Western India under the sectarian name of *Rudra Sampradâya*. Vallabha ultimately settled at Benares, and there composed 17 works in Sanscrit, the most important of which are a commentary on the Vedânta (q. v.) and Mimânsâ (q. v.) Sûtras, and one on the Bhâgavata Purân'a; works, however, only intended for the learned, and now very rare. He died on a hill in the vicinity of Benares, in his 53d year, after having made 84 devoted disciples. He was succeeded by his second son, *Vithalnâthji*, who was born in 1516, in the village of Parn'ât, and is known amongst the sect by the designation of S'rî Gosâin Jî, his father Vallabha's sectarian name being S'rî Achârya Jî. Vithalnâthji died in 1583, and left, besides four daughters, seven sons, who were all teachers, and formed as many communities; viz., *Girdharji* (born 1540), *Govinda Rây* (born 1542), *Bâlkr'ishn'aji* (born 1549), *Gokulnâthji* (born 1551), *Ragunâthji* (born 1554), *Jadunâthji* (born 1556), and *Ghanashyamji* (born 1561). It was, however, *Gokulnâthji* who became the most celebrated of the descendants of Vithalnâthji, for to him especially is due the vitality of this sect; and even to the present day the followers of his descendants consider their own Gosâins the only legitimate teachers of their faith, while even the adherents of the other sons of Vithalnâthji pay them the greatest respect. It is about the period when the sons of Vithalnâthji dispersed that they first acquired the title of *Mahârâj*, or 'great king,' by which the chiefs of this sect are now best known, though besides this proud designation they have other distinctive titles, such as *Vallabha Kula*, *Agni Tula*, *Guru*, &c. The heads of the Gokulnâthli division of this sect are usually called *Gokul Gosâins*, or *Gokulastha Gosâins*. The members of this sect are widely diffused throughout Bombay, Cutch, Kattywar, and Central India, and especially the province of Malwa. Their establishments and temples are numerous throughout India; especially at Mathura, Brindâvan, and Benares. The most celebrated of all is at S'rî Nâth Dwâr, in Ajmeer; and the members themselves belong to the better and wealthier classes of the Hindu community. At present, there are about 60 or 70 'Mahârajas' of this sect dispersed over India; eight or ten of whom reside at Bombay alone, and fifteen or sixteen at Gokul. But so much degenerated are they as a body, that only two or three of them have any knowledge of Sanscrit; the rest, as a distinguished writer on this sect, Mr Karsandâs Mulji, asserts, being grossly ignorant; for, as Wilson remarks, it is a curious feature in the notions of this sect, that the veneration in which the Gosâins are held is paid solely to their descent, and unconnected with any idea of their sanctity and learning; and that, though they are not unfrequently destitute of all pretensions to individual respectability, they nevertheless enjoy the unlimited homage of their followers.

The chief authority of the sect is the *Bhâgavata Purân'a* (q. v.), and after it, the works of Vallabha and various books, 74 in number, 39 of which are translations from Sanscrit, and the rest original compositions in the Brijbhâshâ dialect. The object of their adoration is Vishn'u (q. v.) in his incarnation as Kr'ishn'a, whose residence is Goloka, far above the three worlds. There he originally lived alone, but in meditating on the works of creation, created a female form, which became the primary agent in creation: this was Mâyâ. He then produced crude matter, the five elements, and all the divine beings; the gods of the Trimûrti, their female consorts, and 300 millions of Gopîs, or cowherdesses, who are the especial attendants on Kr'ishn'a. The principles of the sect, as laid down by Vallabha, are the following ten—1. To secure the firm support of Vallabhâchârya; 2. To exercise chiefly the worship of Kr'ishn'a; 3. To forsake the sense of Vaidik opinion, and be a suppliant to Kr'ishn'a; 4. To sing praises with feelings of humility; 5. To believe that Vallabha is a Gopî, or mistress of Kr'ishn'a; 6. To swell the heart with the name of Kr'ishn'a; 7. To forsake his commands not for a moment; 8. To put faith in his words and doings; 9. To adopt the society of the good, knowing them divine; and, 10. To see not the faults, but speak the truth. Out of this code, however, grew up the doctrine, that the Guru or Mahârâj is the impersonation of Kr'ishn'a himself, that God and the Guru are necessarily to be worshipped, and that the sectary is bound to bestow on him 'his body, organs of sense, life, heart, and other faculties, and wife, house, family, property, with his own self.' The gross abuse which was made of this tenet became apparent in a very remarkable trial, the so-called Mahârâj Libel Case, which took place in 1861 in the Supreme Court of Bombay, and revealed the licentiousness of one of the then Mahârâjas of the sect at Bombay; the defendant sued for libel by this Mahârâj being a highly respected and distinguished member of the sect, Mr Karsandâs Mulji, who had had the courage of calling, in a native newspaper, on the Mahârâjas to reform, and to return to the ancient Hindu faith, and whose public conduct on that occasion elicited the highest praise of the court, and, it is to be hoped, initiated a better era of this sect. The temples of the sect have images of Kr'ishn'a, and Râdhâ, his principal wife, the former representing a chubby boy, of a dark hue, who is richly decorated, and eight times a day receives the homage of his worshippers. The ceremonials

which on those occasions take place are the *mangala*, or morning levee, about half an hour after sunrise, when the image is washed and dressed, and presented with refreshments; the *s'ringâra*, when the image, having been anointed and perfumed, holds his public court—this takes place about an hour and a half after the preceding; the *gwâla*, 48 minutes after the last, the image being now visited preparatory to its going out; the *râjabhoga*, held at mid-day, when Kr'ishn'a is supposed to have come home from the pastures and sat down to dine—all sorts of delicacies are then placed before the image, and distributed to the votaries present; the *utthâpana*, three hours before sunset, when the god is summoned to get up from his siesta; the *bhoga*, or afternoon meal, about half an hour later; the *sandhyâ*, about sunset, or the evening toilet of the image; and the *s'ayana*, or retiring to repose, about seven in the evening; the image then being put upon a bed, and refreshments being placed near it, when the votaries retire, and the temple is shut till the ensuing morning. Besides these ceremonies, there are other annual festivals observed by this sect throughout India; of these, the *Rath Yâtra*, or procession of the god in a chair, is the most celebrated in Bengal and Orissa; the most popular at Benares is the *Janmâshtamî*, or the nativity of Kr'ishn'a; and the *Râs Yâtra*, or annual commemoration of the dance of Kr'ishn'a with 16 Gopîs—a very popular festival, at which all kind of rejoicings take place. The mark on the forehead of the Vallabhâchâryas consists of two perpendicular lines meeting in a semicircle at the root of the nose, and having a round spot of red between them. On the breasts and arms, they have the same marks as the Râmânujas, made with a black earth called *S'yâmabandî*, or any black metallic substance; their necklace and rosary are made of the stalk of the Tulasî (holy basil) plant.—For a fuller account of this sect, its authorities, festivals, and worship, and the practices of the Mahârâjas, see the interesting *History of the Sect of Mahârâjas or Vallâbhâchâryas in Western India* (by Karsandâs Mulji—London, 1865), which also contains the history of the 'Mahârâj Libel Case' above referred to.

5. The *Mâdhwâchâryas*, or *Brahma Sampradâyins*. This sect occurs especially in the peninsula, and was founded by a Brahman, *Mâdhwâchârya*, who is looked upon by his followers as an incarnation of Vâyu, the god of wind, after having been incarnate in preceding ages as Hânumat (q. v.) and Bhîma. He was born in the year 1199, and educated in a convent at Anantes'war. In his ninth year, he was initiated into the order of Anchorites by Achyuta Pracha, a descendant of Sanaka, a son of Brahman. At that early age he composed a commentary on the Gîtâ; then travelled to the Himâlaya, and when returned, erected at Udipi the image of Kr'ishn'a, which had been originally made by Arjuna, and miraculously recovered by him. In addition to the principal temple at Udipi, he established eight other temples in Tuluva, below the Ghâts; composed, it is related, 37 works, and on a controversial tour, triumphed over various divines. In his 79th year he went to Badarikâs'rama, where, the legend says, he continues to reside with Vyâsa, the compiler of the Vedas and Purân'as. It seems that he was originally a priest of the S'aiva faith, and one of his names, *Ananda Tîrtha*, even indicates that he belonged to the class of Das'namî Gosâins, who were instituted by *S'ankarâchârya* (q. v.). He encouraged, therefore, an attempt to form a kind of compromise between the S'aivas and Vaishn'avas; and in the temples of his sect, images of S'iva are allowed to partake of the worship offered to those of Vishn'u. Votaries of the Mâdhwa Gurus and of S'ankarâchârya Gosâins offer also the reverential obeisance to their teachers mutually, and the latter visit the temple of the former to perform their adoration at the shrine of Kr'ishn'a. The essential dogma of this sect is the identification of Vishn'u with the Supreme Soul, as the pre-existent cause of the universe; and this primeval Vishn'u they affirm to be endowed with real attributes, and although indefinable, to be most excellent and independent. But besides this independent, there is also a dependent, principle; for besides the supreme soul, *Paramâtman*, there is a living soul, *Jîvâtman*, which is dependent on the Supreme; and though indissolubly connected with, yet not the same with him. In consequence, they deny the absorption of the human soul into the universal spirit, and the loss of independent existence after death. In this respect, they differ, therefore, on a vital point of doctrine, from the members of other Vaishn'ava and S'aiva sects. The manner in which they conceive the universe to have issued from the Supreme Being, is to a great extent analogous to that of the other Vaishn'avas; and they also receive the legends of the Vaishn'ava Purân'as relating to the birth of Brahman, from the lotus, which grew out of the navel of Vishn'u, &c. The modes of worshipping Vishn'u they declare to be three: marking the body with his symbols, especially by means of a hot iron; giving his names to children and objects of interest; and the practice of virtue in word, act, and thought. That in word consists in telling the truth, giving good counsel, mild speaking, and study; that in act comprises liberality, kindness, and protection; and clemency, freedom from envy, and faith, are the practice of virtue in thought. Final liberation, or freedom from future birth, they consider as the reward for having secured the favour of Vishn'u by sedulously worshipping him; and those who have attained it, enjoy felicity in Vishn'u's heaven, under one or all of the four conditions: of being similar to him in form, of remaining in his visible presence or in his proximity, and of sharing equal power with him.

Their worship is not materially different from that of the other V., except in one peculiarity, which proves that they have a friendly leaning towards the S'aiva sect; for the images of S'iva, Durgâ, and Gan'es'a are placed by them in the same shrine as Vishn'u. The Gurus, or superiors, of this sect are Brahmans and ascetics, or profess cœnobitic observances; the disciples live in their *Maths*, or monasteries, and profess also perpetual celibacy. The lay votaries of these teachers are members of every class of society except the lowest. The Gurus adopt the external appearance of ascetics, laying aside the Brahmanical cord, carrying a staff and water-pot, going bareheaded, and wearing a single wrapper of an orange colour. The marks common to them and the lay votaries are the symbols of Vishn'u upon shoulders and breast, and the frontal mark, consisting of two perpendicular lines made with the white clay *Gopîchandana*, and joined at the root of the nose, like that of the Râmânujas; but instead of a red line down the centre, they make a straight black line with the charcoal from incense offered to Nârâyan'a, terminating in a round mark made with turmeric. The scriptural authorities of this sect are, besides the writings of its founder, the four *Vedas*, the *Mahâbhârata*, the *Panchârâtra*, and the original *Râmâyan'a*.

6. The *Vaishn'avas of Bengal*, the far greater number of worshippers of Vishn'u, in Bengal, form one-fifth, or, according to another estimate, nearly one-third of the population of this province. Their founder, *Chaitanya*, was the son of a Brahman settled at Nadîya, but originally from Silhet. He was born in 1485, and his birth was accompanied by

the usual portentous indications, described in Hindu legends, of a superhuman event. He was, in fact, an incarnation of Kr'ishn'a, who appeared for the purpose of instructing mankind in the true mode of worshipping him in this age. Up to his 24th year, Chaitanya seems to have lived without any great pretensions to sanctity; he married, it is said, a daughter of Vallabhâchârya, and supported his mother after the death of his father, which occurred in his childhood. At twenty-four, however, he shook off the obligations of society, and became an ascetic, travelled between Mathurâ and Jagannâth, and taught his doctrine. At the end of his peregrinations, he nominated his two principal disciples, *Adwaitânand* and *Nityânand*, to preside over the V. of Bengal, and *Rûpa* and *Sanâtana* over those of Mathurâ. Chaitanya himself then settled at Cuttack, where he remained twelve years, engaged in teaching and controversy, and in intent meditation on Kr'ishn'a. There he had frequent visions of Kr'ishna, Râdhâ, and the Gopîs, and, in one of these fits of ecstasy, was nearly drowned in the Jumna. Ultimately, he disappeared—how, is not known—about 1527. Of his two chief disciples, *Adwaitânand* resided at S'ântipur, and seems to have been a man of some property and respectability. *Nityânand* was a resident of Nadîya, and a householder, and his descendants are still in existence. Besides these three Prabhus, or chiefs, the V. of Bengal acknowledge six Gosâins as their original teachers, viz., *Rûpa*, *Sanâtan*, *Jîva*, *Raghunâth Bhat't'*, *Raghunâth Dâs*, and *Gopâl Dâs*; and next to them they hold in veneration *S'rînivâs*, *Gadâdhar Pan"dit*, *S'rî Svarûpa*, *Râmânand*, and others, including *Haridâs*, who especially obtained almost equal honour with his master Chaitanya. In addition to these chiefs, the sect claims eight eminent poets, amongst whom *Krishna Dâs* is the most celebrated. According to the doctrine of the sect, *Kr'ishn'a* is the Supreme Spirit, who, for various purposes, assumed specific shapes, in which he became incarnate (see VISHN'U); and so far there is not much real difference between the tenets of this and other Vaishn'ava sects. But an important innovation, introduced by its founder, is the doctrine of *Bhakti*, or faith, which, he teaches, is infinitely more efficacious than abstraction, than knowledge of the divine nature—as enjoined by the philosophical systems—than the subjugation of the passions, than the practice of the Yoga, than charity, virtue, or anything deemed most meritorious. A consequence resulting from this doctrine is, that all castes become by such faith equally pure, and therefore that all castes are admissible into the sect; that all are at liberty to sink their social differences in the condition of ascetics, in which character they may live with each other without regard to former distinctions, and that all members of the sect are equally entitled to the food which has been previously presented to the deity. The *Bhakti*, or faith, comprehends five stages: quietism, as that of sages; servitude, which every votary takes upon himself; friendship for the deity, such as is felt by Bhîma and others honoured with his acquaintance; tender affection for the deity, of the same nature as love of parents for their children; and the highest degree of affection, such passionate attachment as the Gopîs felt for their beloved Kr'ishn'a.

The manner of expressing these feelings in acts of divine worship is about the same as that represented by the ceremonial of the Vallabhâchâryas; but the secular worshippers are generally content with paying their homage twice a day to the idol of Kr'ishn'a. Their chief ritual is a very simple one; it consists of constantly repeating the name of Kr'ishn'a—a practice of which one of their chiefs, Haridâs, set them a remarkable example, as during many years, when he resided in a thicket, he repeated the name of Kr'ishn'a 300,000 times daily. Their other duties are sixty-four, including many moral and many absurd observances, as suppressing anger, avarice, and lust, and singing and dancing in honour of Kr'ishn'a, and fasting every eleventh day. The most important of all their obligations, however, is their servile veneration of the spiritual teacher, whom they are bound to look upon as the deity himself, and even as possessed of more authority; for they are taught that 'the prayer is manifest in the Guru, and the Guru is Vishn'u himself;' again: 'First, the Guru is to be worshipped, then I (Vishn'u) am to be worshipped;' and, 'When Vishn'u is in anger, the Guru is our protector; but when the Guru is in anger, we have none.' In this respect, the doctrine of the V. of Bengal is similar to that of the Vallabhâchâryas, and their practice also agrees in so far as the V. look upon the dignity of their Gurus as hereditary, and not depending on personal capacity or sanctity; but, as in the case of the Vallabhâchâryas, this practice does not appear to have been enjoined by their original teachers. Liberation from terrestrial existence, most votaries of this sect do not conceive in the spirit of the Vedânta, which teaches that final deliverance is the absorption of the human soul into the divine essence; but, in their opinion, it is twofold, either perpetual residence of the soul in Swarga, or paradise, with possession of the divine attributes of power, &c.; or elevation to *Vaikun't'ha*, the heaven of Vishn'u, where they enjoy felicity under one or all of the four conditions, under which also the Madhwâchâryas conceive such felicity to exist. Chaitanya and his two chief disciples did not leave, as it seems, written compositions; the rest of his pupils, however, wrote numerous works in Sanscrit and Bengali. The V. of this sect are distinguished by two white perpendicular streaks of sandal, or *Gopîchandana*, down the forehead, uniting at the root of the nose, and continuing to near the tip; by the names of *Râdhâ-Kr'ishn'a* stamped on the temples, breast, and arms; by a close necklace of Tulasî stalk of three strings, and a rosary of 108 or sometimes 1000 beads made of the stem of the Tulasî. The sectaries consist of every caste and order, and are governed by the descendants of their Gosâins: some live in a state of celibacy; the teachers, however, are married men.

There are several divisions of this sect, arising from the various forms under which Vishn'u is worshipped; but besides them, there are three which may be looked upon as seceders from the original sect—viz., the *Spasht'a Dâyakas*, the *Kartâ Bhâjas*, and the *Sâhujas*.

The *Spasht'a Dâyakas* deny the divine character and authority of the Guru, and allow the association of male and female cœnobites in one conventional abode, where their relation is that of brothers and sisters, and their common interest the worship of Kr'ishn'a and Chaitanya. The women act also as the spiritual teachers of the females of respectable families, and the consequence is the growing diffusion of the doctrines of this sect in Calcutta, where it is especially established.—The *Kartâ Bhâjas* are of very recent origin, and, as they acknowledge the absolute divinity of the Guru, there would not be much difference between them and the original body of the V. of Bengal, had they not broken through the old line of hereditary teachers, and invested a new family with spiritual power—viz., that of their founder, *Râma-S'aran-Pâl*, who, at the beginning of this century, was successful in his attempt to create this schism.—Of the *Sâhujas*, very little is known, their professions and practices being kept secret.

These are suspected not to be of a very moral character. The chief temples of the V. of Bengal are at Dwarakâ, Brindâvan, Jagannâth, Nadîya, Ambika, and Agradwîpa.

Besides these Vaishn'ava sects, there are others of less importance, which it must here suffice merely to enumerate by name—viz., the sect of the *Khâkins*, founded by *Kîl*, the disciple of Krishn'adâs, and established chiefly at Hanumángád'hí, in Oude; the *Màlúk Dâsas*, founded by *Mâlúk Dâs* about 1600, or the end of the Emperor Akbar's reign—their principal establishment is at Kara Manikpur; the *Dâdû Panthis*, founded by *Dâdû*, a pupil of one of the Kabîr teachers, about the same time, and established especially in Marwar and Ajmeer; the *Rai Dâsas*, founded by *Rai Dâs*, a disciple of Râmânanda, a sect, it is said, confined to the very lowest of the mixed Hindu castes, or the workers in hides and leather; the *Senâ Panthis*, who derive their origin from *Senâ*, the barber, the third of Râmânanda's disciples; the *Mîrâ Bâis*, a subdivision of the Vallabhâchâryas, established by *Mîrâ Bâî*, the daughter of a petty Râjâ of Mertâ, and the wife of the Rân'a of Udayapur; the *Sanakâdi Sampradâyins*, or *Nîmâvats*, throughout Upper India, founded by an ascetic Nimbâditya; the *Râdhâ Vallabhis*, who consider Harivam's' as their founder, a personage who lived about 300 years ago, and established a monastery at Brindâvan; the *Sakhî Bhâvas*, probably owing their origin to the last-named sect; the *Charan' Dâsas*, whose chief seat is at Delhi, founded by *Charan' Dâs*, a merchant of the Dhûsar tribe, who resided at Delhi, in the reign of the second Alemgîr; the *Haris'chandis;* the *Sadhnâ Panthis*, founded by *Sadhnâ*, a butcher; and the *Mâdhavis*, founded by *Mâdho*.—For a fuller detail, see H. H. Wilson's *Sketch of the Religious Sects of the Hindus*, edited by Dr Rost in Wilson's Works, vol. i. (Lond. 1862); and on the Vallabhâchâryas, the *History of the Sect of the Mahârâjas* (by Karsandâs Mulji), mentioned above (Lond. 1865).

VALAIS (Ger. *Wallis*), a frontier canton of Switzerland, bounded on the N. by the cantons of Vaud and Bern, and on the S. by Italy. Area, 2016 sq. miles; pop. (1880) 100.216. It forms one long and deep valley, included between two of the loftiest mountain chains of Europe—the Pennine and the Bernese Alps—and is drained by the Upper Rhone, which, rising at its north-eastern extremity, in the glacier of the Gallenstock, falls at the western boundary of the canton into the Lake of Geneva. No European territory is more completely isolated by mountains; and it is rendered still more inaccessible by transverse chains, between which are enclosed narrow valleys. The greater part of the surface consists of barren mountain slopes; in their higher elevations, covered with the greatest of the Swiss glaciers. The forests and pasture-lands supply the inhabitants with their chief occupations. But grain-cultivation is not absent; the chief agricultural tract being the level ground, from a quarter of a mile to three miles wide, which lies along the main channel of the river. Here corn enough is grown to supply the wants of the inhabitants. The heat at the bottom of the valley is intense in summer, and Indian corn and the vine are grown with great success. The V. opens into the Lake of Geneva, and is connected by great high-roads, and now by railway, with the other parts of French Switzerland and Savoy. The Grimsel and Gemmi passes connect the eastern part of the valley with German Switzerland; and the Great St Bernard and Simplon (q. v.) passes connect it with Italy. Formerly, the cattle, the chief export of V., were driven over the Simplon into Italy, but now the railway, which ascends the valley as high as Sion, on the Simplon road, threatens to divert this trade to Western Switzerland and France. The inhabitants of the Upper V.—one-third of the population—speak German; those of the Lower V., the Vaudois dialect of French. The line which separates the two languages lies along the ridges running north from the Matterhorn to a point a little to the east of Leuk. All the inhabitants are Roman Catholic. The V. is subdivided into dixaines, each of which has its council, and may be said to form a republic. Each of the dixaines sends four members to a larger council or diet meeting at Sion. The upper part of the V., throughout the middle ages, acknowledged a very slight feudal dependence on the German Empire; the lower part belonged to Savoy. At the period of the struggle of the Swiss with the Duke of Burgundy, the Upper V. took possession of the Lower V., and reduced it to the position of a vassal state; and in this condition it remained until 1798, the period of French conquest, when the distinction was set aside. As stated in the article SWITZERLAND, under the recent constitution, the suffrage was extended to the whole pop. of V., with results little expected by the Liberal party in the Swiss diet. Sion (q. v.) and Martigny (q. v.) are the chief towns.

VALCKENAER, LUDVIG KASPAR, an eminent Dutch philologist, born at Leeuwarden, in 1715, studied at Franeker, and in 1741, became Professor of Greek there. Subsequently, he was called to Leyden, where he died, March 14, 1785. V. was an admirable lecturer and commentator on the classics. To a thorough knowledge of their literature and antiquities, he added a fine critical discernment and thoughtfulness. Among his more notable performances are his recasting of Ursinus's *Virgilius cum Scriptoribus Græcis Collatus* (Leeuwarden, 1747), his editions of the Greek grammarian Ammonius (Leyd. 1739; Leip. 1822), of the *Phœnissæ* (Franek. 1755; Leip. 1824), and the *Hippolytus* (Leyd. 1768; Leip. 1823), his *Diatribe in Euripidis Perditorum Dramatum Reliquias* (Leyd. 1767; Leip. 1824); his edition of the so-called *Epistles of Phalaris* (Gröning. 1777), and of the *Idylls* of Theocritus (Leyd. 1779—1781; new ed., Leip. 1810). He also furnished a rich store of critical observations to Wesseling's Herodotus. Among his posthumous works are his *Callimachi Elegiarum Fragmenta* (Leyd. 1799), his *De Aristobulo Judæo* (Leyd. 1806), and his *Opuscula Philologica, Critica, Oratoria* (2 vols. Leip. 1808).

VA'LDAI HILLS. See NOVGOROD.

VALDEPE'ÑAS, a town of New Castile, in the modern province of Ciudad Real, and 30 miles east-south-east of the city of that name. It is a straggling mud-built town, situated in a district celebrated for its red wine. The wine, when obtained pure, which it seldom is except at V., is rich, fruity, full-bodied, high-coloured, and will improve for ten years. Pop. 7400.

VALENCE, a town of France, capital of the dep. of Drome, in a charming situation on the flank of a hill that borders the left bank of the Rhone, 65 miles south of Lyon by railway. The walls with which it is surrounded give it a gloomy appearance. Silk-weaving and silk-throwing are carried on, manufactures of printed and other cottons, and commerce in silk, fruits, wines, liqueurs, and spirits. Pop. 22.500.

VALE'NCIA, a small island on the south-west coast of Ireland, forms part of the county Kerry, is separated from the mainland by a narrow arm of Valencia Bay, and lies 38 miles west-south-west from Killarney. It is 5½ miles long and 2

miles broad; the soil is in many places good; half the entire area is under cultivation; and there are about 2500 inhabitants. On the west side, which is mainly high rocky moorland, there are valuable slate and flag quarries. On the north side of the island is Valencia Bay, an inlet of Dingle Bay; and Valencia Harbour, the most western in Ireland, is part of the bay of the same name. Here is the telegraphic station for the two Atlantic cables, now in operation. See TELEGRAPH. Of these, the first made to work was a new cable, laid in the summer of 1866—the other, the cable which was lost in 1865, was recovered by grappling, September 1, 1866, and safely prolonged to Heart's Content in Newfoundland.

VALE'NCIA, a former kingdom of Spain, now subdivided into the three modern provinces of Valencia, Alicante, and Castellon de la Plana (see SPAIN), comprises a tract of country in the east of Spain, washed by the Mediterranean, and bounded on the N. by Catalonia, and on the S. and S.-W. by Murcia.

In the middle districts of the kingdom are small plains, abounding in lagoons where they border on the Mediterranean, but furnished with few harbours; both in the north and south are mountain ridges, offsets from the eastern edge of the great central plateau of Spain. V. is remarkable for its fine climate, and for its fertility in the well-watered districts. The fruitful localities called the *Huertas* (gardens) yield three, and sometimes four harvests in the year. Neither wheat nor barley is largely grown, but the rice-crops are so abundant, that not only is the whole of Spain supplied with this article from V., but a considerable quantity is also exported. The country is rich in iron, lead, copper, cinnabar, cobalt, and coals. The lagoons on the coast, especially that of Albufera, are rich in sea-fowl and fish. The inhabitants, in whom is observable a strong mixture of Moorish blood, are remarkably industrious, and V. is known to be the most actively manufacturing province of Spain after Cataluña.

VALENCIA, an ancient city and seaport of Spain, formerly capital of the kingdom, and now of the province of the same name, stands on the shores of the Mediterranean, 294 miles east-south-east of Madrid by railway. The Huerta—35 English sq. m. in extent—which surrounds the city resembles an immense orchard, and is ingeniously watered by an intricate network of pipes and rivulets, laid down by the Moors eight centuries ago, and efficiently answering its purpose down to the present day. In this garden, the carob, citron, orange, palm, and mulberry grow in wild luxuriance. Nature, stimulated by constant moisture and a burning sun, exhibits a wonderful strength and fecundity. V. is surrounded by old picturesque battlemented walls, erected by Pedro IV. in 1356; the interior of the city is striking and pleasing; most of the streets are macadamised; and while, in the old quarters, the houses are closely packed and gloomy-looking, well suited to keep out the enemy, *heat*—those recently erected are high, gaily-coloured in blue, rose, cream-colour, &c.; decorated with elegant iron-gilt balconies, and furnished with courts freshened with flowers and cooled by fountains. V. is the see of an archbishop, and its cathedral, La Seo—the see—which was commenced in 1262, is classical in the interior, and Gothic in the exterior, is 350 feet long, and at the transepts, 216 feet wide. From the top of a tower which surmounts one of the portals, the view is said to be one of the most striking in Spain. In the cathedral and its chapels there are a number of magnificent pictures, including some by Ribalta and Joanes. The Church of the Colegio de Corpus is quite a museum of pictures by Ribalta, who, according to Ford, has painted heads equal to any produced by the old Venetians. There are also numerous and interesting picture-galleries, in the chief of which only the productions of the great Valencian school are to be seen. The custom-house, dating from 1758, is now the Cigar Factory, which employs 3500 women, and produces 120,000 lbs. of tobacco yearly. The university, with a public library of 40,000 vols., is well attended. Silk-spinning and weaving are extensively carried on. There are also extensive hemp and cloth weaving, and manufactures of hats, glass, linen, leather, and Valencia tiles for flooring. V. was long sunk, like the whole of the country, in a lethargic sleep, but it has within recent years awakened to activity. Its port has been improved; it is now connected with Madrid by railway, and being to its own metropolis what Brighton is to London, it is much visited in summer by the *Madrilenos*, who contribute greatly to its prosperity. There is considerable commerce with Britain. Pop. about 90,000.

V., or *Valentia de Cid*, is a very ancient city. It was destroyed by Pompey, and rebuilt by Sertorius, after which it became a *colonia*. It was taken by the Goths in 413 A.D., and by the Moors in 712. The *Cid* took it in 1094—1095, and ruled despotically here till 1099. The union of Ferdinand and Isabella brought it under the Castilian crown.

VALENCIA, Venezuela. See SUPP. in Vol. X.

VALENCIENNES, a manufacturing town and fortress of France, in the dep. of Nord, on the Escaut, 155 miles by railway north-north-east of Paris. It is well built, but it does not contain many objects of attraction of any sort. There are many pleasant promenades in the immediate vicinity. A famous kind of lace is made here, as well as fine woven fabrics and gauzes. Salt-making and sugar-refining are carried on, and there is an active trade in timber, wine, and oil. It is the birthplace of Watteau and Froissart. Pop. 20,000.

VA'LENS, emperor of the East, the brother of Valentinian I. (q. v.), was born near Cibalis in Pannonia, about 328 A.D., and was associated with his brother in imperial authority, receiving as his share of the empire, Asia, Egypt, and Thrace, March 28, 364. His sovereignty was, however, disputed by Procopius, a supposed scion of the race of Constantine, who raised his standard in Thrace, was crowned at Constantinople, and for two years maintained his ground with skill and courage, till the defeat of his troops at Thyatira and Nacosia, and his subsequent capture and cruel death, 366 A.D. The first prominent act of V.'s reign was a reduction of 25 per cent. in the taxes, which gained him the general good-will of his subjects, but was of questionable prudence in the unsettled state of the northern and eastern frontiers. The prolonged imprisonment of 3000 Ostrogoths, who had been sent to aid Procopius, led to a rupture between V. and the aged hero Hermanric, and to a war which lasted from 367 to 369. The contest was carried on in the country of the Goths, and was throughout in favour of the Romans. Difficulties arose immediately afterwards (370) with the Persians, who were desirous of possessing themselves of Armenia, and though the two powers came frequently into collision, the one as the assailant, and the other as the ally of the Armenian monarch, war was not declared till the end of 372, when the Romans were victorious. V., who had removed to Antioch at the commencement of the war, now occupied himself with the religious quarrels

between the Arians and the orthodox party, which at that time raged with much violence over the whole eastern empire. Incapable of independent judgment, he had adopted the views of his Arian councillors, and under their guidance, punished the more obstinate of the 'heretics.' At the same time, a conspiracy, prompted by professors of magical arts, who declared that V.'s successor should be one whose name began with *Theod*, was discovered, its promoters and agents punished with death, as well as a number of persons who were so unfortunate as to possess a name commencing with the unlucky prefix. Affairs on the eastern frontier again assumed a threatening aspect; but the Romans were disinclined any longer to interfere with the designs of the Persians on Armenia, and concluded a somewhat discreditable treaty in 376. In the meantime, events were taking place on the northern frontier which were destined ere long to become of sinister import to the Roman Empire. The Goths, who had for some time been peacefully settled in Dacia, were assailed by the advancing hordes of the Huns; the Ostrogoths, who first felt the shock, were partly incorporated, and the remainder forced to retreat; the Visigoths next attempted to stem the torrent, but without success, and immense crowds of fugitives belonging to this warlike race crowded to the north bank of the Danube. V. accorded permission to a large body of Goths under Fritigern to cross into Mœsia and Thrace, and take possession of the waste lands in these provinces; the fugitive Ostrogoths soon afterwards crossed the river without permission; and the alarm which the numbers and turbulence of his new subjects speedily aroused, led V. to the adoption of such impolitic measures, that the gratitude of the Goths for shelter afforded was turned to bitter resentment. V., prompted by his servile and flattering advisers, at last resolved on war; and marching against the barbarians, he engaged them near Adrianople, August 9, 378. His army was totally routed, and two-thirds of it, including V. himself and most of his chief officers, left dead on the field.—See Gibbon's *Decline and Fall*, chaps. 25 and 26; and Tillemont's *Histoire des Empereurs*, vol. v.

VALENTINE, BASIL, a celebrated German alchemist, of whom so little is known that it has been disputed whether he flourished in the 12th or the 15th century. It has been maintained that he was a monk of the order of St Benedict, in St Peter's convent at Erfurt, but his name does not appear on the list at Erfurt, nor on the general list kept at Rome. It seems probable that he flourished about the end of the 15th century. He was a diligent seeker for the philosopher's stone, and wrote a large number of works, chiefly on the process of transmutation, a complete list of which will be seen in Lenglet's *History of the Hermetic Philosophy*, vol. iii. Some of the titles are curious, as *Basil Valentine's Twelve Keys of Philosophy*, *Apocalypsis Chymica*, *Revelation of the Mystery of the Essential Colours of the Seven Metals*, *The Triumphal Car of Antimony*, *A Chemico-philosophical Tract concerning Things Natural and Præternatural*, &c. After his death, his works were thought to be wholly lost, when they were discovered in the stonework of the abbey, 'Heaven itself conspiring to bring to light these extraordinary works by shattering by a thunderbolt the pillar in which they were concealed,' if we are to believe his followers in the mystic art, who have handed the story down to us. His works were mostly written in the old Upper-Saxon dialect, and were not printed till 1602; after which time many of them were published in the form of French translations, though a few still remain in MS.

VALENTINE'S DAY, the 14th of February, is, or more correctly was, celebrated in England, Scotland, and in different parts of the continent, particularly Lorraine and Maine in France, by a very peculiar and amusing custom. On the eve of St Valentine, a number of young folk—maids and bachelors—would assemble together, and inscribe upon little billets the names of an equal number of maids and bachelors of their acquaintance, throw the whole into a receptacle of some sort, and then draw them lottery-wise—care, of course, being taken that each should draw one of the opposite sex. The person thus drawn became one's valentine. Of course, besides having got a valentine for one's self, one became, by the universality of the practice, some other person's valentine; but, as Misson, a learned traveller in the early part of last century, remarks, 'the man stuck faster to the valentine that had fallen to him, than to her to whom he had fallen.' These imaginary engagements, as may readily be supposed, often led to real ones; because one necessary consequence of them was, that for a whole year, a bachelor remained bound to the service of his valentine, somewhat after the fashion of a medieval knight of romance to his lady-love. At one period, it was customary for both sexes to make each other presents, but latterly the obligation seems to have been restricted to young men. During the 15th c., this amusement was very popular among the upper classes, and at many European courts. From Pepys's *Diary*, we see that in Charles II.'s reign, married as well as single people could be chosen.

For some time back, the festival—at least in England and Scotland—has ceased to possess the graceful symbolic meaning it used to have, and has become a considerable nuisance. 'The approach of the day is now heralded by the appearance in the printsellers' shop-windows of vast numbers of missives calculated for use on this occasion, each generally consisting of a single sheet of post-paper, on the first page of which is seen some ridiculous-coloured caricature of the male or female figure, with a few burlesque verses below. More rarely, the print is of a sentimental kind, such as a view of Hymen's altar, with a pair undergoing initiation into wedded happiness before it, while Cupid flutters above, and hearts transfixed with his darts decorate the corners. Maid-servants and young fellows interchange such epistles with each other on the 14th of February, no doubt conceiving that the joke is amazingly good; and, generally, the newspapers do not fail to record that the London postmen delivered so many hundred thousand more letters on that day than they do in general.'—Chambers's *Book of Days*, vol. i. p. 255.

The connection of the custom with St Valentine is purely accidental. In the legends of the different saints of that name recorded in the *Acta Sanctorum*, no trace of the practice peculiar to the 14th of February is found. It has been suggested by Mr Douce, in his *Illustrations of Shakspeare*, that the custom may have descended to us from the ancient Romans, who, during the *Lupercalia*, celebrated in the month of February, were wont among other things 'to put the names of young women into a box, from which they were drawn by the men as chance directed;' and that the Christian clergy, finding it difficult or impossible to extirpate this pagan practice, gave it at least a religious aspect, by substituting the names of particular saints for those of the women; and it is certainly a usage more or less widely extended in the Roman Catholic Church to select, either on St Valentine's Day or some other, a patron saint for the year, who is termed a valentine. But it is

far more probable that the custom of choosing valentines is a relic of that nature-religion which was undoubtedly the primitive form of religion in North-western Europe—as elsewhere; and that it sprung from a recognition of the peculiarity of the season. Hence in Bailey's Dictionary the following explanation is given: 'About this time of the year the birds choose their mates, and probably thence came the custom of the young men and maidens choosing valentines or special loving friends on that day.'

VALENTI'NIANS, a Gnostic sect or school (see GNOSTICS), founded by Valentinus, who went from Alexandria to Rome about 140 A. D., and died there, or in Cyprus, about 160. The distinguishing feature of his system lies, in the first place, in his recognising heathenism as a preparatory stage of Christianity; and then in his dividing the higher spiritual world into 15 pair of æons, each consisting of a male and a female. The first pair, or syzygy, is made up of Bythos, or God in himself, and Ennoia, or God as existing in his own thoughts; from these emanated next Nous (Intelligence) and Aletheia (Truth), and so on. As the last æon, Sophia, transgressed the bounds that had been laid down by the æon Heros, and a part of her being became lost in Chaos, there was formed a crude being, called Achanroth, which, through the Demiurgos that emanated from it, created the corporeal world. Heros now imparted to the souls of men (for all the bodies composing the corporeal world are possessed of souls) a *pneumatic* or spiritual element, but this only attained to full activity when Christ, a collective emanation from all the æons, appeared as Saviour, and united himself with the man Jesus. In the end, all that is pneumatic, and even the originally psychic or soul element in as far as it has assimilated itself to the psychic, will return into the Pleroma.

VALENTINIA'NUS, the name of three Roman emperors of the same family; the first and most famous of whom, VALENTINIANUS I., was the son of Gratianus (a rope-maker who had enlisted in the army, and risen to the grade of *comes militum*), and was born at Cibalis, in Pannonia, 321 A.D. V. entered the army at an early age, and, aided by the military renown of his father, rapidly rose in rank under the emperors Constantius and Julian, only, however, to fall more rapidly; for he was degraded by Constantius in 357, and, for his publicly expressed contempt for paganism, banished by Julian in 362. Restored to favour in the following year, he distinguished himself in the East, and on the death of Jovian was unanimously chosen as his successor, February 26, 364. A month after his accession, he chose as his colleague his brother, Valens (q. v.), to whom he resigned the government of the East, reserving for himself Illyricum, Italy, the Gauls, Britain, Spain, and Africa. During V.'s reign the utmost vigilance was required to preserve the frontier districts of the empire from the ravages of the swarms of barbarians who, like vultures, had gathered round their prey, watching with greedy eagerness the rapid decay of its strength, and ready at the first opportunity to hasten its impending doom. The Alemanni repeatedly (366—368) ravaged the east, and the Saxons (370) the north-east of Gaul; Illyricum was wasted (370) by the Quadi, and Africa by the southern desert tribes; and though these invasions were mostly repelled and revenged in a manner becoming the warriors of the queen of nations, the auxiliary means often had recourse to (e. g., the assassination of two powerful and able opponents, the kings of the Alemanni and Quadi, and the treacherous attack on the Saxons while under the fancied security of a treaty), surely indicated that the sturdy virtue which formerly imbued the soldiers of the empire was rapidly disappearing. The internal administration was excellent, for the emperor added to his ability, prudence, and firmness of character, the less common imperial qualities of vigilance and impartiality; and his cognizance of any abuse or injustice by whomsoever perpetrated, was the signal for its speedy rectification, and the severe punishment of the offender. Though himself a zealous Catholic, he repelled the solicitations of the bishops who wished him to interfere in the religious disputes of the time, permitted his subjects to adopt whatever religion they chose, and strictly forbade all persecution or annoyance on account of religious belief, even maintaining the 'pontifices' of the provinces in the privileges which they had possessed under Julian. On account of the scandalous abuse by ecclesiastics of their influence over their penitents, he excluded priests and monks from the right of succession to property; judicial proceedings were forbidden to be held in private; the extreme licence of speech hitherto allowed to advocates was judiciously restrained; gratuitous medical attendance was provided for the poor of Rome; and schools were established throughout the empire. The success of V.'s administration was doubtless much owing to his fortunate choice of officers: Theodosius the Elder in Africa and Britain, Jovinus in Gaul, and Theodosius the Younger (afterwards emperor) in Illyricum, form a trio distinguished by an unswerving loyalty, administrative ability, and military talent, rarely found in any age; and contrast strongly with their predecessors in office. V.'s private life was a model of morality and economy, and according to the summation of the accurate and trustworthy Ammianus, 'he had so many good qualities, that if everything had been equal in him, he would have been another Trajan or Marcus Aurelius.' But the one and grievous fault which marred his character was an ungovernable temper, which led him into the occasional commission of excessive cruelties, and ultimately caused his death; for while giving audience to the deputies of the Quadi, with whom he was then at war, he worked himself into such an access of passion as to rupture a blood-vessel in his chest, and fell back dead into the arms of his guards, November 17, 375. By his first wife he had one son, Gratianus (q. v.); and by the second Justina, another son, Valentinian, and three daughters, one of whom, Galla, became the wife of the Emperor Theodosius I.—VALENTINIANUS II., the younger son of the preceding, was born 372 A. D., and received from his elder brother, Gratianus (q. v.), the provinces of Italy, Illyricum, and Africa, as his share of the Western Empire. During his long minority, the Empress Justina administered the government; and about three years after her death, V., who had given promise of good administrative qualities, was murdered by the Frank, Arbogastes, the commander-in-chief of his army, May 15, 392.—VALENTINIAN III., the grand-nephew of the preceding, being the son of Constantius III. by Placidia, the daughter of Theodosius the Great and Galla, was born about 419 A. D., and was seated on the throne of the West by Theodosius II., emperor of the East, 425 A. D. V. was a weak and contemptible prince, nevertheless his reign is one of the most interesting epochs of Roman history, exhibiting, as it does to the full, the internal weakness and corruption of the empire, the gradual closing with it of its irresistible barbarian foes; the sad picture being momentarily lightened from time to time with a flash of the warrior-spirit of old Rome. V. may be said never

to have ruled during the 30 years that he sat disesteemed and unhonoured on the imperial throne; his mother, Placidia, governed till her death in 450, and was succeeded by the eunuch, Heraclius, one of those malignant fribbles who swarmed around the throne of the falling empire. The regulations enacted for the internal administration were creditable, and especially so when ecclesiastical interests were involved. as in almost all cases, the ambitious and persecuting tendencies of the now preponderant orthodox party, were firmly restrained; while, on the other hand, the fierce vindictiveness of its more bigoted rivals was kept within bounds. But the utter corruption of manners, the complete extinction of 'public spirit,' the oppressive exactions of the tax collectors, and equally of the commissioners who were appointed to prevent these exactions; the general employment of the powers of the executive in the avenging of private quarrels, and the utter impossibility of obtaining redress for injuries, too plainly shewed that the empire had fallen far beyond remedy, and that if not destroyed by assailants from without, it would speedily crumble to pieces of itself. The early part of V.'s reign was disturbed by the contests between the 'comites' Boniface and Aëtius, the former of whom had supported, and the latter resisted V.'s claims to the throne; but notwithstanding this, the vile and groundless calumnies of Aëtius prevailed upon the empress to declare the gallant and upright governor of Africa a public enemy; and the latter, in the first flush of resentment, called to his aid the Vandals under Genseric (q. v.). Thus Africa was lost to the empire. But Aëtius, notwithstanding, proved himself the invincible bulwark of the Roman power in Europe; the Franks, Goths, Burgundians, and other German nations who had encroached on the empire, were successively defeated and repelled, and the destructive career of the formidable Huns brought nigh to a close on the field of Chalons. Yet the labour of defending an extensive empire from attack on all sides was too much for one man; and consequently, much of Spain and Gaul was ultimately seized by the Suevi and Visigoths, the north of Italy was ravaged by the Huns, Sicily and Sardinia by the Vandals, and even Rome repeatedly besieged, while Britain was abandoned to the wild Picts and Scots. Aëtius seems to have committed the same error as his more upright and noble, though not more able, predecessor Stilicho (q. v.), in attempting, by the marriage of his son to V.'s daughter, to transfer the imperial dignity to his own family, and like him also, undermined in influence and reputation by the machinations of a eunuch, he was assassinated, though by the sword of his master (454). In the following year, V., who had ravished the wife of his intimate friend Maximus, was conspired against by the friends of the latter, and the faithful adherents of Aëtius, and murdered in the midst of his guards, March 16, 455.

VALE'NZA (*Valentia Valentinum Forum*), a city of Northern Italy, on an elevated plain, on the right bank of the Po, eight miles north of Alessandria. It is very regularly built, and commands a fine view of the surrounding vine-clad hills. It carries on a trade in wine, and manufactures of silk, flax, and hemp fabrics. Pop. 9612.

V., a very ancient town, belonged to the Liguri, and was conquered by Marcus Fulvius, the proconsul, who named it *Forum Fulvii, quod Valentinum*. In 1635, it was besieged for 50 days by the armies of France, Savoy, and Parma, and taken. In 1707, it came into the possession of Victor Amadeus II., Duke of Savoy; in 1805, the French destroyed its gates and fortifications; and in 1815, after the fall of Napoleon's empire, it reverted to the king of Sardinia.

VALE'RIAN (*Valeriana*), a genus of plants of the natural order *Valerianaceæ*, an order of exogenous plants, containing nearly 200 known species, natives of temperate climates, chiefly of Europe, the mountainous parts of India, and South America; annual or perennial herbaceous plants with opposite leaves, destitute of stipules, and small flowers in cymes. They are nearly allied to *Dipsacaceæ* (see TEASEL), but differ in the mode of inflorescence, and in the seeds being destitute of albumen. The fruit also is not simply 1-celled, but exhibits two other abortive cells, and the stamens are 1—5, the stigmas 1—3. The corolla is sometimes spurred.—The genus *Valeriana* is distinguished by a pappus-like calyx, a spurless corolla, and three stamens. The species are pretty numerous. The common V. (*V. officinalis*) is abundant in ditches, moist woods, &c. in Britain and throughout Europe. It has a fleshy root, pinnatifid leaves, a stem 2—4 feet high, and pale flesh-coloured flowers. The root is a well-known medicine, used both by physicians and as a domestic remedy in spasms, epilepsy, hysteria, and other nervous affections. It possesses powerful antispasmodic properties, and a very considerable influence over the nervous system. Cats are very fond of it, and it exercises a remarkable stimulating and intoxicating power over them.

Valeriana officinalis.

Although the plant grows chiefly in damp soils, the root is most powerfully medicinal in dry hilly ground.

The roots should be collected in autumn; and those from wild plants growing on a dry soil are preferred. The chief ingredients of valerian are woody fibre, resinous and gum-like matters, and a little more than 1 per cent. of a volatile oil, which is crystallisable, and has been termed *valerole*, and in which a well-known acid (also obtained from several other sources), *valerianic* or *valeric acid*, is developed on exposure to the air. Valerian imparts its therapeutic properties, which are those of a stimulating antispasmodic agent, both to water and to alcohol. There are three officinal preparations—viz., the *Infusion*, the *Tincture*, and the *Ammoniated Tincture*. In large doses, valerian produces considerable disturbance of the nervous system, as headache, vertigo, and even temporary blindness. In average doses—as, for example, in from one to two ounces of infusion, and from half a drachm to two drachms of either of the tinctures—it is a very efficacious remedy in those severe cases of hysteria which closely simulate epilepsy, and in chorea. As some of the salts of valerianic acid—viz., the valerianates of soda, zinc, ammonia, iron, and quinine—act similarly to and with more certainty than the above-named preparations, we may infer that the therapeutic action of the remedy is solely due to the acid; and as the infusion and tinctures are by no means agreeable medicines.

they will probably soon be replaced by the valerianates.

The SMALL MARSH V. (*V. dioica*), also a native of Britain, is much less powerful than the common species.—The greater V. (*V. Phu*), which grows in alpine districts of the continent of Europe, is now almost entirely disused, although it is said to be one of the strongest of the European Valerians, a pre-eminence which *V. Dioscoridis* disputes with it.—*V. Celtica* and *V. Saluinca* are gathered near the limits of perpetual snow on the mountains of Styria and Carinthia, and carried into Turkey and Egypt, and thence into India and Ethiopia, to be used to aromatise baths, and as a substitute for SPIKENARD (q. v.).—*V. Sitchensis*, a native of the north-west of America, is said to possess the medicinal properties of the genus in great perfection. *V. Hardwickii* is used medicinally in Nepaul.—The root of *V. edulis*, a species found in the north-west of America, is an article of food of the Indians.—Corn Salad (q. v.) or Lamb's Lettuce belongs to the order *Valerianaceæ*.

VALERIANE'LLA. See CORN SALAD.

VALERIA'NIC or **VALERIC ACID** is one of the volatile fatty acids represented by the general formula $C_nH_{2n}O_2$. The composition of valeric acid is represented by the formula $C_5H_{10}O_2$; and amongst its chief properties it may be noticed that it is a limpid, colourless, oily fluid, of a penetrating odour, allied to that of valerian root, and an acrid taste. It renders paper transparent, but the spots disappear on exposure to the air. Its specific gravity is 0·94, it boils at 347°, and may be distilled without change; and its vapour is inflammable. It is only slightly soluble in water, but dissolves in alcohol and ether in all proportions. It exists in and is obtained by distilling valerian root with water acidulated with sulphuric acid. It may be similarly obtained from angelica root, and some other vegetable sources. It is also formed during the oxidation of fats and fatty acids (especially oleic acid), either by nitric acid or mere exposure to the air, by the oxidation and putrefaction of the albuminates, &c.; but the best method of procuring it is by distilling a mixture of amylic alcohol (or fousel oil) with bichromate of potash and sulphuric acid.

The salts of valerianic acid—the valerianates or valerates, as it is now becoming the fashion to call them—are formed either by saturating the base or its carbonate with the free acid, or by double decomposition, their general formula being $MC_5H_{10}O_2$, when M is any metal. The alkaline valerianates are very soluble, and are not easily obtained in crystals; but most of the other salts occur in nacreous scales, and all of them, when moist, have the smell and taste of valerian.

The following salts are used in medicine: *Valerianate of sodium*, which is included in *Pharm. Br.*, and *Valerianate of zinc*, which is also included in *Pharm. Br.* and occurs in brilliant white pearly tabular crystals, with a feeble odour of valerianic acid and a metallic taste, is scarcely soluble in cold water or in ether, and insoluble in hot water and alcohol. Besides these officinal salts, the valerianates of ammonium, of iron, and of quinine are employed in the same cases as the preparations of valerian, the doses averaging from half a grain to three or four times that amount three times a day in pills, except in the case of the ammonia salt, which is best given in solution. *Valerianate of oxide of amyl* ($C_5H_{11},C_5H_{10}O_2$) is a volatile fluid with a penetrating odour of apples, boiling at about 360°, slightly soluble in water, but dissolving freely in spirit and in ether. In the form of a dilute spirituous solution, it so strongly resembles apples in its smell, that it is used in perfumery under the title of *oil of apples*.

VALERIA'NUS, P. LICINIUS, Roman emperor, was descended from an ancient and noble family, and after distinguishing himself in the various posts which he was selected to fill by masters who appreciated his talents and virtues, was chosen for his integrity and accomplishments to the office of censor. Faithful in his allegiance to Gallus, he went to summon the legions of Gaul and Germany to aid the feeble emperor against the usurper Æmilianus, but arrived too late to save his master. The usurper's troops, awed by the superior numbers of V.'s army, and the stern sanctity of their leader's character, murdered their own chief, and united with their late antagonists in proclaiming V. emperor, 253 A.D. V. was then about 60 years of age, and feeling his inability to sustain, unaided, the cares of empire, assumed as colleague his eldest son, Gallienus (q. v.). V. shewed abundant proof during his short reign of most ardent zeal for the prosperity of the empire; but the times required a ruler of more energy and ability; as the grave disturbances which arose throughout the empire, the irresistible irruption of the Franks into Gaul, despite the utmost efforts of Aurelian (q. v.), the devastation of Thrace, Macedonia, Greece, and the Archipelago by the Goths, the advance of the Alemanni to Milan, and the conquest of Syria and Armenia by Shapur, amply testified. The troubles in the East appearing most threatening, V. went thither in person, and for some time fortune favoured his standard; but pursuing his opponents too rashly, he was suddenly attacked by superior numbers at Edessa, completely defeated, and himself, with the remnant of his army, forced to surrender, 260 A.D. The statements regarding the indignities heaped upon the unfortunate captive by his haughty conqueror, are probably false, or, at least, much exaggerated; but of one thing we are assured, that V. languished till death in hopeless captivity; and after his death, his skin was flayed off, stuffed, preserved as a proud trophy of victory, which was invariably exhibited to the ambassadors from Rome to the Sassanide court.

VALE'TTA, an important fortress and beautiful city, capital of the island of Malta, on the north-east side of which, in lat. 35° 53′, long. 14° 31′, it is situated. It occupies a tongue of land, which runs out in a north-east direction, is 3200 yards long, and generally about 1200 yards across, except at the extremity, where it narrows considerably, and forms the famous Point of St Elmo, on which are a powerful fort and a light-house. From this Point to its landward end, the neck of land, which is well named the 'Hog's Back,' rises gradually; and there is a downward slope from the central ridge to the Great Harbour on the right, and to the Marsa-Musceit, the quarantine harbour, on the left. Eight principal streets traverse the peninsula, and are intersected by cross-streets, that pass over the central ridge, and afford communication from harbour to harbour. These cross-streets are necessarily very steep at the extremities, where they rise from the shores by long flights of stairs. The town and harbours are defended by a series of fortifications of great strength. They are mostly hewn out of the solid rock, and, mounted with the most powerful artillery, are considered impregnable. The city is divided into five quarters—the *Citta Nuovo*, or Valetta Proper, Floriana, Vittoriosa, Sanglea, and Barmola. Besides the enormous forts, balconies, and battlements, which are the principal architectural characteristics of the city, V. contains

many noble edifices. The governor's palace—formerly that of the Grand Masters—is unadorned without, but magnificent within, and possesses an interesting armoury; the 'con-' (i. e., joint) cathedral of St John is a superb structure; and the church of San Pubblio, with its famed *sotteraneo* (vault) of embalmed monks and skeletons; the public library, 60,000 vols.; the university; and the aqueduct, which brings water to the city from the far side of the island, a distance of 8¾ miles, are worthy of notice. The city was founded by the Grand Master Valette—from whom it derives its name—in 1566. V. is the centre of the commerce of the island, for which, as well as for the principal historical incidents with which its name is associated, see MALTA. Pop. upwards of 60,000.

VALETTE, JOHN PARISOT DE LA, a Grand Master of the Knights of St John, celebrated for his gallant defence of Malta against a powerful fleet of the Turks, which must be regarded as mainly instrumental in checking the westward progress of the arms of Solyman the Great, long the terror of Europe and of Christendom. La V. was born of a noble family, in 1494; and at a very early age entered the order of St John, in which he soon distinguished himself by his enthusiastic bravery and his skill in arms. His chief distinctions, even in youth, were won in the naval service in the Mediterranean, where the Turkish power was especially formidable. On the death of Claude la Sangle, Grand Master of the order, La V. was elected to that office, being the 48th in the list of the grand masters. Still directing the energies of the order in the same course, he succeeded, within the first five years of his Grand-mastership, in capturing 50 great galleys from the Turks, and an immense number of smaller vessels of war; a success which so stirred the indignation of the sultan, that he resolved on the capture of Malta, and the destruction of the Knights. Accordingly, on the 18th May 1565, an immense fleet, of 159 ships, conveying a body of 30,000 janizaries and spahis, appeared off the harbour of Malta, and after failing in several assaults, formally invested the island. Alone and unsupported by any of the Christian powers, the gallant La V. maintained the fortress under circumstances of extreme difficulty and distress of every kind; and when, all further resistance seeming to be hopeless, he was urged to capitulate, his reply was, that the life of a worn-out soldier of 71 years could not be better spent than in such a service. At last, at the end of four months, and after a loss, it is said, of 20,000 men, the Turkish fleet was forced to raise the blockade and withdraw from the island. La V. died three years later, August 21, 1568.—There is another LA VALETTE, a father of the Jesuit Society, who obtained a very different sort of notoriety in the latter half of the 18th century. Having engaged, contrary to the prohibition of Benedict XIV., as a trader in the products of the large estates held by the Jesuits in the Philippine Islands, and being unable, in consequence of the capture of his ships by an English privateer, to meet his engagements, a suit was commenced in the French courts against the French province of the Society, the proceedings in which suit were among the causes which precipitated the expulsion of the Society from France, and its eventual suppression by Clement XIV. See JESUITS.

VA'LGUS is a term employed in Surgery to designate a variety of Club-foot (q. v.). The corresponding Latin word signifies 'having legs bent outwards, bow-legged,' and is probably derived from *volvo*, 'to turn or twist.' As it is an adjective, the substantive, *Talipes* (an unclassical word, indicating 'weakness of the feet,' but in surgical nomenclature signifying 'club-foot') must be regarded as understood.

VALLA, LAURENTIUS, one of the first scholars of the Renaissance, was born at Rome in 1415, taught classics in various places in the north of Italy; but in 1443, on account of his assaults on the scholastic philosophy, and his defence of Epicurus, found it advisable to seek protection at Naples from Alfonso V. Here, however, he soon fell under a suspicion of heresy, and was, it is said, dragged for punishment before the Inquisition. Aided by the king, he made his escape, and fled to Rome, where Pope Nicholas V. pardoned him, received him into favour, and appointed him papal secretary and canon in the church of St John Lateran. He died 1465. V.'s Latin translations of Herodotus (Par. 1510) and Thucydides (Lyon, 1543) are admirable, and had a great influence in spreading a knowledge of classic history; but the work that brought him most renown was the *Elegantiæ Latini Sermonis* (6 books; Rome, 1471), which long served as a model in style to Latinists. From 1471 to 1536, no fewer than 59 editions of it appeared. It has passages of noble eloquence in praise of the glorious tongue of Rome, through which one discerns a passionate desire for the unity of Italy—ever an honourable characteristic of Italian scholars and writers. The *Elegantiæ* is, moreover, full of nice grammatical observations, particularly on synonyms. V. has also the credit of being the first of the Renaissance scholars that used his classical culture in the criticism of the New Testament (*Annotationes in Novum Testamentum*, published by Erasmus). In his *De Donatione Constantini Magni*, he demonstrated the historical groundlessness of the pretended 'Donation' of Constantine, and inveighed against the popes for their grasping after temporal power; but this he was forced to retract. A collected edition of V.'s works appeared at Basel in 1543.

VALLABHA AND VALLABHÂCHÂRYAS. See under VAISHN'AVAS.

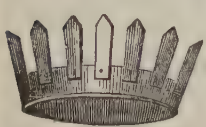
VALLADOLI'D, a famous city of Spain, sometime capital of the whole country, and still capital of the province of the same name (see CASTILE), stands on a wide, wind-blown plain on the left bank of the Pisuerga, 150 miles north-west of Madrid by railway. It is 2100 feet above sea-level, and has a healthy climate, the air being pure and genial, and the sky generally cloudless. Having been the residence of the court prior to its removal to Madrid at the close of the 16th c., the city contains many large and decayed dwellings; although, with the returning prosperity of the town, new mansions are being erected, and the streets are being paved, enlarged, and multiplied. In the Plaza de Campo, the site of famous tournaments, *autos-da-fé*, decapitations, and bull-fights, Napoleon reviewed 35,000 troops. The Plaza de Toros, or bull-arena, can accommodate 10,000 persons. The Museo, which contains such of the statues, carvings, and sculptures as could be collected at the suppression of convents in the province, is an elegant building, containing a grand saloon, six rooms filled with pictures, and three with sculptures. Of these treasures, the sculptures are the most valuable, though among the pictures are several by Rubens. Near the Palacio Real (royal palace), are the remains of two of the noblest Gothic religious edifices in the world, the convent of San Pablo and the Colegio de San Gregorio, both richly and beautifully decorated, but much damaged by the French soldiery. V. is admirably situated for trade and manufactures. There is abundant water for irrigation, and the

surrounding district is remarkably fertile. It communicates with the Atlantic by the Douro, and with the middle and south of Spain by canals and railways. Manufactures are springing up in the city; the soil in the vicinity is being improved by companies instituted for that purpose; and in other respects, V. gives tokens of revival. Silk, cotton, and woollen stuffs; jewellery, hats, paper, perfumery, &c., are manufactured. Pop. about 45,000.

V., the *Pincia* of Ptolemy, is first mentioned under its present name in 1072. Charles V. erected many splendid edifices here; and his son, Philip II., born here, gave his native town the title of city in 1596. About this time, V. was the most prosperous city in Spain—contained 100,000 inhabitants; was the usual resort of foreign princes, and of the great artists Berruguete, Juni Herrera, &c.; and boasted a university. In 1560, Madrid was declared the only court; and from this time the prosperity of V. declined.

VALLADOLI'D, a town of Mexico, in the state of Yucatan, 90 miles east-south-east of Merida, stands in the midst of a highly cultivated tract of country. It is the best constructed and the healthiest town in Yucatan, and the seat of cotton manufactures. Pop. 15,000.

VA'LLARY CROWN (Lat. *corona vallaris* or *castrensis*), a crown bestowed by the ancient Romans as an honorary reward on the soldier who first surmounted the outworks, and broke into the enemy's camp. It is in form a circle of gold with palisades attached, as in the above figure. The crown vallary occasionally occurs as a heraldic bearing.



Vallary Crown.

VALLEY, a hollow tract on the earth's surface between hills or mountains. Valleys are generally parallel to the direction of the ridges of elevated ground; but some are transverse, cutting through the mountain-chain. They have a watercourse at or near their lowest level. The main valley is that which has the river of the drainage-system to which it belongs flowing through it, while the tributary streams which feed this river flow through lateral valleys. The terms upper and lower valley define parts of the same valley, as related to the source or to the mouth of the river which flows through it. In a narrow valley, the river always occupies the lowest part; but in wide valleys, especially in those in which waters run that are largely charged with sediment, the river often builds up a channel for itself, that is higher than the ground at the foot of the hill. The river, in its floods, bears a large amount of mud, which it continues to carry as long as the water is retained within its bed; but whenever it overflows its banks, the velocity is reduced, and the heavier particles, which form the bulk of the sediment, are deposited near the river's course; while, flowing over the surface of the level ground, even the finer particles fall to the bottom, until, as it reaches the limits of the valley, the water gradually becomes clearer. The Rhine, the Nile, and indeed almost all great rivers in wide valleys, illustrate this phenomenon. The river seldom flows through the middle of the valley, but is generally nearest to that side where the slope to the high ground is steepest; the opposite side of the main valley presenting a more gradual rise to the mountain summits, supplies the chief lateral valleys and feeding-streams to the river.

The origin of valleys has been a subject of considerable controversy, and this question is even now occupying the attention of geologists. At the time when a universal deluge was used to explain whatever was inexplicable in geology, it was considered to have been the agent which furrowed the earth's surface with valleys; and this opinion was entertained so lately, as to have been advocated by the late Dean Buckland in his *Reliquiæ Diluvianæ*, until Professor Fleming shewed the untenableness of these opinions.

At the present day, geologists are very much divided as to the origin of valleys. Some hold that they are the result of the operation of that internal agency which has, at different periods, so broken the crust of the earth, and changed its surface; while others maintain that various agents now operating more or less favourably in disintegrating and removing the solid materials of the exposed portion of the surface of the earth, produced the inequalities that now exist. There can be no doubt that all these have been active, and that the special advocacy of individual agents, as the sole producers of these phenomena, is the source of error, and the cause of controversy. Each and all have done their part; and in a satisfactory explanation, they must all be taken into account. That internal force has been a principal agent in producing the diversity of hill and valley, seems beyond doubt. This force acted by raising the surface perpendicularly from below upwards; by producing great faults, which presented facilities for the action of running water; or by pushing a portion of the crust forward, so as to produce immense folds, alternating with mountain ranges. The Appalachians of North America, and the associated valleys, have been produced, as has been shewn by Professor Rogers, by the last-mentioned method; and the Tertiary strata of the Alps were carried up a thousand feet, while the valley-beds of the Adriatic and the Mediterranean either remained stationary or subsided to a lower level. The fact that some valleys are only the synclinal axes between the bounding mountain systems, like the basin of Switzerland between the elevated ridges of the Alps and Jura, also confirms the opinion that some valleys owe their origin to the operations of an internal force, which operated in geologic ages in a more powerful manner than it has been known to do in historical times. In the face of such facts, it is surprising to hear practical geologists so influenced by pet theories as to assert that the action of internal force has 'no direct effect on the external features of the ground.' But this is the position of men who adhere to the strict Lyellian doctrine, that all the past changes on the earth's surface have been produced by agents now operating, and at the same rate, but through enormously protracted periods of time. But as these agents are various, so we have almost as many theories as there are agents. Lyell insists that ocean-currents, and the wear and tear of the waves, have produced the inequalities. Jukes will have it that the atmosphere has disintegrated, and the rivers carried off the materials which formerly filled up the hollowed-out valley to a level with the surrounding hills; while Ramsay declares that glaciers were the important agents in the process. That any one of these alone has produced the great changes on the surface of the earth, is a position that would be maintained only by those who are blinded by their idol of a favourite hypothesis which they have to defend. But that all of them, in addition to the operation of an internal force, have been agents, more or less, in producing the present conformation of the earth's surface, cannot be doubted. While the advocates of superficial agents so completely ignore the influence of internal force, as in the statement of Professor Jukes quoted, those who

maintain the opposite view are equally open to condemnation when they declare that the wear and tear due to atmospheric sub-aërial erosive agency never could, even after operating for countless ages, have originated and deepened any of the valleys which occur in flat countries.'—Murchison's Address at British Association, 1865.

VALLISNERIA, a genus of small, stemless, aquatic plants, with grass-like leaves, belonging to the natural order *Hydrocharideæ*, and found in the warm parts of both hemispheres. They generally grow in running waters. *V. spiralis* is particularly celebrated on account of its peculiar process of

Vallisneria spiralis:
a, female plant; *b*, male plant.

fecundation. At the time when this is to take place, the flowers of the female plants rise to the surface of the water by means of their long spirally-twisted stalks. The flowers of the male plants, in order to follow them thither, become detached, having previously grown on short spikes at the bottom of the water, and expand, floating about upon the surface. After fecundation, the female flowers return under the water by the spiral contraction of their stalks, and the fruit is ripened under water. It is found in ditches in Italy and France, and in the slow rivers of the Atlantic United States.

VALLOMBROSA, a celebrated abbey of Tuscany, situated among the Apennines, in a valley surrounded with forests of fir, beech, and chestnut-trees (hence the name, meaning 'shady valley'). Here an order of monks according to the rule of St Benedict was founded about the middle of the 11th c., who were called Vallombrosians from the name of the site, or Grey Monks, from the colour of their habit, which, however, was afterwards changed to black. They were the first to admit lay brethren. The monastery became very wealthy through donations, and the present magnificent buildings were erected in 1637. It formed a refuge for priests during French rule in Italy. After 1815, the monks resumed possession, but in very diminished numbers; and their duties are few beyond those which attach to the charge of the sanctuary, and the care of pilgrims and other strangers. The monastery and its highly picturesque environs are still much visited.

Vallombrosa was visited by Dante, celebrated by Ariosto in the *Orlando Furioso*, canto xxii., and is mentioned by Milton in the *Paradise Lost*.

VALLS, Spain. See SUPPLEMENT in Vol. X.

VALMY, a French village in the dep. of Marne, 20 miles north-east from Chalons. In 1792, the Prussians, under the Duke of Brunswick, after capturing Longwy and Verdun, were advancing towards Paris driving the army of Dumouriez before them, when Kellermann (q. v.), who commanded the army of the Rhine, learning the critical situation of his comrade, hastened to his relief with 22,000 men, and taking up his position on the heights of Valmy, awaited the advance of the Prussians. These, possessing themselves of the heights of La Lune, immediately opened a vigorous cannonade on the French, to which the latter effectively replied. The explosion of two ammunition-wagons within the French lines having thrown them into disorder, a body of Prussians, taking advantage of the confusion, advanced to the attack; but the energetic conduct of Kellermann, and the enthusiasm infused by him into his troops, restored their steadiness, and by a sudden charge with the bayonet, the Prussians were made to retire to their former position. This battle, or rather skirmish, frequently alluded to as the *cannonade of Valmy*, did not cost either army more than 800 men, but though, in a military point of view, an insignificant affair, it produced moral effects of the greatest importance. It was the first triumph of the republican arms, and with characteristic impulsiveness, the French were transferred from the depths of despair to the very pinnacle of self-confidence. When Napoleon was creating his 'noblesse,' this great service rendered to France by Kellermann was fitly remembered by his nomination as *Duc de Valmy*.

VALOIS, HOUSE OF, a branch of the dynasty of the *Capetiens* (q. v.), which possessed the throne of France from 1327 till 1589, originated in the person of Charles, second son of King Philippe III. (*le Hardi*), who obtained in 1285 the county of Valois in appanage from his father. Previously, the county of Valois had been possessed by a cadet branch of the great House of Vermandois; but on the union of the heiress of Vermandois with Count Hugh the Great, the younger son of King Henry I., and the failure of their descendants in the end of the 12th c., the Vermandois possessions, including Valois, were annexed to the French crown, till again separated in 1285, as above mentioned. But Philippe IV., the elder brother of Charles, having left three sons, who reigned in succession, and died without issue male, the succession fell, by the Salic law, to the eldest son of Charles, who accordingly ascended the throne as PHILIPPE VI. (q. v.). The elevation of the House of V. to the throne of France gave rise to long and bloody wars with Edward III. of England, who claimed the crown through his mother, Isabel, the daughter of Philippe IV., insisting that the Salic law only prohibited the 'succession' of females, and did not deny their capacity for transmitting a claim to the crown. But if Edward III.'s argument had been sound, it would have destroyed his rival's claim without benefiting himself, for the real heirs to the throne would have then been the Navarrese royal family, who were descended from the eldest daughter of Louis X. Edward, nevertheless, assumed the title of *King of France*, an example followed by all his successors till George III., and maintained his claims by force of arms till, by the mediation of the pope a partition of the kingdom was effected. The French crown fell, by regular succession of son to father, to JOHN THE GOOD (1350—1364), CHARLES V. (1364—1380), CHARLES VI. (1380—1422), CHARLES VII. (1422—1461), LOUIS XI. (1461—1483), and CHARLES VIII. (1483—1498), under the first four of whom the contest with England was carried on with spirit, at first to the advantage of the English, but latterly of the French, who, under Charles VII., succeeded in driving the English from all their strongholds, Calais alone excepted. Charles VIII. having died without leaving male issue, the crown fell to the representative of the nearest collateral male line—that is, to Louis, son of Charles, Duke of Orleans, and grandson of Louis, Duke of Orleans, the younger brother of Charles VI., who ascended the throne as LOUIS XII. (1498—1515), the first of the Valois-Orleans *régime;* but he also dying without

male issue, the succession devolved upon the descendants of his uncle, Count Jean of Angoulême, whose grandson, FRANCIS I. (1515—1547), next obtained the sceptre, which he transmitted to his son, HENRY II. (1547—1559). Henry's three sons, FRANCIS II. (1559—1560), CHARLES IX. (1560—1574), and HENRY III. (1574—1589), occupied the throne in succession; but none of them leaving lawful male heirs, and all the collateral male lines proceeding from Philippe III. having become extinct, the crown passed to the House of Bourbon (q. v.), which was descended from his younger brother, Robert.

The most distinguished cadet branches of the royal line of V. were, the ducal family of Anjou, which long contested with the Aragonese royal family the possession of Naples; the last and most celebrated ducal House of Burgundy; and the illegitimate line of Dunois and Longueville, which was so productive of eminent warriors and daring politicians.

The V. monarchs of the elder line were a succession of able rulers, who, by valour and policy, wrested France from the hands of the English, and firmly established the royal authority over their powerful, proud, and turbulent nobility; those of the younger, or *Valois-Orleans* and *Valois-Orleans-Angoulême* lines were, with the single exception of Francis I., a series of weak princes, under whose feeble rule the country was distracted by contests for power between rival nobles, and religious dissensions among the people at large, though, owing to the number of able men on whom devolved the cares of government, the country suffered less from the incapacity of its monarchs than might have been expected.

VALO'NIA, an article very extensively used by tanners, in consequence of the large quantity of tannic acid which it contains. It is the acorn-cup of a species of oak (*Quercus Ægilops*), indigenous to Asiatic Turkey. It is very largely imported into Great Britain from Smyrna and the Greek Isles; as much as 40,000 tons have been imported in one year, its value being about £14 per ton.

VALPARAI'SO, the most important trading-town of Chili, South America, is situated in the province and on the bay of the same name, about 90 miles west-north-west of Santiago (q. v.), with which it is connected by railway. It is chiefly built on a narrow strip of land, at the head of the bay. It contains theatres, colleges, hospitals, and a number of scientific and literary institutions; its streets, though narrow, are well paved; and its houses, almost all two stories high, are gaily painted, and furnished with balconies. The picturesque Bay of Valparaiso, which is generally crowded with ships, is sheltered from all quarters except the north; and in the winter months, when northern gales prevail, the anchorage is considered dangerous. In 1822, the town was nearly destroyed by an earthquake; and on several occasions since that time, its progress has been checked by the same cause: in spite of this, however, V. has made great progress within recent years, its pop. having increased from under 10,000 in 1825, to about 95,000 in 1883. Three forts and a water-battery defend the bay. Nearly 3000 vessels, of about 700,000 tons, enter and clear the port annually; the imports, which amount in value to about $17,000,000, being chiefly cotton, silk, and woollen goods, hardware, iron, sugar, wines, spirits, tobacco, &c.; and the exports, which value about $9,000,000, being chiefly copper and copper ore, silver, gold, wheat, flour, tallow, hides, and wool. V. was bombarded by the Spanish fleet, March 31, 1866. Few lives were lost, but buildings and other property, the value of which was estimated at from 9,000,000 to 20,000,000 dollars, were destroyed.

VALUA'TIONS OF LAND have been found necessary in order both to regulate liability to taxation, and in feudal times to determine the amount of casualties or occasional profits due by the vassal to the superior. Domesday Book (q. v.) contains the earliest valuation of the lands of England. Valuations were made in succeeding times, when the raising of imposts by subsidies became common, these imposts being apportioned on the people of the realm in respect of their reputed estates. Land was the chief subject of taxation, and was assessed nominally at the rate of 4*s.* per pound. But while land was rapidly increasing in value, the practice grew up of adopting an old valuation, by adhering to which the nominal 4*s.* rate came in course of time to amount to less than 2*d.* per pound. In 1692, it was resolved that a new valuation, correspondent to the existing state of the land, should be made, and a tax levied on all land throughout the realm of 1*s.* per pound, which in time of war was afterwards raised to 4*s.* This impost, called the Land Tax, was made permanent by 38 Geo. III. c. 60, which act also provided the means of enabling it to be redeemed. Though once the most productive of all the resources of the state, the land tax now furnishes a very small fraction of the revenue, and so far as not redeemed, it is still collected on the basis of the valuation of 1692, which has long ceased to be an approximate estimate of the value of land. In the collection of the income tax, the actual value, as annually fixed by commissioners and assessors, is adopted as the criterion.

In Scotland, the contributions levied in the 13th c. seem to have been made with reference to the value of the lands as ascertained, either by some general valuation, or by separate valuations in individual returns. The value as at that period was afterwards known as the *old extent*, or old valuation. In the beginning of the 14th c., land diminished greatly in value in those parts of the country that had been subjected to the ravages of war; and the Scottish parliament, in granting a subsidy to Robert I. of a tenth penny of all the rents of the laity, provided that those lands which had been wasted by the war should be revalued, and that the returns should state both the present value and the former value in time of peace. But in the course of time, as prosperity returned to Scotland, the revaluation, or *new extent*, as it was called, came to be above instead of below the old value; and it became the practice to estimate the new extent by adding a certain proportion of the old valuation, to compensate for the advanced improvement in the country, and the change in the value of money. Under Cromwell, and after the Restoration, in Scotland as well as in England, the mode of taxation adopted was first to name the sum to be raised, and then to distribute it among the counties; and an act of convention of 1667 directed that in apportioning the taxation of each county on the individual landholders, it should be in the power of the commissioners to rectify the old valuations when necessary. The rent established by these valuations is known as the *valued rent*, and continued till 1854 to be adopted for the land tax, and most of the other public and parochial assessments. By a statute of that year (17 and 18 Vict. c. 91), the commissioners of supply of every county, and the magistrates of every burgh, are directed to cause a valuation roll to be made up annually, shewing the rent or value of the whole lands and heritages within the county or burgh, by which roll all local assessments are in future to be

regulated; and provision is made for the appointment of assessors to carry out the act. By 20 and 21 Vict. c. 58, commissioners of supply and burgh magistrates are further empowered to appoint the officers of inland revenue belonging to the county or burgh as assessors; and failing their doing so, the valuations made are not to be conclusive against assessments. The new system of valuation established by these acts is perhaps the most perfect in the world; it possesses the merit of giving universal satisfaction, and is noted for its simplicity.

VALUE, in Political Economy, is one of those terms which demand attention more for the clearing away of its application to vague and fallacious uses, than for an attempt to give it strict scientific definitions. It has a distinct meaning only when it is used as 'value in exchange,' and that between things coexisting in time and place. The measure of such value is the current money of the place. So two articles, each of which will bring £5 in London, are equivalent in value there. Cost has nothing to do with value. If a bale of silk has cost £100, and from disease in the silk-worm, the price of the commodity rises, so that it will bring £150, that is its value. So also if there be a fall, so that it will only bring £75, that is its value. Vain endeavours have been made to establish a permanent standard of value for the purposes of comparing with each other the conditions of people living at long intervals. The changes which affect one thing affect all others; so that comparisons resolve themselves into the nature of fluxions. Money, so effective in estimating contemporary values, is quite useless here. Some years ago, grain, as the necessary of life, was used as a standard of value. It may be an approximate standard, while a people are so poor as to possess little more than the necessaries of life; but when a country becomes so rich that these are but a proportion of the wealth to be estimated, their capacity as a standard is gone.

Vambraced.

VA'MBRACED, in Heraldry (Fr. *avant-bras*, forearm), a term applied to an arm clothed in armour, as in the subjoined crest; a dexter arm embowed vambraced proper, the gauntlet holding a sword below the hilt in bend sinister, point downwards, argent, hilt and pommel or.

VA'MPIRE (Ger. *vampyr*), called also by the Servians *Vukodlak*, and by the Wallachians *Murony*, is, according to the popular belief of the Slavonic, Romanic, and Greek population of the Lower Danube and the Thessalian peninsula, a blood-sucking ghost. In the mythology of the ancient Greeks, beings of a similar nature existed—the Lamias, beautiful phantom women, who, by all sorts of voluptuous delusions, allured youths to them in order to feast on their fresh, young, and pure blood and flesh. And among the Greek Christians there is a belief that the bodies of those who have died in excommunication are kept by the devil in a kind of life; that they go forth from their graves by night and suddenly destroy other men, and also by other means procure food, and thus keep themselves in good condition. They are called Burkolakkä, or Tympanitä; and the only way of escaping from their molestation is by digging up their unwashed corpses and burning them, after the removal of the excommunication. The vampire proper is the illegitimate offspring of parents themselves illegitimate, or the troubled spirit of one killed by a vampire. During the day he lies as a corpse, but turned in his grave, with a florid appearance and warm blood, open staring eyes, and skin, hair, and nails still growing. But by night, especially at full moon, he wanders about in the form of a dog, frog, toad, cat, flea, louse, bug, spider, &c., and sucks the blood from living persons by biting them in the back or neck. If a dead person is under suspicion of being a vampire, his body is disinterred, and if it is found putrid it is only sprinkled with holy water by the priest; but if it is red and bloody, the devil is driven out, and on re-interring it, a stake is driven through the breast, or a nail through the forehead; or it is perhaps burned. The Vukodlaks, who are particularly greedy for the blood of young girls, pair with the Wjeschtitza, a female ghost with wings of fire, which by night sinks down on the breast of the sleeping soldier, presses him in her arms, and inspires him with her fury. As, according to popular belief, every one who is killed by a vampire becomes himself a vampire, an outward sign of the vampire bite usually remains, although not always visible and recognisable by every one; therefore, at the obsequies of every Wallachian, of whatever age or sex, there is always a skilled person, generally a midwife, called in, in order to take precautions against the corpse becoming a vampire. A long nail, for instance, is driven through the skull; it is then rubbed in various places with the lard of a pig killed on St Ignatius's day, and a stick made of the stem of a wild rose is laid beside it. Thessaly, Epirus, and the Wallachians of the Pindus know another kind of vampire still—living men who by night leave their shepherd dwellings, and, roving about, bite and tear everything that they meet, men as well as beasts. The Priccolitsch and the Priecolitschone of the Moldavo-Wallachians, who wanders about more frequently than the Murony proper, is likewise a real living man, who, by night, in the form of a dog, roams over heaths, pastures, and villages; and especially kills cattle and sucks their blood, from which cause he always looks healthy and blooming. Such a man is known by his backbone being prolonged in the form of a dog's tail. Thus, the Vukodlak and the Murony would be something analogous to the nightmare of German mythology; and the Priccolitsch, on the other hand, to the Werwolf (q. v.). The *ghouls* of the Arabs and Persians would seem to be identical with the vampires. In 1725 and 1732 exciting rumours about supposed vampires arose in Hungary and Servia, which resulted in the disinterment of numerous corpses, and caused the publication of a multitude of writings in Germany for and against the matter, among which the most important is Ranft's *Treatise on the True Nature of the Hungarian Vampire*, in which an account is given of all the writings which had appeared on the subject (Leip. 1734).

The name V. has been appropriated to blood-sucking bats. It was erroneously given to bats of the south-east of Asia and Malayan Archipelago, which are really frugivorous. The blood-sucking bats are all South American, and belong to the genus *Phyllostoma*, or SPECTRE BAT (q. v.), and genera nearly allied to it. The true vampires (*Desmodus*) resemble the Spectre Bats; they have a small bifid membrane on the nose, no tail, and the inter-femoral membrane little developed. They have two great projecting, approximate upper incisors, and similar lancet-shaped superior canines, all of which are very sharp-pointed, and arranged to make a triple puncture like that of a leech. There are four bilobiate inferior incisors, the innermost separated by a wide interval; the lower

canines are small; there are no true molars, but two false molars in the upper jaw, and three in the lower, of a peculiar form, apparently unfitted for mastication. The intestine is shorter than in any other mammal, and the whole structure seems to indicate

Vampire Bat.

that blood is the sole food. In some parts of South America, vampires are very numerous, and domestic animals suffer greatly from their nocturnal attacks. They seem to take advantage of an existing wound, but they can also make one. In some parts of Brazil, the rearing of calves is impossible, on account of these bats, and there are districts, chiefly those in which limestone rocks prevail, with numerous caves, in which cattle cannot be profitably kept. Vampires sometimes attack men, when sleeping in the open air; but the stories of their fanning their victims with their wings, whilst they suck their blood, are fabulous.

VAN, a fortified town of Turkey in Asia, stands near the south-east shore of Lake Van, 145 miles south-east of Erzerum. It is overlooked by a citadel, now much dilapidated, but which, from its position on a lofty height, might be of importance. Cotton goods are manufactured, and the bazaars are well stored with the produce raised in the vicinity. V. is always called among the Armenians Schamiramakert—i. e., Town of Semiramis—contains ancient ruins, and cuneal inscriptions are found in which the name Xerxes frequently occurs. Pop. stated at 15,000.—The Lake of Van is a considerable inland sea, 80 miles long and 50 miles in extreme breadth, though the average breadth is not nearly so great. Area, 1200 sq. miles. It is fed by about 8 streams, and has no visible outlet. Its waters are salt, and the only fish caught in it are a kind of sardines, which are salted and exported throughout Asia Minor.

VAN, a species of carriage for merchandise, sometimes covered, and in use for carrying household furniture; in other cases, open and of a lighter nature, used by shopkeepers for sending articles to their customers. Whether large or small, or with four or only two wheels, the van is set on springs, nd it might be called a spring-cart or wagon. The term van seems to be an abbreviation of caravan, which was formerly in use.

VANA'DIUM (symb. V, equiv. 59·2) is a rare metal whose discovery is ascribed by some authorities to Del Rio in 1801 (see art. 'Vanadium' in Watts' *Dict. of Chemistry*), and by others to Sefström in 1830. The last-named chemist found it in a Swedish iron ore, and gave it the name of V., from *Vanadis*, a cognomen of the Scandinavian goddess Freyja. In very small quantities, it is present in nearly all clays; but its most abundant source is the vanadiate of lead, which has been found in Mexico, Chili, and at Wanlockheak in Scotland. The metal is obtained by the reduction of vanadic acid, in the form of a brilliant powder which dissolves readily in nitric acid and aqua regia, forming a beautiful blue solution; but is insoluble in sulphuric and hydrochloric acids, even with the aid of heat. There are five oxides of V., viz., V_2O, V_2O_2, V_2O_3, V_2O_4, V_2O_5. The *dioxide*, V_2O_2, is obtained by the partial reduction of the higher oxides, is a light-grey, crystalline substance like graphite; it does not combine with acids or bases, but when heated in the air for some time it becomes converted into the *trioxide*, V_2O_3, a black powder which, in combination with acids, forms salts having a blue colour. *Anhydrous vanadic acid*, V_2O_5, is of a brownish-red colour, and forms, with bases, colourless, yellow, or red salts, both normal and acid. Of these, the *vanadate of ammonium*, $(NH_4)VO_3$, is the most important, the acid being usually obtained from it. It is stated by Mr Riley, that if vanadic acid be added to water containing tincture of nut-galls, an indelible ink is formed (*The Lancet*, December 19, 1863). It is unnecessary to notice the chlorides and other compounds of V., or to enter at length into the tests for the compounds of so rare a metal. It is sufficient to observe that these compounds, before the blowpipe, with borax in the reducing flame, give a green glass, which becomes yellow in the oxidising flame.

VANBRUGH, Sir John, an eminent architect and dramatist of the 18th c., was the grandson of a Protestant refugee of Ghent, who settled in England during the reign of Queen Elizabeth. V. is supposed to have been born in Chester (in which city his father was a merchant), in the year 1666, and to have been sent to France for his education. His artistic studies were interrupted for some time by his entering the French army, which, however, he left after attaining the rank of captain. On returning to England he must soon have acquired reputation as an architect; for, in 1695, he was made one of the commissioners for finishing the palace at Greenwich for the purposes of an hospital. His first attempt at play-writing was *The Relapse*. It was brought out at Drury Lane with such success, and obtained such popularity, that V. ranked ever after as one of the leading wits and dramatists of his day. About 1697, he wrote his famous comedy, *The Provoked Wife*, for Lincoln's Inn Theatre, where it was produced with even greater success than that which attended *The Relapse*. He then, in partnership with Congreve, started a theatre in the Haymarket, and there brought out his play, *The Confederacy*. But so ill suited was this building for speaking in, that not even the brilliant wit and racy humour of *The Confederacy* could command an audience, and Congreve abandoning the scheme, the theatre had to be closed. In 1702, he erected, for the Earl of Carlisle, the noble palace of Castle Howard, in Yorkshire; and this led to his being employed as the architect of many mansions for the noble and the wealthy in other parts of the country. His reputation was now such that he was commissioned to erect Blenheim House, which the parliament had voted to the Duke of Marlborough; but as no particular fund had been provided for meeting the expenses, and as parliament refused, when applied to, to grant any money for that purpose, the commission was more honourable than lucrative. The queen supplied from her own private purse most of the funds; but after her death, this supply was of course stopped. The Duke of Marlborough having also died, left a specific fund to be expended in meeting the architect's claims; but the duchess not only refused to pay V. his salary, but dismissed him from his office; and the house was completed

under some other management, but from the original designs. After a great deal of trouble, V. managed to get nearly all the money that was due to him; but ever after he was the sworn foe of the Duchess of Marlborough. In 1714, he was made Comptroller of Royal Works. V. died at Whitehall on March 20, 1726, leaving his well-known and popular drama, *The Provoked Husband*, unfinished. His plays can hardly be said to be popular now, their licentious tone and loose morality preventing their being read to that extent to which the brilliancy of their wit, keenness of their satire, and genuine character of their humour would otherwise entitle them. They want the polish of Congreve's dramas, yet, at the same time, they are not infected with the artificiality, stiffness, and laboured brilliancy which disfigure so many of Congreve's best scenes. The interest is well sustained throughout, the characters—such as they are—are real, natural, and racy, the situations striking, and the dialogue brilliant and unflagging. The best edition of them is contained in Leigh Hunt's *Comic Dramatists*, to which is also prefixed an excellent Life of Vanbrugh. His architectural works are still amongst the first of their kind — massive, picturesque, varied in outline, and wonderfully skilful in composition, though a frequent carelessness in the management of details spoils some of his best effects.

VANCOU'VER'S ISLAND, or QUADRA AND VANCOUVER'S ISLAND, an island off the west coast of the Dominion of Canada, belonging to the province of British Columbia, is separated from the main land on the E. by Queen Charlotte Sound, Johnstone Strait, Discovery Strait, and Strait of Georgia, and on the S. from the United States by the Strait of San Juan de Fuca. Lat. 48° 20′—50° 55 N., long. 123° 10′—128° 20′ W. It is 300 miles in length, from 30 to 50 miles in average breadth, two-thirds of which is mountain and barren rock, and is of importance not only from its great natural resources, but also from its geographical position with reference to the commerce of the Pacific, from which the British are in great measure cut off. Area, about 18,750 sq. miles. The main mass of the island is a mountain ridge, which rises in its highest peak, Mount Arrowsmith, to the height of 5900 feet, and whose buttress-like walls descend for the most part abruptly to the shore. There are, however, in many coast-districts, especially on the south-eastern and eastern sides, undulating tracts, thickly wooded in general, but here and there containing patches of open grass-land. The outline of the island is boldly picturesque. The shores are marked by abrupt rocky cliffs and promontories, by pebbly beaches and sheltered coves, with fine harbours. The western shores are gloomy and frowning in aspect, deeply indented by fiord-like arms of the sea, the banks of which are formed by steep rocks, rising like walls. The surface is diversified by mountain, precipice, hill, dale, and lake, and the whole country is more or less densely wooded, except where the mountain summits afford no foothold for plants, or where open grass-lands occur. There are no navigable rivers, and the streams, which are torrents in winter and are nearly dry in summer, are short, and are valuable only as supplying power for grist and saw mills. Springs are numerous, and the water excellent. The climate closely resembles that of Great Britain, subject, however, to modifications traceable to the position of the island. The ocean that washes its shores is throughout the whole year of a remarkably low temperature, owing to the arctic currents that sweep down along the coast, even to the latitude of San Francisco; and westerly winds blowing over the chilled sea-water modify the climate of the island considerably. Again, winds from the south-east, from the snow-covered Olympian Mountains in Washington Territory, are also cold. Owing to these causes, the climate of the island, even so far on as the middle of June, resembles a late English spring—having a clear atmosphere, bright sun, and cold winds. The winter, as a rule, is open and wet; the spring is later and colder than in England, and the summer drier and hotter. The maximum temperature is about 84° Fahr., the minimum about 22° Fahr. The colony is divided into 34 districts, of which 17 had been surveyed, and 7 unsurveyed in 1864. Only a small proportion of the surface is suited for agriculture, four-fifths being little better than barren rock. The crops generally raised are wheat, barley, oats, and peas. The green crops are turnips, mangold-wurzel, vetches, potatoes —which flourish here in unsurpassed excellence— and all sorts of vegetables. Of wheat, the average production is 25 to 30 bushels per acre; of oats, 40 bushels; barley, 40 bushels. Fruit-culture is a profitable branch of industry. Gold is found in increasing quantities; coal is abundant—32,818 tons were exported in 1865 by a single mining company; and copper, silver, lead, and other ores abound. The puma, the bear, and wolf still range in the forests; two kinds of deer are found; there are two kinds of grouse; and snipe and wild-fowl in great variety. Salmon abound. Extensive banks lie about 32 miles off the south-west shore. All of them are well stocked with fish, especially the cod, herring, haddock, whiting, halibut, and sturgeon. A company has been formed to prosecute the fisheries; and there is an extensive market along the west coast of America. Among the valuable woods of the island, the white fir, or Douglas pine, one of the best woods for spars known, is at once the commonest and most important. In some instances, this tree has been known 'to square' 45 inches *for* 90 *feet*. The cedars have an average diameter of 6 to 7 feet, and one has been measured 14 feet in diameter. Ship-building has sprung up, and is an important branch of industry. Victoria, situated at the S.E. extremity of the island, is the principal city, and is the capital of the province of British Columbia. It contained in 1881, 5925 inhabitants, the population of the whole island being about 7000.

The island was first discovered in 1592 by Juan de Fuca, was visited by Captain Cook, 1778, and in 1792 by Lieut. Vancouver, of the British navy. It was secured to Britain by treaty in 1846; previous to 1858, it was held, together with British Columbia, by the Hudson's Bay Company under lease from the crown; in 1865, V. I. and British Columbia were united under one government, and joined the Dominion in 1871.

VA'NDA, a genus of plants of the natural order *Orchideæ*. *V. cærulea*, one of the most beautiful of Indian orchids, is highly prized by cultivators in Britain, and plants are sold at prices of £3 and upwards. It has panicles of azure flowers. Dr Hooker found it on the Khasia Mountains, growing in great profusion, epiphytical upon the oak, banyan, &c.

VA'NDALS (Lat. *Vandăli*, also *Vindili* and *Vanduli*), a famous race of European barbarians, probably of Germanic, though some consider them of Slavonic origin. Procopius, who agrees with Pliny in considering them one with the Goths, states that they originally occupied the country about the *Palus Mæotis* (Sea of Azov), but it would appear that afterwards they migrated to the north-west, and settled south of the Baltic, between the rivers Vistula and Viadus (Oder). They make their first appearance, however, as a historic people in the 2d c. A. D., at which time they inhabited the north-eastern slopes of the Riesengebirge (called after them, *Vandalici Montes*), and figure as the associates

of the Marcomanni and Quadi in the plundering expeditions into Pannonia, and the wars with Marcus Aurelius. In the latter half of the 3d c., they are found in the Roman province of Dacia, along with Goths and Gepidæ. According to Jornandes, the Gothic king, Geberic, annihilated a large part of the nation on the banks of the Maros. The remainder were transplanted by Constantine to Pannonia, where they lived in peace for 60 years. But at the beginning of the 5th c., urged, it is said, by Stilicho, they abandoned their new homes, and in company with the Suevi, Alani, and other German tribes, led by their king, Godegisil, burst into Gaul, which they miserably wasted for the space of three years. Thence they swept through the passes of the Pyrenees into Spain, which experienced a similar fate; and finally, after much quarrelling and fighting with their German associates, they settled in a part of Bætica, which received from them the name of *Vandalitia* (mod. *Andalusia*). In 429, at the call of Bonifacius, governor of Africa, who, from being the most reliable bulwark which the Western Empire possessed, had been driven into rebellion by the false representations of Aëtius (see VALENTINIANUS III.), they crossed the Strait of Gibraltar, under their leader, Genseric (q. v.), in one resistless horde (numbering 50,000 to 80,000 in all), carrying devastation and ruin from the shores of the Atlantic to the frontiers of Cyrene. They were joined by the Donatists (q. v.), a sect of African heretics, and being themselves Arians, they inflicted great cruelties upon the orthodox Christians. Meantime Boniface had discovered the treachery of his rival Aëtius, and set himself, when too late, to remedy the dreadful consequences of his too credulous resentment. He advanced with a small and hastily-levied force, but was defeated with considerable loss, and driven into Hippo (now *Bona*), which he defended for more than 14 months. During the siege St Augustine died, August 28, 430. Boniface, reinforced by a Byzantine army under Aspar, now sallied out upon the Vandals, and a second defeat decided the fate of Africa. In 439, Genseric broke the peace which he had concluded with Valentinian III., in 435, and conquered Carthage. A new peace was established, which recognised the authority of the V. over North Africa from the Atlantic to Cyrene, over the Balearic Isles, Sardinia, Corsica, and part of Sicily. In 455, the V. invaded Italy, and plundered Rome for 14 days. The manner in which they mutilated and destroyed the works of art collected in the city, has originated the application of the term *Vandalism* to all similar barbarism. After the death of Genseric (477), his son, Hunneric, cruelly persecuted the Catholics; warred against the Moorish races in North Africa, who were trying to recover their independence, and kept the Mediterranean in a state of alarm by his piracies. His successors, Guntamund (d. 496) and Thrasamund (d. 523), were comparatively mild and tolerant rulers; the latter was even friendly to literature. But the warm climate, and the love of luxurious pleasure, now began to enervate the spirit of the V.; and the natives, in different parts of Africa, shewed unmistakably that they had ceased to fear them. Thrasamund was compelled to solicit aid from his brother-in-law, Theodoric (q. v.), who sent him a Gothic contingent to help him against the Moors of Tripoli. After his death, Hilderic, a son of Hunneric, became ruler, but he shewed such strong leanings towards Catholicism (owing to his long residence in Constantinople), that his subjects grew discontented, and he was overthrown by his uncle, Gelimer, in 530. This led to the Emperor Justinian sending an expedition, under Belisarius, against Gelimer, in 533. When the latter heard of the arrival of the great Byzantine general he caused Hilderic and his sons to be put to death, but was himself soon after forced to seek refuge in the wilds of Numidia. In 534, he surrendered, was carried to Constantinople in triumph, and ended his life in Asia Minor. Most of the V. were drafted into the imperial army, and 'used up' in the wars with Persia. The few who remained in Africa rapidly disappeared among the natives.—See the various histories of the Roman Empire; also Papencordt, *Geschichte der Vandal. Herrschaft in Afrika* (Berl. 1837).

VANDERVELDE, WILLIAM, commonly called the Elder, in distinction from his son of the same name, was born in 1610, at Leyden. He was bred a sailor; and having a natural aptitude for art, he busied himself in drawings of marine subjects. These becoming known, were seen to be of great merit; and in 1666, he was chosen to sail with the fleet of the famous Admiral de Ruyter, with a view to the commemoration on canvas of his exploits against the English. The sketches which he produced of several engagements which he witnessed procured him a great reputation; and in 1675, he was induced to settle in England, as painter of sea-fights to Charles II., who allowed him a pension of £100 a year. On the death of Charles, his services were retained at the same rate by his successor, James II. He died in London, in 1693, and was buried in St James's churchyard. His works were mostly colourless drawings, of great beauty and precision, many of which were afterwards painted upon in oil by his much more famous son—

VANDERVELDE, WILLIAM, the Younger, who was born at Amsterdam, in 1633. He received his education in art from his father, whom he followed to England. The designs produced by the father, the son was employed to colour; and for this service, to him also a pension of £100 a year was assigned. This official and subsidiary employment was, however, the least important part of his activity, his time being mainly devoted to the series of original works which have given him assured rank as one of the greatest of marine painters. In his rendering of the ocean, in its various moods, V. has had few equals; and his works are now highly valued by the connoisseur. The best of them are to be found in England, the Gallery at Bridgewater House being particularly rich in fine specimens. V. lived for the most part with his father at Greenwich; and after his death, in London, where, in 1707, he died.

VANDYCK. See DYCK.

VANE, SIR HENRY, a notable English politician of the 17th c., was born in 1612. His father, also a Sir Henry, was a distinguished statesman in the reigns of King James I. and Charles I., and received many proofs of the royal favour; but having taken part in the prosecution of Strafford (q. v.), he was deprived of all his offices of honour and emolument. When the parliament rose against the king, V. remained neutral; and some time before the execution of Charles, he withdrew to his seat at Raby Castle, where he died in 1654.—SIR HENRY VANE, the Younger, studied at Westminster and Magdalen Hall, Oxford, where he appears to have embraced, with all the inconsiderate enthusiasm of his character, those republican principles for which he afterwards became so famous. His travels in France and Switzerland strongly confirmed him in his aversion to the government and discipline of the Church of England, and in 1635, he sailed for New England—the refuge of disaffected spirits in

those days. He was soon after chosen by the people governor of Massachusetts; but his predilections in favor of 'Antinomian' opinions soon robbed him of his popularity, and in 1636, or thereabouts, he returned home. He now married a daughter of Sir Christopher Wray of Ashby, in Lincolnshire, and entered on a political career. Through his father's interest, he was appointed treasurer of the navy, along with Sir William Russell, and entered Parliament for Kingston-upon-Hull, in 1640, but almost immediately joined Pym and the anti-court party, of which he became one of the most vehement and resolute leaders. When the Civil War broke out, no man was more conspicuous in the military and theological politics of the time than Vane. He carried to the House of Peers the articles of impeachment against Archbishop Laud; he was a member of the Westminster Assembly; a 'great contriver and promoter of the Solemn League and Covenant' (though in his heart he abhorred both it and presbytery, and only used them as a means of crushing the bishops); the chief instrument in carrying the 'self-denying ordinance' (1644); and one of the commissioners at the treaties of Uxbridge (1644—1645) and the Isle of Wight (1648). But he did not view with satisfaction the increasing power of Cromwell and the army. He was too extravagant a parliamentarian, too much of a visionary and enthusiast, to be pleased with the supremacy of the musket and sabre, and for some time he withdrew altogether from public affairs. On the establishment of a Commonwealth, however, in February 1649, V. was appointed one of the Council of State; yet his antipathy to Cromwell, and his factious, pragmatical, hair-splitting activity so much increased, that the former, who looked upon V. as a subtle promoter of divisive courses, called him a 'juggling fellow;' and was probably in deep earnest, when, at the dissolution of the Commons, in April 1653, against which V. protested with a sort of feminine sharpness, he cried out: 'The Lord deliver me from Sir Harry Vane!' In 1656, V. wrote a book, entitled *A Healing Question Propounded and Resolved*, which was so hostile to Cromwell's protectorate, that it was found necessary to imprison the author in Carisbrooke Castle, Isle of Wight. He was released after a detention of four months; and attempts were made by Cromwell to win him over, but V. was inflexible in his fanaticism; and during the rule both of Cromwell and Richard, he maintained an attitude of sullen discontent. After meddling a little in the helpless intrigues that followed the abdication of Richard, he was ordered by parliament to withdraw to his house at Raby. When the Restoration took place, V. was one of the twenty persons excluded from the *Act of General Pardon and Oblivion;* and in July 1660, he was committed to the Tower. On the 2d of June 1662, he was arraigned, and indicted of high treason before the Middlesex grand jury, found guilty (on the 6th), and on the 14th was beheaded on Tower Hill. His son was knighted by King Charles, and raised to the peerage by King William, as Lord Barnard of Barnard Castle. V. was a subtle, restless, crotchety, unwise kind of man—a real thorn in the flesh of the great Cromwell. He was one of the Fifth Monarchy Sect, and much given to extravagant religious musings, and to praying (with his friends) in language wholly unintelligible. He also wrote several political and theological treatises, which do not require special mention.—See *The Life and Death of Sir Henry Vane, Knight* (London, 1662); Birch's *Lives;* and Ludlow's *Memoirs.*

VANGS, ropes on either side of a gaff, for steadying, or acting as braces to, a fore-and-aft sail.

VANI'LLA, a genus of parasitical *Orchideæ*, natives of tropical parts of America and of Asia; which spring at first from the ground, and climb with twining stems to the height of 20 or 30 feet on trees, sending into them fibrous roots produced from nodes, from which the leaves also grow. These roots, drawing sap from the trees, sustain the plant, even after the principal root has been destroyed. The stem is four-cornered and juicy; the leaves long and fleshy. The flowers are in spikes, and are very large, fleshy, and generally fragrant. The fruit is a pod-like, fleshy capsule, opening along the side. The *Vanilla* of commerce was formerly supposed to be the fruit of *V. aromatica*, a native of tropical America, but is now ascertained to be chiefly, if not

Vanilla aromatica.

wholly, the fruit of *V. planifolia*, a species indigenous to Mexico, Guiana, Brazil, Peru, &c., and cultivated also in some of the West India Islands, the Mauritius, and Ceylon. The fruit is cylindrical, about a span long, and less than half an inch thick. It is gathered before it is fully ripe, dried in the shade, and steeped in a fixed oil, generally that of the cashew nut. It contains within its tough pericarp a soft black pulp, in which many minute black seeds are embedded. V. appears in commerce in packets of 50—100 pods, wrapped up in cane-leaves and sheet-lead, or in small tin boxes. It has a strong, peculiar, agreeable odour; and a warm, sweetish taste. The interior pulp is the most aromatic part. Benzoic acid is sometimes so abundant in it as to effloresce in fine needles. V. is of little use in medicine, although it is a gentle stimulant and promotes digestion, and in large doses is said to be a powerful aphrodisiac; but it is much used by perfumers, and also for flavouring chocolate, pastry, sweetmeats, ices, and liqueurs. Balsam of Peru is sometimes used as a substitute for it, as it is expensive, and the whole quantity imported into Britain does not exceed four or five cwt. annually. It is in very general use in South America. Several kinds are distinguished in commerce. The best is that called *Leg* or *Lec*, which is almost of a black colour, and covered with crystals of benzoic acid. Another kind, less fragrant, drier, and of a darker colour, is known as *Simarona*. A still inferior kind, with much broader, brown capsules, is called *Pompona*, or *Bova*. When the fruit of V. is fully ripe, liquid (*Baume de Vanille*) exudes from it, which is unknown in Europe, but is valued in Peru. V. has ripened its fruit in British hot-houses, but the

flowers are apt to fall off without fruit being produced, unless care is taken to secure it by artificial impregnation. This is, in some measure, the case even in the East Indies, and in some parts of America itself; and it is supposed that the presence of some insect, delighting in the flowers of the V., makes it more productive in other parts of America, especially in Mexico.

VANLOO, JEAN BAPTISTE, a member of a family originally Flemish, in which a love of art seemed indigenous, was born at Aix in Provence in 1684. His grandfather and father were both painters of some talent, and under the instruction of the latter, whilst yet a mere boy, he is said to have attained considerable proficiency as an artist. Subsequently, he settled himself as such at Nice, and afterwards at Toulon, where he married the daughter of an advocate. On quitting Toulon, on the occasion of its being besieged by the Duke of Savoy in 1707, he returned to his native place, and abode some years there. He was again at Nice in 1712, and in the year following he visited Genoa and Turin. At the latter of these cities, he won the favourable regard of the Prince of Carignano, son-in-law of the Duke of Savoy, and was sent by him to study at Rome as a pupil of Benedetto Luti. After a further residence at Turin, he proceeded in 1719 to Paris, where apartments were assigned him in the hôtel of the prince his patron. Here he speedily acquired a great reputation as a portrait-painter. He was made a member of the Academy in 1731, and Professor of Painting in 1735. The loss of a large sum of money in the Mississippi Scheme induced him to come, in 1738, to London, where his portraits soon distanced all rivalry. His health, however, having given way, he retired in 1742 to his native district, Provence, where he died in April 1746.

Though chiefly eminent in portrait, V. had also considerable talent as a painter of historical subjects, and executed many works of this kind, in some of which a distinct merit is still recognised.

VANLOO, CHARLES ANDRÉ, younger brother of the preceding, was born in 1705, at Nice. As a boy, he was with his brother at Rome, and studied under Benedetto Luti. He accompanied his brother in 1719 to Paris, where, after some little interval in which he was employed as a decorative artist at the Opera-house, he betook himself to portrait-painting. He returned in 1727 to Rome, and there he executed some works which laid the basis of his future reputation, procured him, through the influence of the Cardinal de Polignac, a pension from the king of France, and in 1729, the title of Cavaliere from the pope. On leaving Rome, he visited Turin, painted there for the king of Sardinia a series of subjects from the *Jerusalem Delivered* of Tasso, and returned to Paris in 1734. The year following, he was made a member of the Academy, and his subsequent career was one of full prosperity. Tempting offers were made him by Frederick the Great, who desired to have him in his service; but he declined them in favour of a nephew, preferring to remain in Paris. In 1751, he was made by Louis XV. a knight of the order of St Michael; and in the course of the same year, he became Director of the Academy. In 1762, he was made chief painter to the king; and three years after he died. As the last really great specimens of the old French school of historical painting, his works have still their admirers.

VANNES, a seaport town of France, capital of the dep. of Morbihan, stands at the mouth of the Vannes, which falls into a narrow inlet of the Gulf of Morbihan, 310 miles west-south-west of Paris by railway. The town is surrounded by high walls flanked with towers. The cathedral is the most important edifice. Manufactures of linen and woollen cloth and ship-building to some extent are carried on, as well as commerce in honey, wax, wine, and hemp. Pop. 14,564.

VAN RENSSELAER, STEPHEN, known as 'the Patroon,' an American statesman, and patron of learning, was born in New York, Nov. 1, 1769, the fifth in descent from Kiliaen Van Rensselaer, the original patroon or proprietor of the Dutch colony of Rensselaerwick, who in 1630, and subsequently, purchased a tract of land near Albany, 48 miles long by 24 wide, extending over three counties. He was educated at Princeton and Harvard Colleges, and married a daughter of General Philip Schuyler, a distinguished officer of the Revolution. Engaging early in politics, at a period when they were the pursuit of men of the highest social position, he was, in 1789, elected to the state legislature; and in 1795, to the state senate, and became lieutenant-governor, president of a state convention, and canal commissioner. Turning his attention to military affairs, he was, at the beginning of the war of 1812, in command of the state militia, and led the assault of Queenstown; but the refusal of a portion of his troops, from constitutional scruples, to cross the Niagara river, enabled the British to repulse the attack, and the general resigned in disgust. As president of the board of canal commissioners for 15 years, he promoted the New York system of internal improvements; as chancellor of the state university, he presided over educational reforms; and as president of the agricultural board, aided to develop the resources of the state. At his own cost, he employed Professors Eaton and Hitchcock to make agricultural surveys, not only of his own vast estates, but of a large part of New York and New England, the results of which he published in 1824; he also paid Professor Eaton to give popular lectures on geology through the state. In 1824, he established at Troy an institution for the education of teachers, with free pupils from every county. Widening the sphere of his political interests, he went to Congress in 1823, and served several terms, exerting a powerful influence, and securing the election of John Quincy Adams as President of the United States. After an active, useful, and honourable career, worthy of his high position, he died at Albany, January 26, 1839.

VAN VEEN, OTHO (called also OTTOVENIUS), an eminent painter, was a native of Leyden, of which city his father was a wealthy burgomaster. The exact year of his birth is involved in some obscurity; but there seems tolerable evidence to fix it as about 1556—1557. He received a careful education, and in aid of the natural talent he displayed for drawing, the best masters were procured him. When about 15 years old, he was sent to Liége, whence, after a residence of three years, he proceeded to Rome, where he became a pupil of the celebrated Zucchero. In Italy, he remained about eight years; and on his return home by way of Vienna, the emperor, by tempting offers, vainly endeavoured to detain him in his service. It is significant of the estimation in which he had come to be held as an artist, that on his passing through Munich and Cologne, similar offers were pressed upon him. These also, however, he declined, wishing to settle in his native country. Finally, he went to reside at Brussels, as painter to the famous Alexander Farnese, Duke of Parma, and then governor of the Spanish Netherlands, of whom he executed a masterly portrait in armour, which greatly increased his reputation. The duke having died, he established himself at Antwerp, and opened an Academy, at which the great Rubens was one of his pupils.

in the matured art of Rubens, traces of his master are still, it is thought, to be detected; and in particular, he is held to have in all probability derived from him that fondness for allegorical and emblematic subjects which possessed him not always to his advantage. On the occasion of the entry into Antwerp of the new governor, the Archduke Albert of Austria, Van Veen was employed to design the arches and the other decorative business of the ceremonial, and so pleased was the duke with the taste and invention displayed, that he appointed him Master of the Mint at Brussels, to which city he returned to reside. An invitation to Paris was subsequently sent him by Louis XIII., but this he saw fit to decline; and in Brussels, at the age of 78, he died.

The chief works of Van Veen are religious pictures for churches. In the cathedrals of Leyden, Antwerp, and Bruges, good specimens may be found. On their own account, they deserve attention; but it is chiefly as 'the work of a man who had the honour to be the master of Rubens' (to quote the words of Reynolds), that they now for the most part receive it.

VA'POUR. As all *solids*, with the exception of carbon (an exception most probably due to our not being able to produce a sufficiently high temperature), are melted, or rendered *liquid* by the application of Heat (q. v.), so a further application of heat converts them into *vapour.* A vapour is really a gas, but it requires a little consideration to convince ourselves of the fact. Perhaps the best proof that can be given is that supplied by the beautiful experiments of Faraday (q. v.) and others on the liquefaction of gases. With a few notable exceptions, such as hydrogen, oxygen, and nitrogen, all gases have been liquefied by a proper application of pressure or cold, or of cold and pressure combined. The difference, in common language only, between a vapour and a gas is this: A gas is a substance which at ordinary temperatures and pressures exists in a state of vapour; while a vapour is produced by the application of heat to a substance which is ordinarily found in the solid or liquid form. In other words, gases are the vapours of substances which, in the liquid form, boil at very low temperatures.

The most familiar instance of vapour is aqueous vapour, or Steam (q. v.). At all temperatures, even as low as the freezing-point, ice and water give off vapour; and the quantity produced is determined by the temperature alone: that is, Evaporation (q. v.) at any temperature continues (more or less slowly according to the quantity of air or other gas which is present) until the pressure exerted by the vapour upon the containing vessel attains a certain definite value, depending on the temperature alone. If the temperature be such that the corresponding vapour-pressure is equal to the pressure of the air, vapour comes off freely, and we have the phenomenon called boiling.

Vapour in a vessel which contains some unevaporated water is thus always *saturated*, as it is called, i. e., the full amount of vapour capable of existing at the temperature of the vessel is present. If it be compressed, some is liquefied; if allowed to expand, more vapour is formed.

If, however, there be no water present in the liquid form, and the temperature be gradually raised the pressure of the vapour will rise, but much more slowly than when water is present, because no more vapour can be formed. In this state, that of *superheated* steam, vapour behaves almost exactly as an ordinary gas.

Chlorine, carbonic acid, sulphurous acid, &c., thus exist at ordinary temperatures as *superheated* vapours; and can therefore be reduced by cold and pressure to the condition of *saturated* vapour, when they are easily liquefied by carrying the process further.

There is little doubt that if sufficient cold and pressure could be applied as easily as they can be produced, even oxygen and nitrogen would be liquefied. With regard to hydrogen, we are not entitled to be quite so certain; as it may possibly require an amount of cold which we may never have the means of producing.

Aqueous vapour may be liquefied by cold alone, or by pressure alone, as we have seen; and at ordinary temperatures, it is easy to liquefy sulphurous acid, ammonia, and even carbonic acid and laughing gas, by mere compression. Gases absorbed by charcoal, or by spongy platinum, i. e., condensed by intense molecular forces on the large surface presented by the interstices in these bodies, must in all probability exist in the state of liquids. Carbonic acid is liquefied when exposed to a pressure of 35 atmospheres at ordinary temperatures; and some varieties of charcoal absorb from 80 to 100 times their bulk of this gas. Remembering that, on account of the impenetrability of matter, the gas can only be in the *pores* of the charcoal, and that their whole bulk forms but a small fraction of that of the charcoal itself, we see that in all probability the absorbed gas must be condensed so enormously as to have become liquid. It is probable that in Graham's recent process, for separating by dialysis (see OSMOSE) the oxygen and nitrogen of the atmosphere, the film of vulcanised india-rubber which is employed as septum compels these gases to pass through its pores in a liquid form.

Some extraordinary experiments, due to Cagniard de la Tour (the inventor of the SIRÈNE, q. v.), have given us valuable information on the subject of vapours. He shewed that when water, ether, and other liquids are hermetically sealed in glass tubes, so as to fill from a quarter to a half of the tube, the application of the requisite amount of heat is sufficient to convert the whole into vapour. This vapour, therefore, has a density equal to half or quarter of that of the liquid! Ordinary steam from boiling water has only about $\frac{1}{1700}$th of the density of water (in common language, a cubic inch of water gives a cubic foot of steam). These experiments are very dangerous.

The most recent experiments of this nature are due to Andrews. Having, by mere pressure, partially liquefied carbonic acid in a glass tube, he raised the temperature gradually, and observed that the demarcation between the liquid and the gas became less and less definite; the capillary curvature of the surface of the liquid also diminishing. At about 88° F., the liquid surface became horizontal, and the liquid disappeared. The tube then appeared to be filled with a homogeneous substance, neither gaseous nor liquid; apparently a new state of matter. When the temperature was slightly diminished, or the pressure relaxed, there was a singular appearance of flickering striæ, such as one sees on mixing alcohol and water, or on looking through the column of irregularly heated air rising from a hot body. No pressure that Andrews could apply, not even 400 atmospheres, could liquefy this gas when its temperature was above 88° F. It appears that hydrogen, even at the lowest temperature we can produce, is *above* the point at which no application of pressure can liquefy it.

VAR, a dep. in the extreme south-east of France bounded on the S. and S.-E. by the Mediterranean, and on the N.-E. by the recently erected dep. of Alpes Maritimes. See ALPES MARITIMES in

Supplement. Area, 2348; pop. (1872) 293,757. The dep. receives its name from the river Var, which formerly served as its boundary on the east, but which, since the arrondissement of Grasse was taken from the dep. of Var, and added to that of the Alpes Maritimes, now belongs entirely to the latter. Var is well watered by a great number of streams, of which the chief are the Gapau, Argens, and Bianson. In the north and north-east, it is mountainous, being traversed by a branch of the *Alpes de Provence*, called the Monts de l'Esterel. Between the mountains and the water-courses are many very fertile valleys. The climate of Var, tempered by the altitude of the surface, is pleasant. Fruits of all kinds are here cultivated with remarkable success; tobacco is grown, and 17,600,000 gallons of wine are produced annually. The dep. abounds in minerals; an active commerce is carried on, the exports being chiefly wine, fruits, olive oil, and other agricultural and horticultural products. It is divided into the three arrondissements of Draguignan, Brignoles, and Toulon. Capital, Draguignan.

VARA'NGIANS (Ger. *Warâger*, or *Wäringer*), a Norman people of the Baltic coast, who greatly damaged by their piracies the commerce of the republic of Novgorod, and subjugated repeatedly the Slavic and Finnish peoples of Northern and Central Russia. They forced the Krivitches, Tschudes, and other tribes to pay tribute, and wrested from the Russians the districts now known as Revel, Petersburg, and Archangel; the Russians retreating into Finland and Karelia. Gradually the two nations became intermixed, and towards the 9th c., the names Russian and Varangian appear to have been considered synonymous. In 862, the rulers of this Russo-Varangian nation, Rurik (q. v.), Sineous, and Truvor, were invited by the federative state of Novgorod, in which the Slaves were dominant, to put themselves at its head, and Rurik accepting the invitation, founded the Russian monarchy. See RUSSIA. The V. were at first distinguishable in various ways above the other peoples of the Novgorod state; but being far inferior in number, were soon forced to adopt the Slavic tongue, conform to Slavic manners, and so become merged in the predominant population. The great success which attended this experiment of the Novgorod confederacy, induced other Slavic states which were located on the Dnieper to put themselves under the protection of the warlike V.; and accordingly we find, soon after 862, a second Slavic state at Kiev, under the rule of Oskold, a Varangian chief, and the conqueror of the barbarous Chazars. After Rurik's death, his successor in power, the Regent Oleg, united Kiev to Novgorod, making Kiev the capital—a position it held till supplanted by Moscow (q. v.).

VARA'NIDÆ, a family of saurian reptiles, having a very elongated body, without a dorsal crest; strong legs, and long unequal toes; the tail long and slightly compressed; the scales tuberculous, and arranged in rings; the tongue protractile, dividing into two points as in serpents. Some of them are aquatic, and some inhabit dry and sandy places. The terrestrial species have the tail conical; the aquatic species have it compressed and often crested, so that it becomes a powerful organ of locomotion in water. The motion of the terrestrial species is aided by the tail, and is always serpentine. Some of the V. attain a large size. They feed on animal food of any kind, and have been seen to attack a young deer swimming across a river. The species are not numerous, and belong chiefly to the eastern hemisphere.

VARA'ZZÉ, a small town of Northern Italy, on the Gulf, and 18 miles south-west of the city of Genoa. Some trade in wood and extensive construction of fishing-boats are here carried on. Pop. 8262.

VA'REC, an old name for crude carbonate of sodium.

VARE'SÉ, a town of Northern Italy, in the province of Como, and 13 miles west of the town of that name. It is a handsome town; contains a number of fine palaces and magnificent villas; and carries on manufactures of silk, cotton, paper, and hats. Pop. 5030. V. is of very ancient origin. The Romans kept it strongly garrisoned as a stronghold against invasion from the north.

VARIA'TION, in Music, a transformation of a melody by melodic, harmonic, contrapuntal, and rhythmic changes. The subject chosen is called the theme; it is first simply harmonised with or without an introduction, and then repeated in a variety of different transformations, and the variations collectively with the theme constitute the piece. Occasionally, the different variations are combined by an intermediate passage; but generally each has its separate close, and the whole terminates with an extended and richly-developed variation or a coda.

VARIATION OF THE COMPASS. See TERRESTRIAL MAGNETISM.

VARICE'LLA (Lat., a little pimple), popularly known as CHICKEN-POX (q. v.).

VARICOCE'LE (known also as CIRCOCELE) is a term used in Surgery to designate a varicose state of the veins of the spermatic cord. It is caused by the same conditions which give rise to Varicose Veins (q. v.) elsewhere—viz., weakness of structure, combined with obstruction through corpulence, constipation, &c., to the return of the venous blood. For a description of its symptoms, and of the suitable treatment, we must refer to any ordinary textbook of Surgery.

VA'RICOSE VEINS. When a vein becomes dilated at a certain part of its course, for no apparent physiological object, such as relieving the venous circulation elsewhere (as, for example, in the case of the superficial abdominal veins enlarging in order to relieve a compressed vena cava), it is said to be varicose, the actual dilatation being called a *varix* (a word used in this sense by Cicero and Celsus). Some veins seem to be unaffected by varices, which, however, are of common occurrence in the sub-mucous veins of the rectum (constituting hæmorrhoids or piles), in the spermatic veins, giving rise to Varicocele (q. v.), and in the veins of the lower extremities. They are occasionally (but very rarely) found in other veins. Certain conditions of the system favour the formation of varices, amongst which may be noticed an indolent temperament, and a debilitated condition of the general system, accompanied by a relaxed state of the walls of the veins; and possibly also a congenital predisposition or hereditary tendency. Persons with such a predisposition are more likely to suffer from this affection if their occupation is one which involves much standing or walking; and cooks, washerwomen, and foot-soldiers have been selected as specially prone to varicose veins. Varices may occur at almost any period of life, but are chiefly developed during middle age. Their formation is aided by any condition of the system which impedes the circulation, as certain diseases of the heart, lungs, and liver; and by continued *high living*, which is especially liable to induce hæmorrhoids. From the researches of Andral, it appears that in varicose veins the coats of the dilated vessels may become

thickened or may become thin; that they may be lengthened so that the veins become tortuous; and that the dilatation may be unequal, giving rise to the formation of pouches; and that, in consequence of the enlarged caliber of the vessels, the veins only act imperfectly, and gradually undergo degeneration. Varices occurring in the leg, to which our remaining observations apply, commonly give rise to deep-seated aching pain in the limb, with a sense of weight, fulness, and numbness, before there is any external appearance of the affection. In a more advanced stage, the ankles swell in the evening, and the feet are always cold. After a time, a small tumour of a bluish tint appears, which disappears on pressure, but returns on the removal of the pressure, and is caused by a dilating vein. This dilatation extends, and forms knotty, irregular tumours, soft to the touch, diminishing on pressure, or on the patient's assuming a horizontal posture, and giving a bluish tint to the adjacent skin. These tumours commonly occur in the middle of the leg, along the track of the saphena veins, but they often extend along the whole of the leg and thigh. With regard to treatment, it may be mentioned that old varices cannot be cured, except by operations dangerous to life, although much may be done for their relief. In their earlier stages, they are, however, more amenable to treatment. As the disease is a very common one, we shall enter somewhat in detail into the palliative treatment which any one may adopt for himself. The venous circulation of the limb should be as much as possible facilitated by the disuse of garters; by keeping the limb (if the means and condition of the patient permit it) in a horizontal position for a month or six weeks; by prohibiting walking, and allowing only carriage-exercise, with the leg elevated to the horizontal position. The limb should also be carefully bandaged from the toes to above the knee, the bandage being replaced daily, and the limb then well rubbed with the hand, or with a flesh-brush, for ten minutes or more, from below upwards, so as to stimulate the circulation. When the circumstances of the patient hinder this treatment, elastic stockings may be tried during the day, or ordinary bandages, with a pad of lint placed on each varicose cluster before the bandage is applied. In cases where only one or two trunks are affected, the disease may be prevented from extending by the application of pieces of wash-leather spread with soap-plaster firmly over them. At the same time, the general health must be attended to. Ill-nourished, feeble patients must be treated by tonics and nourishing diet; while over-fed, plethoric patients require mild but often repeated purgatives to relieve the portal circulation. In the numerous cases in which there is a relaxed condition of the veins, the tincture of sesquichloride of iron may usually be given with advantage in half-drachm doses thrice daily in half a tumbler of water, with a colocynth pill every second night, to obviate the constipating action of the iron. Amongst the means of effecting a *radical cure*, by causing coagulation of the blood in the dilated veins, when they shrink and contract permanently, are (1) caustic potash applied over the course of the vessel, (2) subcutaneous incision of its walls, and (3) compression of the vessel between a steel pin and a twisted suture. We believe that the cases are rare in which the pain of the varix is so great as to disqualify a patient from his ordinary work, and these are the only ones in which any of these operations should be recommended; 'and the patient,' says Mr Callender, 'if wise, will be contented with the palliative measures of a more simple character.'—Holmes's *System of Surgery*, vol. iii. p. 321. Amongst the troublesome consequences of varicose veins are the obstinate ulcers, known as varicose ulcers, to which they give rise; and it must be borne in mind that occasionally, when the skin gets thinned by prolonged pressure, the varices burst through it, and give rise to hæmorrhage, which, if not promptly stopped, may cause fainting, and even death. When such an accident occurs, the patient should at once be placed in a horizontal position, and the leg raised, in which case the bleeding will probably cease. If it continue, a pad of lint must be pressed upon the mouth of the bleeding vessel by means of a few turns of a bandage round the limb.

VARI'ETY, in Natural History, a term employed to designate groups subordinate to Species (q. v.). Varieties are regarded as less permanent than species; and those who regard species as perfectly distinct in their origin, look upon varieties as modifications of them due to particular causes. Of course those who adopt Darwin's view of species do not deem the distinction between species and varieties so important, but rather consider varieties as species in process of formation. However this may be, all naturalists acknowledge a difficulty of deciding what are varieties and what are species; and some reckon as varieties what others regard as distinct species. The whole subject is involved in difficulty, and must be studied both with respect to general principles, and to the peculiarities of particular cases. Whatever theory may be adopted, many of the groups now distinguished by particular names are doubtful, and their designations must be regarded as merely provisional. It cannot be certainly said whether they are varieties or species. The term *Variation* has been employed by some authors to designate forms less permanent than varieties, but the term has not obtained general acceptance.

VARI'NAS, a town of Venezuela, on the San Domingo, 90 miles south-east of the nearest shore of Lake Maracaybo. It stands at the entrance to a valley covered with tobacco-plantations. V. carries on a trade in tropical productions and in cattle. Pop. stated at 12,000.

VARI'OLA. See SMALLPOX.

VA'RIX. See VARICOSE VEINS.

VA'RNA, an important fortified seaport of European Turkey, in Bulgaria, on the northern side of a semicircular bay, an inlet of the Black Sea, 180 miles north-north-west of Constantinople. It stands on a sandbank, and the city wall, the base of which in some places is 20 or 30 feet above sea-level, is in other places on a level with high-water. The defences towards the sea are mounted with heavy cannon. The town itself is crooked, irregular, dirty, and dilapidated, and as viewed from the sea, it presents a huge jumble of red-tiled houses, interspersed here and there with mosques and minarets. Pop. 26,000, among whom are many foreign traders. The allied French and British troops were here encamped for some time in 1854. The harbour of V. is exposed to the south and south-east winds, nevertheless a considerable trade is carried on, although there are no consular reports as to the extent and character of that trade.

VA'RNISH is a solution of some resinous material in any proper solvent, alcohol and oils being the ones chiefly employed. The solution must be of such consistency as to enable it to be very thinly and smoothly spread over the surface intended to be varnished, so that when it dries, it leaves a thin resinous coating, which is either naturally glossy, or can be made so by mechanical polishing. From the extremely inflammable nature of the material

employed, the preparation of varnish is extremely dangerous, and should not be attempted except in premises specially adapted for the purpose, and with skilled workmen. The resinous gums, such as copal, anime, and mastic, and the various kinds of lac, are those chiefly used; the copals and anime are employed in making the oil-varnishes, and the lacs and gum-mastic for spirit-varnishes. Heat is required with both kinds of solvents, and it is obtained by hot-water baths as a means of safety. Colouring matters are added to some varnishes, especially to those used on metal, as the lacquer varnish used to protect the polished surface of brass, which is coloured with gamboge and turmeric. Saffron, aloes, dragon's-blood, and asphalt are also used to give yellow, brown, red, and black colours.

VARNISH TREE, a name given to several trees of the family *Anacardiaceæ*, the resinous juice of which is used for varnishing or for lacquering. The BLACK V. T. (*Melanorrhœa usitata*) is described in the article MELANORRHŒA; the JAPAN V. T. (*Rhus vernicifera*) in the article SUMACH. Another tree, valuable for the varnish which it yields, is *Stagmaria verniciflua*, a native of Java, Sumatra, Borneo, Celebes, and other East India islands. The juice is extremely acrid, and soon hardens into a black resin. To obtain it, pieces of bamboo are inserted into the bark, and allowed to remain all night, as the juice flows more freely by night than by day. It sells at a high price. It is prepared for use by boiling it with equal parts of oil, obtained from the fruit of the *Mimusops elengi*. The exhalations of the tree are said to be very noxious.

VA'RRO, 'the most learned of the Romans,' so called from his vast erudition in almost every department of literature, was born 116 B.C., and educated first under L. Ælius Stilo Præconinus, and then under Antiochus, a philosopher of the Academy. V. served with distinction in the wars against the Mediterranean pirates and Mithridates; but afterwards as legatus of Pompey in Spain, he was compelled to surrender his forces to Cæsar. He continued to share the fortunes of the Pompeian party till its defeat at Pharsalia, after which he solicited and obtained his pardon from Cæsar, by whom he was employed to collect and arrange the great library designed for the public. The next period in V.'s life was spent in literary retirement, chiefly at his villas near Cumæ and Tusculum. When the 2d triumvirate was formed, his name was enrolled in the list of the proscribed; but he succeeded in escaping, and, after some time spent in concealment, he was received under the protection of Octavian. The residue of his long life was spent in the tranquil prosecution of his favourite studies, rendered all the more arduous by the destruction of his magnificent library. He died in his 89th year, 28 B.C. V. was not only the most learned, but also the most prolific of Roman authors. He himself confesses to having composed no fewer than 490 books; but only two of these have survived, and one of them in a fragmentary state. The most considerable of his writings, whether lost or extant, are as follows: 1. *De Re Rusticâ, Libri III.*, still extant, and though written in the author's 81st year, constituting the most important treatise on ancient agriculture known to us. 2. *De Linguâ Latinâ*, a grammatical work, which originally extended to 24 books, only six of which, however, have come down to us, and even these in an imperfect form. But for this treatise, mutilated as it is, we should be ignorant of many terms and forms, as well as of much recondite information regarding the civil and religious usages of the ancient Romans. 3 *Sententiæ*, consisting of 165 pregnant sayings strung together, not by V. himself, but probably by different hands at different times. 4. *Antiquitatum Libri*, comprising two sections, the *Antiquitates Rerum Humanarum*, in 25 books, and the *Antiquitates Rerum Divinarum*, in 16 books. This the greatest work of V., and on which his reputation for learning was mainly founded, has unfortunately perished, all but a few fragments. From the 2d section, St Augustine drew much of his well-known work, the *City of God*. 5. *Saturæ*, composed in various metres, and occasionally in prose. These pieces, copied to some extent from the productions of Menippus the Gadarene, were apparently a series of comments on a great variety of subjects, generally conveyed in the form of dialogue, and aiming at the enforcement of some moral lesson or serious truth in a familiar and even jocular style. Of these we have only fragments; and of the other works little more than the titles. The best edition of the *De Re Rusticâ* is that of Schneider (Leip. 1794—1797); of the *De Linguâ Latinâ*, that of Müller (Leip. 1833).

VARUN'A (from the Sanscrit *vr'i*, surround; hence, literally, 'the surrounder,' and kindred with the Greek *Ouranos*) is, in the Vedic Mythology of the ancient Hindus, one of the *Âdityas*, or offsprings of *Aditi*, the deity of space, and amongst these, one of the most prominent. He is often invoked together with *Mitra*, sometimes together with *Agni*, the god of fire, or with *Indra* (q. v.), or other elementary deities; but frequently he is also separately praised by the poets of the Vedic hymns. The character of V., as is the case with other Vedic deities, does not appear to have been or remained the same throughout the whole period represented by the Vedic poetry, but, on the contrary, to have varied according as new imaginations were connected with the idea out of which he arose. Originally, *Varun'a* seems to have been conceived as the sun from the time after its setting to that of its rise; while *Mitra* probably represented the sun at its rise. The night is therefore said to be V.'s, and the day Mitra's; and the 'ever-going Varun'a grants a cool place of rest to all moving creatures, on the closing of the eye (of *Savitr'i*, the sun).' As a consequence, the sun, as manifest during its daily course, is spoken of as his infant, and he 'prepares a path for the sun;' and the dawn, which is called the golden light of Mitra and V., 'goes before Varun'a.' Out of the mysteriousness with which night is easily endowed, and the qualities which imagination may ascribe to the luminous origin of V., then probably grew the moral attributes given to this deity; for he is extolled as the guardian of immortality; as the cherisher of truth; as armed with many nooses, with which he seizes evil-doers; as the forgiver of sins, and as having unlimited control over mankind. 'No one rules for the twinkling of an eye apart from him,' and he witnesses man's truth and falsehood. The functions of sovereign authority which are then also attributed to him are probably a consequence of his character as protector of the good, and punisher of the wicked; but his kingly might is, in some hymns, also associated with the power, predicated of him, of 'setting free the water of the clouds,' or of 'ruling over the waters that are in heaven and earth.' Whether the connection of V. with the element of water arose from the association of moisture with night, or, which is more likely, from the notion, that water (*vâri*, from the same radical, *vr'i*, as V.) envelops or surrounds the earth, as darkness does, may be doubtful; but it is worthy of notice that the passages of the R'igveda in which V. is spoken of as the cause of rain, or as the lord of rivers or the sea, are few, and perhaps do not belong to the earlier portion of R'igveda poetry. See, for more

detail, J. Muir's 'Contributions to a knowledge of the Vedic Theogony and Mythology,' in the *Journal of the Royal Asiatic Society* for 1864. Compare also the article VASISHT'HA.—It is in this latter character alone, however, that V. appears in the classical and Purânic mythology; for there he has ceased to impersonate the sun, when invisible, and though, at that period too, he is still mentioned as an Âditya, his real quality is that of the regent of the waters, and more especially of the ocean, personified. As such, he retains, it is true, the Vedic qualities as 'lord of punishment,' and carries the 'noose' to bind the wicked with; these attributes, however, are, then, not the reflex of his solar omniscience and power, but that of his might as the god of water.—Later fiction makes him also the regent of the west, probably in recollection of his Vedic character as the setting sun; and endows him with a wife, *Varun'âni*, a son, *Pushkara*, and sometimes also with a daughter, *Punjikasthalî*. It further gives him for a residence the fabulous mountain, *Pushpagiri*, 'the mountain of flowers,' and a marine monster, *Makara*, for his vehicle.

VARUS, PUBLIUS QUINTILIUS, a Roman of noble birth, was appointed governor of Syria, and on his return from that post, was sent by Augustus to command the armies of Germany. His instructions, also, were to introduce into that country the regular administration of a Roman province. The Germans were indignant at his proceedings, and under the leadership of a chief of the Cherusci, named Arminius (Latinised from Herman), attacked V., who, with three legions, the usual number of auxiliaries, and a strong body of cavalry, had proceeded as far as the Weser. By false intelligence, the proconsul was induced to quit his intrenched camp. The Romans marched in a long straggling line, encumbered with baggage, with their wives and children. Suddenly, they were assailed by the Germans in a forest, and it was with difficulty they forced their way to a clear space to encamp for the night. For the next two days, the Romans struggled on, marching and fighting, with decreasing forces, and exhausted strength, intending to reach, if possible, the fortress of Aliso on the Lippe. Near Kreutzberg, they were met by the main force of the Germans, and completely broken. V. killed himself in despair. Augustus, who was now old and weak, is said to have yielded to transports of grief, calling upon V. to give him back his legions. This victory of the Germans was gained 9 A.D., and rolled back the tide of Roman conquest. The Rhine, instead of the Weser, again became the boundary of the empire. The battle has ever since been a proud recollection for the Germans, and is known by the name of Herman-schlacht, that is, Herman's fight.

VA'RUS is a term employed in Surgery to designate a variety of Club-foot (q. v.). The corresponding Latin word signifies 'having the legs turned inwards, knock-kneed.' It may be regarded as the opposite to Valgus (q. v.), and as in the case of that word, *Talipes* must be understood. In the form of club-foot termed varus, (1) the heel is raised; (2) the inner edge of the foot is drawn upwards; and (3) the anterior part of the foot is twisted inwards, so that the patient walks on its outer edge.

VA'SARHELY, or HÓDME'ZÖ-VA'SARHELY, a town of Hungary, stands on a marshy plain, 5 miles from the left bank of the Theiss, and 16 miles north-east of Szegedin. It is considered the largest *market*-town of Hungary, and indeed of Austria. Pop. 42,500, actively engaged in cattle-breeding, and in the cultivation of wine and tobacco.

VASARHELY, or MAROS-VASARHELY, a handsome town of Transylvania, the largest of what are called the Szekler towns, and the centre of Szekler political life, stands on the Maros, on a fruitful plain 60 miles north-north-east of Hermanstadt. It has broad streets and well-built houses; excellent public schools, Protestant and Catholic—the latter richly endowed; a strong castle; and a choice public library, founded by Count Tekeli, and embracing 60,000 vols., among which are a MS. Tacitus, from the library of King Matthew Corvinus. Tobacco, wine, and fruit are largely cultivated. Pop. about 11,000.—*Transylvania*, by Charles Boner (Lond. 1865).

VASARI, GIORGIO, an Italian painter and author, was born at Arezzo, in Tuscany, in 1512. He was a pupil of Michael Angelo's, and obtained the patronage of many distinguished persons, as Cardinal Ippolito de' Medici, Clement VII., and the Dukes Alessandro and Cosmo de' Medici; but his pictures possess no peculiar or distinctive merit, and his reputation rests exclusively on his *Vite de' più excellenti Pittori, Scultori, e Architetti* (Lives of the most excellent Painters, Sculptors, and Architects; Flor. 2 vols. 1550; 2d ed. by V. himself, 3 vols. 1568). This work is written, on the whole, in a simple and honest style; at times, it is even marked by a noble eloquence. The criticism is often admirable; and in spite of frequent inaccuracies (which, indeed, have been corrected by Della Valle, Rumohr, Förster, and others), it remains a model of art criticism and biography. V. died at Florence in 1574.—Bohn has published an English translation of V., in 5 vols., forming part of the 'Standard Library' series.

VASCO DA GAMA. See GAMA.

VASCULARES, in De Candolle's botanical system, the first of the two great divisions of plants, consisting of those in which Vascular Tissue (q. v.) appears, and thus including all the phanerogamous plants, both endogenous and exogenous. See CELLULARES.

VA'SCULAR TISSUE, in Botany, that kind of vegetable tissue which is composed of closed tubes or vessels, elongated cells. The tubes have membranous walls of Cellulose (q. v.), and within them are juices of the plant, which often deposit secretions. They are generally almost cylindrical—although sometimes prismatical from compression—except that they taper to a point at each extremity, preserving their character as cells by being closed at the extremities. They lie close together in bundles, and often overlie one another at the ends. The principal kinds of vascular tissue are Woody Fibre (q. v.) and Laticiferous Tissue, composed of the vessels which convey the Latex (q. v.). Laticiferous tissue is generally composed of branched and anastomosing tubes, the walls of which are thin and delicate, extremely so in young plants. Many varieties of vascular tissue have, however, been distinguished by botanists, of which the most important are those classed under the name of *Fibro-vascular Tissue*, having spiral fibres in the tubes, winding up the inside of their walls as if to strengthen them. These fibres are elastic, and the coil can often be easily unrolled, at least whilst the tubes are young. Many fibres are often found in a single tube.

VASE (Lat. *vas*, Ger. *Fass*), a term applied, in its widest signification, to all vessels adapted either for ornament or for use. It is generally used in this sense with reference to ancient art; in connection with modern art, it is restricted to vessels of an ornamental kind. Few remains of antiquity have excited more interest than vases, particularly those of Greece, and of the Greek colonies and conquests. The names given by classical writers to vessels adapted for different purposes, have not always been

easily identified with the ancient vases which have been preserved to us; but according to the nomenclature of M. Gerhard, which has generally been adopted, the following are the principal varieties, classified according to their uses: 1. Vases for holding wine, oil, or water, known under the names of *amphora* and *diota stamnos*. 2. Vases for carrying water, *hydria*, *calpis*. 3. Vases for mixing wine and water, *crater*, *kelebe*, *oxybaphon*. 4. Vases for pouring, *oinochoë*, *olpe*, *prochoüs*. 5. Drinking cups or goblets, *cantharus*, *kyathus*, *karchesion*, *holchion*, *kyphos*, *kylix*, *lepaste*, *phiale*, *keras*, *rhyton*. 6. Vases for ointments or perfumes, *lekythos*, *alabastron*, *askos*, *bomylios*, *aryballos*, *kotyliscos*.

The materials of which vases are formed include metal, stone, glass, and earthenware.

Vases of the precious metals were in use among the ancient Egyptians. Among the Greeks and Greek colonists of Asia Minor, they were very early employed for sacrificial purposes, and those of silver were frequently chased, an art in which considerable progress had been attained at a remote period. The general improvement in design in the epoch of Phidias, told in the chaser's art, the complete development of which was, however, according to Pliny, due to Polycletus. In the later period of the Roman Republic, chased silver vases were more than ever in request; but under the Empire, chasing fell into disuse. Bronze, iron, and lead were all used as materials for vases. Bronze vases abounded among the presents made to the Greek temples; they were generally thin and hammered out, often decorated with inlaid ornaments or reliefs, among which mythological subjects and animal heads appear, and the handle sometimes assumed the shape of the human figure. Leaden vases were chiefly used for unguents or perfumes. The gold and silver vases of the first few centuries of the Christian era were, for the most part, imitation of pagan art. In the 12th c., a style was introduced, called *damascene* work, with patterns of gold or silver wire embedded in iron or bronze. Many vases of this kind were made by Benvenuto Cellini.

Among the mineral materials which, plain and enriched, have been used both in ancient and modern times for vases, are marble, lapis lazuli, jasper; semi-transparent stones, such as opal, girasol, agate, chalcedony, sardonyx, cornelian; as also transparent gems and rock crystal. Multitudes of vases of precious stones were brought to Rome from the conquered provinces, particularly from Asia. Those in highest esteem were the *myrrhine* vases, whose material has been the subject of dispute among antiquaries; they are described by Pliny as brilliant, gem-like, and of various colours, generally purple and white, mingled with the iridescent hues of the rainbow. Precious stones have not ceased to be a material for vases; large and costly vases of malachite and jasper are manufactured in Russia; and elaborately carved vases are still made of the white alabaster of Volterra, in Tuscany.

Glass has at all times been a favourite material for vases. Small toilet-phials of opaque glass were in use in Egypt as far back as 1450 B.C. The cameo vases of Rome, of which the Portland vase is the most celebrated example, were composed of two layers of glass, the outer of which, being opaque, was cut down into groups of figures, delicately executed in relief. About the 3d c., we have, for the first time, the *diatreta*, or bored vases, with an external veil of network, almost detached from the rest of the glass. In the 5th c., occur vases composed of two layers of glass, with gilded subjects—often figures of Christ and legends of saints—between them. Vases of green glass, or a later period, with undercut projections, bearing a rude resemblance to the diatreta, have been found in tombs in England and France. Venice afterwards acquired great celebrity for its glass vases. In the beginning of the 16th c., the Venetian glass-makers introduced a class of vases enriched with white or coloured filigree work, having the appearance of being incrusted in the glass. They were much sought after all over Europe; and great care was taken to prevent the secret of their manufacture from being discovered. Beautifully enamelled vases were also issued from the Venetian manufactories, as well as others of grotesque forms, representing imaginary animals, and pierced with holes or constructed in the form of a siphon, which are said to have been employed by alchemists, and in pharmacy and distillation. The German manufacturers, in the 16th c., produced vases with heraldic designs and inscriptions in enamel, generally cylindrical, and sometimes of considerable size, which are much prized by connoisseurs; in the following century, the designs became more artistic; and both in Germany and Italy, it was quite usual for distinguished artists to be employed to decorate these glass vases, in imitation of rock crystal, with ornaments, arabesques, and engraved subjects.

The most prevalent material for vases of all kinds, including those intended to hold the ashes of the dead, has generally been baked clay. Multitudes of Greek sepulchral vases have, after a lapse of more than fifteen centuries, been brought to light, at a time when learned men can appreciate them, and gather from them valuable information in history and archæology. An account of the terra-cotta vases of Greece, Italy, and other countries, is given under POTTERY.

VASISHT'HA (the superlative of the Sanscrit *vasumat*, wealthy) is the name of one of the most celebrated Vedic R'ishis (q. v.), the author of several hymns of the R'igveda, and a personage who seems to have played an important part in the early history of the Brâhmanic or priestly caste of the Hindus. In the account given of him, historical events and mythological fictions are so much blended together, that it is scarcely possible to gather more from it, for certain, than that he was a sage of high reputation, and a priest jealous of the privileges and the position of his caste, and ever ready to assert its superiority over the second or military and royal caste. In one of his R'igveda hymns, he claims to have been enlightened by the god Varun'a; and in another he is called the son of *Mitra* and *Varun'a* (q. v.), born from the mind of *Urvas'î* (q. v.). In other Vedic passages, his pre-eminence over other R'ishis, and his acquaintance with sacred and sacrificial knowledge, are extolled. In the Mahâbhârata (q. v.), which also calls him the son of Mitra and Varun'a—whence his appellation there, *Maitrâvarun'i*—he is mentioned as imparting divine knowledge to King Janaka, and as the family priest of the race of Ikshwâku; and in the Purân'as he is said to have been one of the arrangers of the Vedas in the Dwâpara age. In Manu and the Purân'as (q. v.), he becomes a patriarch, one of the nine mind-born sons of the god Brâhman; and according to some, marries Urjâ (Strength); according to others, *Arundhatî*, one of the Pleiades, by whom he has seven sons. Various other legends relating to him always endeavour to impress the Hindu mind with his Brâhmanic power over kings and Kshattriyas generally. Thus, so great was his power, as the Raghuvans'a relates, that when King Dilîpa was doomed to remain childless, because he had inadvertently offended the fabulous cow Surabhi, he was released of this curse by faithfully attending on the cow of V., which was the cow of plenty and an offspring of Surabhi. But

the most interesting episode of his life is that relating to his conflict with *Vis'wâmitra* (q. v.). A Vasisht'ha is also mentioned as the author of a law-book; but whether he is, or is intended to be, the same personage as the ancient sage, may be doubtful. The name is often written *Vas'isht'ha*, when it would be the superlative of *Vas'a*, meaning 'the most humble'—which the epic and Purânic V. certainly was not—or of *Vas'in*, meaning 'the sage who has thoroughly subdued his passions'—which, too, would seem to be a rather strange epithet of the irascible saint. But though the name of the owner of the cow of plenty, who could obtain anything he desired, is doubtless correctly spelled Vasisht'ha, the less correct spelling must nevertheless have been current for a considerable time, since so early a poet as Kâlidâsa (q. v.), in his Raghuvans'a, puns on the words *vas'î vas'isht'ha*, 'Vas'ishth'a, the sage with subdued passions.'—See, for the legends concerning V., J. Muir's *Original Sanscrit Texts*, vol. i. (1858).

VA'SSAL (Celtic, *gwâs*, a youth or page), in the Feudal System, is the correllative of Suzerain (q. v.). See also SUPERIOR, FEU.

VASSILKO'V, a town of Little Russia, in the government of Kiev, and 18 miles south-west of the city of that name. This town, which was founded in the 10th c., contains 10 factories, 5 of which are employed in the manufacture of tobacco. Pop. 15,832.

VA'STO, or IL VASTO, a town on the east coast of Southern Italy, in the province of Chieti, 26 miles south-east of Ortona. It stands on a rising ground facing the Adriatic, from which it is distant 1¼ mile, is enclosed by walls, contains a spacious square with a handsome fountain, a handsome palace, a castle, and several churches. It carries on an active trade in corn, oil, and vinegar. Pop. 9437.

VASUDEVA AND VASUDEVA. See under VISHN'U.

VATE'RIA. See TALLOW TREE.

VA'TICAN, PALACE OF, in Rome, the principal residence of the pope, and the seat of the great library and the museums, and collections of art, ancient and modern, which, for visitors, constitute one of the chief attractions of the city of Rome. The popes, very soon after the establishment of the peace of the church under the Emperor Constantine, had a residence at the V., which they occupied, although at uncertain intervals, conjointly with that of the Lateran. For a long time, however, through the medieval, and especially the late medieval period, the V. appears to have been neglected. It was Nicholas V. who began that systematic scheme for the improvement and embellishment of the V. which has resulted in what, taken altogether, may be regarded as perhaps the noblest of princely residences. Alexander VI., Julius II., and above all, Leo X., pursued the same plan; and there are very few of the succeeding popes who have not had a share in the enlargement or embellishment of the Vatican. Amid all the difficulties, financial and political, of his pontificate, Pius IX. has effected many tasteful works of completion or restoration, the most striking and effective of which is the great stair by which it is approached from the colonnade of St Peter's. The building, with its gardens and other appurtenances, is said to cover a space equal to the whole area of the city of Turin, such as it was twenty years ago, with a pop. of 130,000. It is popularly believed to contain 16,000 apartments of various sizes, but this is probably an exaggeration. Some of them, however, are of unrivalled beauty, among which may be particularised the chapel of San Lorenzo, the Pauline Chapel, and the still more celebrated Sixtine Chapel, which is decorated in frescoes from the pencil of Michael Angelo; the Sala Regia, the galleries and halls decorated by Raphael, Giulio Romano, and their scholars; the magnificent library, which, although surpassed in the number of volumes, is unrivalled among the cities of Europe in extent, in beauty of proportions, and in decorations; the galleries of antiquities, Christian and pagan, and of paintings, statuary, bronzes, medals, vases, and other objects of art. Many descriptions of the V., with costly illustrations, have been published, and are to be found in all great libraries. An extremely interesting account, historical and descriptive, is to be found in Donovan's *Rome, Ancient and Modern;* and the most recent additions will be found carefully detailed in Murray's *Handbook of Rome.*

VATTEL, EMERICH, a well-known writer on the law of nations, was born at Couret, in Neufchâtel, 25th August 1714. His father, a Protestant clergyman, had been ennobled by the king of Prussia, whose subject he was. V. studied for the church at Bâle and Geneva, but he devoted greater attention to the writings of Leibnitz and Wolf than to those of the Calvinistic divines; and instead of becoming a country clergyman, he resolved to push his fortune at the court of Berlin, as a man of letters and diplomatist. In 1741, he offered his services to Frederick II., who had just ascended the throne, but there was then no vacancy in the public service. Three years afterwards, he received an appointment at Dresden from the Elector of Saxony, then also king of Poland; and in 1746, he was sent by him as minister to Bern. In this post, he had ample leisure, and devoted himself to literary pursuits. He published, in French, under different titles, collections of essays on miscellaneous subjects, which are lively, and well written. But his chief attention for ten years was bestowed on his great work, the *Droit des Gens; ou Principes de la Loi Naturelle appliqués à la Conduite et aux Affaires des Nations et des Souverains.* This title sufficiently explains the scope of the work. It contained little that was new but it abridged and systematised the doctrines of Grotius, Puffendorf, and Wolf. V. had, however, that skill in arranging his materials, and that power of lucid expression, which so often characterise French men of letters; and his book became rapidly popular as a text-book of international law. Like all his predecessors in the same field, V. based his whole system on an imaginary law of nature, and it would be easy to enumerate a large number of false conclusions to which he came in the absence of the light thrown on the law of nations by practice, and by the principle of utility in our time, so generally adopted as the test of international morality. After the completion of his great work, V. was recalled to Dresden, where he married, in 1764, Marianne de Chêne, and was promoted to the rank of privy-councillor. The duties of his new post proved too arduous, and he died of over-work on 28th December 1767. Mr Chitty republished, in 1833, an English translation of Vattel, with notes.

VAUBAN, SEBASTIEN LE PRESTRE, Marshal of France, the celebrated military engineer, was born at Saint Leger de Fougeret, in the dep. of Nievre, 15th May 1633; and being left an almost destitute orphan at the age of ten, his education was carried on under the auspices of the *curé* of his village. Leaving Saint Leger in 1651, he set out on foot to join Condé's army, then on the Belgian frontier; and during two years of active field-service, obtained

large insight into the engineering methods then in practice. Taken prisoner in 1653, he joined the royalists, and during the succeeding contest was mostly attached to the army of Turenne, who intrusted him with the sole control of the besieging operations; and the powerful assistance which the extraordinarily rapid reduction of the enemy's strongholds gave to the king's little army, gained for V. the repute of being the most promising young engineer of the time. On the conclusion of peace in 1660, he was despatched to the west to demolish the rebel strongholds in Lorraine, and to take charge of Breisach; but in 1667, he appeared again in the north, capturing one after another the powerful defences of the Belgian frontier. About this period, the all-powerful Louvois, charmed by V.'s probity, punctuality, and habits of cool calculation, no less than by his genius, took him firmly by the hand; and it was as much owing to the great minister's favour as to the superiority of his designs that V. was preferred to the highly honourable and important office of fortifying the Flemish fortresses which had fallen into the possession of France. This labour accomplished in 1672, and the war with Holland resumed, V. took his old place as director of the siege operations, and for the first time introduced into practice in Western Europe the method of approach by parallels (recently borrowed from the Turks), at the siege of Maestricht (1673), and with such effect, that that strong fortress capitulated in thirteen days. After tracing the plan of siege for Treves, and with remarkable sagacity foretelling the date when it *must* fall, he set himself with energy to strengthen the newly-acquired fortresses in the Low Countries, and closed a long and brilliant array of services for 1674 by throwing himself into Oudenarde, where William of Orange besieged him in vain. In 1675, he inaugurated a new era in military tactics by obtaining the creation of a corps of engineers, though the completion of the innovation by the establishment of companies of sappers was denied him. In 1676, he conducted the remarkable sieges of Valenciennes and Cambrai, stormed the latter in open day, against the unanimous opinion of the generals of the army; and two years later was rewarded for his long and glorious services by the appointment of director-general of fortifications. This post gave him the supreme control of the department of military engineering, and the ten years of peace which followed 1678 supplied opportunity for V.'s rendering to France perhaps the greatest of his services, in surrounding the kingdom with a complete cordon of fortresses, fitted either for defence or for commanding weak points of the neighbouring countries. At intervals during this period, he captured the almost impregnable fortress of Luxembourg, and planned and partly executed the magnificent aqueduct of Maintenon, by which the waters of the Eure are conveyed to Versailles.

War breaking out again in 1688, V. conducted the sieges of Philipsburg, Mannheim, and Frankenthal (introducing, at the last, his invention of ricochet-firing), Mons (1691), and Namur (1692), with his usual success, though opposed at the last-named place by his great rival, Cohorn, who had fortified, and who defended it. After this period, V. almost disappears from the field of warfare, on which he had stood invincible for so many years, for the sieges of Charleroi (1693), Ath (1697), Breisach (1704), and the construction of the intrenched camp near Dunkirk (1706), are the only professional works of importance during the last 14 years of his life. After the peace of Ryswick in 1697, he had applied his active practical mind to the consideration of various deficiencies and anomalies in the internal government of France; and his zeal and research brought together a large mass of information and suggestion on numerous subjects, which was published under the curious title of *Oisivetés de M. de Vauban*, and contained recommendations for the collection of statistics of population, commerce, and agriculture, for supplying the army by recruitment, and valuable suggestions for improving the soil by drainage, &c. &c. Another of his works which excited an immense sensation at the time was the *Dîme Royale* (1707), in which he discussed the question of taxation, and anticipated in the most striking manner the doctrines which, a century later, overthrew the French monarchy: such principles promulgated by a man of V.'s sterling integrity and profound practical wisdom, could not be expected to be very palatable to the king and court, of whose conduct they furnished indirectly the severest censure; and we are not therefore surprised to learn from Saint-Simon 'that the Marshal de Vauban was very ill received when he presented himself,' and that, by an edict of February 14, 1707, his book was seized and confiscated. V. did not long survive his disgrace, dying at Paris, March 30, 1707. Fontenelle calculates that he had constructed 33 new fortresses, repaired 300 old ones, conducted 53 sieges, and had been present at 140 'actions of vigour;' and in his practice, the capture of a fortress was certainly a mere question of time and powder. His various professional works on the attack and defence of places, and on mines, have been collected under the title of *Œuvres Militaires* (Paris, 1796); and besides these, we have various other Memoirs on professional subjects from his pen. Historical notices and eulogies of V. are abundant in French literature. See *Nouvelle Biographie Générale.*

VAUCLUSE, a dep. in the south-east of France, bounded on the W. by the Rhone, and on the S. by the Durance, which separates it from the dep. of Bouches du Rhone. Area, 1369 sq. m.; pop. (1872) 263,451. The Rhone is the great river, and its affluents, with the exception of the Durance, are all small. The dep. is traversed in the east by spurs of the Alps. The plains are all in the west—the chief being those of Orange, Carpentras, and Cavaillon. In the east, the mountains are separated by narrow, torrent-ploughed valleys; and the summits, the chief of which is Mont Ventoux, 6778 feet high, are arid and bare. The climate is healthy and temperate, although subject to great variations—the winds from the north and north-east being sometimes very violent. The dep., though more agricultural than manufacturing, does not produce cereals in great quantity; but the peach, pear, prune, almond, and fig trees bear excellent fruits. Olive, mulberry, and orange trees are quite common. Wines and honey, both held in high esteem, are produced. There are four arrondissements—Avignon, Apt, Carpentras, and Orange. Avignon is capital.

VAUD (Ger. *Wadt*), a canton which forms the western corner of Switzerland between the Jura and the Bernese Alps. Area, 1226 sq. m.; pop. 238,730. It is a comparatively level district, traversed, however, by an elevated tract, known as Mount Jorat, from which plains slope on either side to the Lake of Geneva on the south, and the Lake of Neufchâtel on the north. On both sides, near the mountains, there are extensive pasture-lands, but the greater part of the country is highly cultivated. The orchards and vineyards are very extensive, the latter yielding white wines of excellent quality. There are no manufactures of any importance. It is now traversed by railways,

which connect it in two directions with France, and in three with the rest of Switzerland. It forms part of French Switzerland, the dialect spoken by the inhabitants being the Vaudois. The religion is Protestant. V. has formed, since 1830, a democratic republic, each citizen 23 years of age having a vote in electing the council of the canton, which meets twice a year for about a month. V., after the fall of the Roman Empire, formed part of the Burgundian kingdom. In the 13th c., it became a dependency of Savoy, to which it was annexed in 1359. In 1476, the House of Savoy took part with the Duke of Burgundy in his struggle with the Swiss; and on his defeat, a part of V. was annexed to the adjoining cantons. In 1536, the Bernese took possession of the whole of V., which they divided into fifteen parts, administered by *baillis*, appointed at Bern. The nobility became patricians of Bern, and in this way acquired great influence. Still, the local councils had the power of appointing magistrates and administrative officers, which, to some extent, tempered the aristocratic character of the government. The French invasion put an end to the rule of Bern, and V. became a separate canton. The government remained in the hands of the higher classes until June 1830, when a new constitution, granting a vote to every adult *bourgeois* of good character, was obtained from the council, under the threats of a riotous mob, who had assembled at Lausanne. The Vaudois are industrious and well educated; and from this part of Switzerland come a large number of the Swiss teachers and governesses who are met with in all parts of the world. Capital, Lausanne (q. v.).

VAUDEVILLE, originally a popular song with words relating to some story of the day; whence it has come to signify a play in which dialogue is interspersed with songs of this description, incidentally introduced but forming an important part of the drama. The German *Liedertafel* is a somewhat similar composition.—The name Vaudeville is a corruption of Vaux de Vire, the name of two picturesque valleys in the Bocage of Normandy. One Olivier Basselin, a fuller in Vire (q. v.), composed, about the middle of the 15th c., a number of humorous and more or less satirical drinking-songs, which were very popular, and spread over France, bearing the name of their native place (Les Vaux de Vire). As the origin of the term was soon lost sight of, it at last took its present form. In the 16th c., Vauquelin still names such pieces Les Vaux de Vire.

VAUDOIS. See WALDENSES.

VAULT, an arched roof, usually constructed of stone or brick-work. The simplest kind of vault is the plain wagon or tunnel vault, being a simple segmental or semicircular arch, thrown across a longitudinal apartment, and extending from one end to the other. Ordinary bridges shew an example of this style of vaulting. Such vaults were commonly used by the Romans, who also built vaults with *groins*—i. e., vaults intersecting one another. See GROINED VAULTING. The tunnel arch, of a pointed form, was of very ancient introduction, having been used by the Assyrians for vaulting their large drains.

The Egyptians are also said to have been acquainted with vaulting; but the earliest remains of ancient vaults of any magnitude are Roman works.

The Roman vaults, where groined, are usually constructed with carefully cut stone, so as to prevent the angle from chipping. The medieval architects had not the costly materials or skill of the Romans at command, so they formed the groins only of dressed stone, and the filling in of the vault with commoner materials. This led to the groin becoming a prominent feature in medieval architecture, being generally ornamented with mouldings and carved work. We have already traced the progress of Gothic vaulting under the heads GOTHIC ARCHITECTURE, FAN-TRACERY VAULTING, RIB, &c. Domical or hemispherical vaulting was also much used by the Romans. The Pantheon, in Rome, is the finest example remaining, being a circular building with a dome 142 feet in diameter. Roman domes and vaults are frequently ornamented with sunk panels. During the Renaissance period, vaulting in great measure gave place to wooden roofs; but when employed, the domical or plain groined vaults of Roman architecture are chiefly used. In modern works, vaults and arches are gradually becoming superseded by the use of iron construction, both for roofs and for supporting floors, bridges, &c.

VAU'LTING-SHAFT, a small column, or pillar, supporting the ribs of a Gothic vault. These shafts generally occur in clusters, and may either spring from the ground, or be supported on small corbels in the wall.

VAUMURE, in old fortresses, a low work under the wall, in the nature of a *fausse-braye*.

VAUQUELIN, JEAN, a French poet, was born in 1535, of a noble family, at the château of La Fresnaye, near Falaise. He made a pretence of studying law at Poitiers, Paris, and at Bourges, but really spent his time in gaiety and verse-making. He finally became president of the *Présideal* bench at Caen, where he died in 1607. His *Œuvres Poëtiques* contain many sportive songs and other light pieces, which are yet read with pleasure. He was the first writer of idyls in French verse, and is considered as the real founder of French satire, which he redeemed from the grossness that had hitherto characterised the productions that went under that name.

VAUXHA'LL, a famous public garden in London, constituted as such immediately after the Restoration (May 1660), and supporting that character for nearly two centuries. It was situated in Lambeth, opposite Millbank, and near the manor called Fulke's Hall (the residence of Fulke de Breauté, a follower of King John), from which is derived the name Vauxhall. Pepys, writing May 28, 1667, describes the garden, and concludes that the entertainments there to be had are 'mighty devertising.' But the pastimes of V. were not always of a merely 'devertising' description. The eating, drinking, dancing, and flirtation that continually went on there, led to much quarrelling and dissipation. On the whole, V. does not appear to have been particularly strict in its morals. The loose character of the amusements it afforded is freely sketched by the dramatists and novelists of the last century, and is again revived in Thackeray's *Vanity Fair*.

VAUXHALL NECTAR, a mixture of rum and syrup, with an addition of benzoic acid, or flowers of Benjamin, in the proportion of half a dram to the quart. It was formerly in much repute as a drink, and was taken mixed with water. It was also called British arrack.

VA'VASOUR, or **VALVASSOR** (derived, like *vassal*, from Celtic *gwâs*, a youth or page), a term of feudal times, more in use in the continent of Europe than in England, employed somewhat loosely, and defined by Camden as the rank next below a baron. Its usual meaning was one who held his lands, not directly of the crown, but of

one of the higher nobility. In this class were comprehended the *châtelains*, who owned castles, or fortified houses, and possessed rights of territorial justice.

VAYGA'CH (also written *Vaigatch*, *Vaigatz*, and *Waigatz*), an island of the Arctic Ocean, belonging to Russia, stands between the mainland and the island of Nova Zembla, from the former of which it is separated by a strait about 5 miles broad. There is no resident population; but, being productive in furs and in fish, it annually attracts a number of Russian and Samoied hunters.

VÂYU (from the Sanscrit *vâ*, blow), the wind, is, in the Vedic Mythology of the Hindus, a deity, which originally seems to have held an equal rank with Indra (q. v.), but much more rarely occupies the imagination of the poets than this god, or Agni, or the sun; for though, according to Yâska (q. v.), ancient commentators of the Vedas hold that there are only three great deities—viz., *Agni*, fire, whose place is on earth; *Sûrya*, the sun, whose place is in heaven; and *Vâyu*, or *Indra* (q. v.), whose place is in the intermediate sphere—only a few hymns, comparatively speaking, are dedicated to Vâyu, whereas the other deities named are the subject of manifold praise. The description given by the R'igveda of the greatness of Vâyu nevertheless answers the position which those ancient commentators assign to him.—See J. Muir's 'Contributions to a Knowledge of the Vedic Theogony and Mythology,' in the *Journal of the Royal Asiatic Society* for 1864. In the epic and Purânic mythology, V. occupies but an inferior position, and the legends there related of him have no cosmical character. They give him a wife, *Anjanâ*, by whom he has a son, the monkey *Hanumat* (q. v.). When represented, V. either rides on an antelope with a sabre in his hand, or he is seated holding his son Hanumat in his arms.

VÂYU-PURÂN'A. See PURÂN'A.

VEDA (from the Sanscrit *vid*, know; kindred with the Latin *vid-*, Greek *id-*, Gothic *vait-*, Lithuanian *weizd-*; hence, literally, knowledge) is the technical name of those ancient Sanscrit works on which the first period of the religious belief of the Hindus is based. See INDIA, sec. *Religion*. The oldest of these works—and in all probability the oldest literary document still existing—is the *R'igveda*; next to it stand the *Yajurveda* and *Sâmaveda*; and the latest is the *Atharvaveda*. The first three also bear the collective title of *trayî*, or 'the threefold' (scil. science); and all four are considered to be of divinely inspired origin. Each of these Vedas consists of two distinct divisions—a *Sanhitâ*, or collection of *mantras*, or hymns; and a portion called *Brâhman'a*. A *mantra* (from *man*, think; hence, literally, the means by which thinking or meditation is effected) is, as Colebrooke, in conformity with the Mîmânsâ writers, defines the word, a prayer, or else a thanksgiving, praise, or adoration addressed to a deity: it declares the purpose of a pious act, or lauds or invokes the object; it asks a question, or returns an answer; either directs, inquires, or deliberates, blesses or imprecates, exults or laments, counts or narrates, &c. Sometimes it is addressed to the deity with a verb in the first person; sometimes it ends with the verb 'thou art,' or with the word 'thee.' See Colebrooke, *Miscellaneous Essays*, i. p. 308; Müller, *Ancient Sanscrit Literature*, p. 343; Jaiminîyanyâyamâlâvistara, as quoted in Goldstücker's *Pân'ini*, p. 69. If such a *mantra* is metrical, and intended for loud recitation, it is called *R'ich* (from *r'ich*, praise)—whence the name *R'igveda*, i. e., the Veda containing such praises—if it is in prose, and then it must be muttered inaudibly, it is called *Yajus* (from *yaj*, sacrifice; hence, literally, the means by which sacrificing is effected); therefore, *Yajurveda* signifies the Veda containing such *yajus*. And if it is metrical, and intended for chanting, it is termed *Sâman*; whence *Sâmaveda* means the Veda containing such sâmans (The original meaning of the latter word is obscure. Native grammarians derive it, but without much probability, from *so*, to give pain, because, they say, 'it is difficult to utter such mantras.' A mystical but grammatically impossible, account of *sâman* is given in the *S'atapatha-brâhman'a* and *Br'ihadâran'yaka*, where the word is analysed into *sâ* and *ama*, the former being interpreted as implying 'speech,' and the latter 'breathing forth,' since the chanting of the sâman, as the commentator says, is essentially the result of both.)—No special name is given to the mantras of the fourth Veda. The author of the mantra, or, as the Hindus would say, the inspired 'seer,' who received it from the deity, is termed its *R'ishi* (q. v.); and the object in which the mantra is concerned is its *devatâ*—a word which generally signifies 'deity,' but the meaning of which, in its reference to the mantras, must not always be taken literally, as there are hymns, in which not gods or deified beings, but, for instance, a sacrificial post, a remedy against bad dreams, the generosity of princes from whom gifts were received by the authors, or a chariot, a drum, weapons, the charioteer and horses employed in war, and other worldly objects, invoked, are considered as the *devatâ*.—See Colebrooke's *Misc. Essays*, i. p. 22; Wilson's *Rigveda*, vol. i., in the edition of F. E. Hall, p. 347.—*Brâhman'a*—derived from *brahman*, neuter, probably in the sense of prayer or hymn (see concerning this word, J. Muir, 'On the Relation of the Priests to the other Classes of Indian Society in the Vedic Age,' in the *Journal of the Royal Asiatic Society* for 1864; and the introduction of M. Haug's edition of the Aitareya Brâhman'a, vol. i. p. 4)—designates, according to *Mâdhava-Sâyan'a*, the great commentator on the Vedas, that portion in prose of the Vedas which contains either commandments or explanations; or, in other words, which gives injunctions for the performance of sacrificial acts, explains their origin, and the occasions on which the mantras had to be used, by adding sometimes illustrations and legends, and sometimes also mystical and philosophical speculations. The *Brâhman'a* portion of the Vedas is therefore the basis on which the Vedic ritual rests (see KALPA and VEDÂNGA), and whence the *Upanishads* (q. v.) and the philosophical doctrines (see SANSCRIT LITERATURE) took their development.

Though *Mantras* and *Brâhman'as*—both of which are also termed *S'ruti* (q. v.)—were held at a later period of Hinduism to have existed simultaneously, that is, from eternity, it is certain that the Brâhman'a portion of each Veda is posterior to at least some part of its Sanhitâ, for it refers to it; and it scarcely requires a remark that so great a bulk of works as that represented by both portions must have been the gradual result of a considerable period of time. There is, indeed, sufficient evidence to prove that various conditions of society, various phases of religious belief, and even different periods of language, are reflected by them. The difficulty, however, critically to discern these periods, is enhanced by the losses, probably considerable, which these writings suffered before they were preserved in the shape in which we now possess them. For in tradition, which records that *Vyâsa* (q. v.), after having compiled and arranged the Vedas, handed each of them to four disciples, and that these disciples taught them to their disciples, and so forth, down

to distant ages, there is so much indubitable, that Mantras and Brâhman'as had to pass through a large number of S'âkhâs, or schools, and that the discrepancies which gradually arose between these schools, both as regards the Vedic texts and the interpretation of these texts, cannot have been slight; for, apart from the conclusion yielded by a comparison of the remaining texts of some of these schools, later writers afford us an insight into the animosity which existed between these schools, and must have arisen from very material grounds. Thus, in a commentary on *Pâraskara's Gr'ihya Sûtras*, it is said: 'Vasisht'ha declares that it is wrong to follow the rules of another S'âkhâ. He says: "A wise person will certainly not perform the duties prescribed by another S'âkhâ; he that does is called a traitor to his S'âkhâ. Whosoever leaves the law of his S'âkhâ, and adopts that of another, he sinks into blind darkness, having degraded a sacred R'ishi." And in another law-book it is said: "If a man gives up his own customs, and performs others, whether out of ignorance or covetousness, he will fall, and be destroyed." And again in the *Paris'isht'a* of the *Chhandogas:* "A fool who ceases to follow his own S'âkhâ, wishing to adopt another one, his work will be in vain."'—See Müller's *Ancient Sanscrit Literature*, p. 51. That each *S'âkhâ* claimed the possession of the only true and genuine Veda, may be already inferred from passages like these. The differences between these S'âkhâs, however, did not consist—as has been believed—in their various readings of the S'ruti alone; it also consisted in considerable variations of their arrangement of the scriptures; in their additions or omissions of texts—as may be seen from still existing S'âkhâs of the Yajurveda—and, as is stated by *Madhusûdana*, and results from a commentator on Pân'ini, in their *different interpretation of the Vedic texts.* How great the number of these S'âkhâs was, may be inferred from the statement of the *Charan'avyûha*, a treatise ascribed to an ancient writer, S'aunaka; for it enumerates five S'âkhâs of the R'igveda; says that there were 86, and names 42 (or in one recension 44) of the Yajurveda; mentions twelve of the Sâmaveda, out of a thousand, which, it says, were at one time in existence, and nine of the Atharvaveda. The *Atharvan'arahasya*, a modern treatise on the Atharvaveda, while ascribing the same number of S'âkhâs to the Sâmaveda and Atharvaveda, speaks of twenty-one of the R'igveda, and a hundred of the Yajurveda. Of all these schools, however, the *R'igveda* is now extant only in one; the *Yajurveda* (both divisions, to be named hereafter, taken collectively) in three, and partially, in four; the *Sâmaveda* in perhaps two; and the *Atharvaveda* in one.

The character of the Sanhitâ or Mantra portion of the four Vedas—on which their Brâhman'a portion is based—as well as the relation in which these Sanhitâs stand to each other, is intelligible only if it is borne in mind that the ancient Hindu believed to secure the favours of his gods chiefly by the performance of sacrificial rites; that gradually these rites became complicated and manifold, and that special care, therefore, had to be taken to provide for a correct celebration of the sacrifices which had sprung up, and also to guard against the evil consequences which might result from inadvertence, or other causes beyond the sacrificer's control. The original worship seems to have been simple enough (see INDIA, sec. *Religion*)—it probably neither occupied much time, nor required the assistance of a priest. But when sacrifices were instituted which lasted from one day to eleven, nay, to a hundred days—and some works speak of sacrifices which went on for the space of one and even several years —and when the Brahmanic caste found the performance of such sacrifices to be an excellent means of establishing its sway over the other castes, and a convenient source of an easy livelihood, it was laid down as a rule that no sacrifice could be performed without one *R'itwij*, or priest; and that a great sacrifice, such as the Jyotisht'oma, Râjasûya, or other sacrifices which could only be celebrated by wealthy people or kings, required the assistance of not less than sixteen priests, besides a number of menials, who had to slay the sacrificial animals, to chant, or to perform other inferior work. These sixteen priests were then divided into four sections, each headed by one R'itwij, and containing besides him, his three purushas, or assistants. The first section consisted of the *Adhwaryu*, with his three purushas, the Pratiprasthâtr'i, Nesht'r'i, and Unnetr'i; the second, of the *Brahman*, with the three purushas, Brâhmanâchchhansin, Agnidh (or Agnidhra), and Potr'i; the third, of the *Udgâtr'i*, with the Prastotr'i, Pratihartr'i, and Subrahman'ya; and the fourth of the *Hotr'i*, whose assistants were the Maitrâvarun'a, Achchhâvâka, and Grâvastut. (In other accounts, the order of these sections varies, and in the section headed by the Brahman, the Potr'i precedes the Agnidh; see also Müller, *Ancient Sanscrit Lit.*, pp. 468, 469; where, however, by mistake, some of the assistant priests occur in the wrong sections.) The principal duties of these priests were further regulated in the following manner. The *Hotr'i* had to perform the rites relating to the R'igveda, the *Adhwaryu* those based on the Yajurveda; the *Udgâtr'i* was concerned in the rites of the Sâmaveda; and the Brahman had to possess a knowledge of all these three Vedas, and to set right any mistake that might have occurred in the performance of the ritual acts, or remedy any defect which might vitiate the efficiency of the sacrifice. He was therefore the most learned of all the priests; and the R'igveda itself, though perhaps in one of its latest portions, recognises this superiority of the priest Brahman. In the ritual works relating to the first three Vedas, no functions based on the use of the latest or the Atharvaveda are assigned to him, but in the *S'aunaka-Brâhman'a* of the *Atharvaveda*, where Prajâpati is introduced as intending to perform a Soma sacrifice, and asking the Vedas whom he should choose for his Hotr'i, Adhwaryu, Udgâtr'i, and Brahman, the Vedas answer him: 'Choose for a Hotr'i (the priest) who knows the R'igveda; for an Adwaryu, (the priest) who knows the Yajurveda; for an Udgâtr'i, (the priest) who knows the Sâmaveda; and for a Brahman (the priest) who knows the Atharvaveda;' and to explain the reason for such advice, they add that the R'igveda hymns having the earth for their abode, one who chooses a *Hotr'i* will obtain dominion over the earth; the Yajurveda mantras resting on the intermediate space, one who engages an *Adhwaryu* will obtain the world of that space; the Sâmaveda hymns dwelling on heaven, one who employs an *Udgâtr'i* will obtain that world; but one who chooses a *Brahman* will encompass the world of (the neuter) Brahman, or the supreme spirit, since the hymns of the Atharvaveda have for their abode Brahman.

The most interesting feature of this and similar passages is the tendency of their authors to maintain the greater efficiency of one of the later Vedas in comparison to that of the R'igveda, and consequently the greater practical superiority of these Vedas over the avowedly oldest Veda. And this is intelligible enough, if we compare the contents of these Vedas.

The worship alluded to in many hymns of the R'igveda must have consisted more of isolated sacrificial offerings than of a series of acts strung

together so as to form an elaborate sacrifice. There are other hymns, it is true, which betray the existence, at their time, of a ritual, already become complicated, as when three or four, or even seven priests are mentioned by the poet; but though these hymns, as well as the former, bear testimony to the existence, at that early period, of ritual acts, it does not follow that the R'igveda, as such, was composed for the purpose of being recited when they were performed. From the nature of its hymns, it results, on the contrary, that, having been composed, they were at some subsequent period connected with those pious acts which became more and more complicated, and gradually were systematised. But then even there remain verses which would not easily bend to such artificial purposes; and whole hymns, too, which would resist an attempt to force them into a liturgic code for which they were not intended by the poet's mind. A collection of songs, in short, which was the natural growth of time, and, to some extent, at least, the ingenuous outburst of the poet's feelings, became inadequate for a regular liturgy of a highly-developed and throughout artificial ritual. Out of this necessity there arose the *Sâma-* and the *Yajur-veda*. The former was entirely made up of extracts from the R'igveda, put together so as to suit the ritual of the so-called Soma sacrifices. For, as all native authorities agree in stating that the Sâma-veda contains none but R'igveda verses, the absence of 71 verses in the recension of this Veda, edited by Professor Benfey, from the recension in which the R'igveda now exists, does not disprove their unanimous statement: it must be accounted for by the circumstance, that these verses belonged to one or the other of the recensions of the R'igveda, which, as mentioned before, are no longer preserved. The origin of the Yajurveda is similar to that of the Sâmaveda; it, too, is chiefly composed of verses taken from the R'igveda; but as the sphere of the ritual for which the compilation of this Veda became necessary is wider than that of the Sâmaveda, and as the poetry of the R'igveda no longer sufficed for certain sacrifices with which this ritual had been enlarged, new mantras were added to it—the so-called Yajus, in prose, which thus became a distinctive feature of this Veda; and it is on the Yajurveda, therefore, that the orthodox Hindu looked with especial predilection, for it could better satisfy his sacrificial wants than the Sâma-, and still more, of course, than the R'igveda. 'The Yajurveda,' says *Sâyan'a*, in his introduction to the Taittirîya Sanhitâ, 'is like a wall, the two other Vedas like paintings (on it).' The sacredness of the Sâma- and Yajurveda, and the belief in their inspired character, rest on the assumption that they are of the same origin as the R'igveda, which dates from eternity, and which was 'seen' by the R'ishis who uttered it. That, in the case of the Yajurveda, this theory is only partially correct, results already from the description just given of it; for whatever losses the present text of the R'igveda may have suffered, it is admitted by all authorities that its mantras were always metrical, and that it can never, therefore, have possessed passages in prose. But how frail this theory is, and in what sense it is possible to speak of the sameness of origin even in the case of those hymns of the Sâma- and Yajurveda which are composed of R'igveda verses, a comparison of the place occupied by the verses of a few hymns taken from one and the other of these Vedas with the place which the same verses occupy in the R'igveda, will sufficiently shew.

The first hymn of the Sâmaveda consists of ten verses, nine of which are contained in the present recension of the R'igveda. If by the side of each of these verses the place is marked which it holds in the R'igveda, the result is this:

	Book.	Hymn.	Verse.
Sâmaveda 1, verse 1, is R'igveda,	6	16	10
" " 2, "	6	16	1
" " 3, "	1	12	1
" " 4, "	6	16	34
" " 5, "	8	73	1
" " 6, "	8	60	1
" " 7, "	6	16	16
" " 8, "	8	11	7
" " 9, "	6	16	13

The verses of which the hymn of the Sâmaveda 1, verses 370—380, is composed, correspond with the following verses of the R'igveda:

	Book.	Hymn.	Verse.
Sâmaveda 1, v. 370, with R'igveda,	8	86	10
" " 371, "	10	147	1
" " 372, "		absent	
" " 373, "	1	57	4
" " 374, "	3	51	1
" " 375, "	10	43	1
" " 376, "	1	51	1
" " 377, "	1	52	1
" " 378, "	6	70	1
" " 379, "	10	134	1
" " 380, "	1	101	1

If from the White Yajurveda the mantras, for instance, of the 22d to the 25th chapter were submitted to a similar test, it would be seen that in chapter 22, which has 34 divisions, only four verses occur in the R'igveda, viz.:

	Book.	Hymn.	Verse.
White Yajurveda 22, v. 10, in R'igv.	1	22	5
" " 15, "	5	14	1
" " 16, "	3	11	2
" " 18, "	9	110	3

that in chapter 23, with 65 divisions, there correspond:

	Book.	Hymn.	Verse.
White Yajurv. 23, v. 3, with R'igv.	10	121	3
" " 5, "	1	6	1
" " 6, "	1	6	2
" " 16, "	1	162	21
" " 32, "	4	39	6

that chapter 24 being in prose, cannot occur in the R'igveda; and that of chapter 25, with 47 divisions:

	Book.	Hymn.	Verse
White Yajurv. 25, v. 12, is R'igv.	10	121	4
" " 13, "	10	121	2
" " 14–23, are "	1	89	1–10
" " 24–45, "	1	162	1–22
" " 46, is "	10	157	1, 3, 2

(See the article 'The Inspired Writings of Hinduism,' in the *Westminster Review* for January 1864.)

All, therefore, that is left of the oldest Veda in the Sâmaveda and Yajurveda, is a R'igveda piecemeal; its hymns scattered about; verses of the same hymn transposed; verses from different hymns combined, and even the compositions of different poets brought into one and the same hymn, as if they belonged to the same authorship. That, under such treatment, the Yajurveda should have lost all poetical worth, is but what may be expected; it must be, however, matter of surprise that the Sâmaveda should have saved so much, as it even now possesses, of that genuine beauty which distinguishes the R'igveda poetry. The *Atharvaveda*, too, is made up in a similar manner as the Yajurveda, with this difference only, that the additions in it to the garbled extracts from the R'igveda are more considerable than those in the Yajurveda.

It is avowedly the latest Veda, and even its name, 'Atharvaveda,' as it was current already during the classical period of Sanscrit literature, does not yet occur in the oldest Upanishads (q. v.), where only the songs or revelations of the *Atharva-Angiras*, or of the *Bhr'igu-Angiras*, apparently denoting this Veda, are spoken of. The Atharvaveda was not used, as Madhusûdana, in his treatise on Sanscrit Literature says, 'for the sacrifice, but merely for appeasing evil influences, for insuring the success of sacrificial acts, for incantations, &c ;' but on this very ground, and perhaps on account of the mysteriousness which pervades its songs, it obtained, amongst certain schools, a degree of sanctity which even surpassed that of the older Vedas.

This being the general character of these four Vedas, a few remarks must here suffice to convey some idea of their special contents.

On the religious ideas expressed in the *R'igveda*, a general account is given in the article INDIA, sec. *Religion;* see also, besides the deities mentioned there, and the articles referring to them, VARUN'A, VÂYU, and YAMA, and J. Muir's 'Contributions to a Knowledge of Vedic Theogony and Mythology,' in the *Journal of the Royal Asiatic Society* for 1864. The social condition of the Hindus, as reflected from the hymns of this Veda, is not that of a pastoral or nomadic people, as is sometimes supposed, but, on the contrary, betrays an advanced stage of civilisation. Frequent allusion is made in them to towns and cities, to mighty kings, and their prodigious wealth. Besides agriculture, they mention various useful arts which were practised by the people, as the art of weaving, of melting precious metals, of fabricating cars, golden and iron mail, and golden ornaments. The employment of the needle and the use of musical instruments, are known to them. They also prove that the Hindus of that period were not only familiar with the ocean, but sometimes must have engaged in naval expeditions. They had some knowledge of medicine, and must have made some advance in astronomical computation, as mention is made of the adoption of an intercalary month, for the purpose of adjusting the solar and lunar years. Nor were they unacquainted with the vices of civilisation, for we read in these hymns of common women, of secret births, of gamblers and thieves. There is also a curious hymn, from which it would follow that even the complicated law of inheritance, which is one of the peculiarities of the existing Hindu law, was to some extent already in use at one of the periods of the R'igveda hymns. The institution of caste, however, seems at that time to have been unknown, for there is no evidence to prove that the names which at a later period were current for the distinction of caste, were employed in the same sense by the poets of these hymns.—See Wilson's *R'igveda*, vol. i., re-edited by F. E. Hall, vols. ii., iii.; and vol. iv., edited by E. B. Cowell (Lond. 1850—1866).

The only recension in which the Sanhitâ of the R'igveda has been preserved to us, is that of the *S'âkala* school; and the hymns themselves are arranged according to two methods, the one chiefly considering the material bulk, the other the authorship of the hymns. Both divisions, however, run parallel. According to the former, the whole Sanhitâ consists of eight *Asht'akas*, or eights; these, again, are divided into 64 *Adhyâyas*, or lessons; these into 2006 *Vargas*, or sections; and the Vargas into *R'ichs*, or verses, the actual number of which is 10,417, but, according to the statement of native authorities, seems at some other time to have amounted to 10,616 or 10,622.—According to the other method, the Sanhitâ is divided into ten *Man'd'alas*, or 'circles;' the Man'd'alas into 85 *Anuvâkas*, or 'sections;' these into 1017, and 11 additional, i. e., into 1028 *Sûktas*, or 'hymns,' and the hymns into *R'ichs*, or verses, the number of which coincides, of course, with that of the former arrangement. The number of *padas*, or words, in this Sanhitâ is stated as being 153,826.

In eight out of the ten Man'd'alas, the first hymn or hymns are addressed to *Agni;* the next hymn or hymns generally to *Indra;* and after these come hymns to the *Vis'we Devâs*—the deities collectively—or hymns to other special deities. The eighth Man'd'ala begins with hymns to Indra, and the ninth is chiefly devoted to Soma.

As for the authorship of the hymns, the second Man'd'ala belongs chiefly to that of *Gr'itsamada*, the third chiefly to that of *Vis'wâmitra*, and the fourth chiefly to that of *Vâmadeva*. The fifth was composed chiefly by *Atri* and members of his family; the sixth by *Bharadvâja* and members of his family; the seventh by *Vasisht'ha* and his kin; the first, eighth, ninth, and tenth by various R'ishis.—The text of the Sanhitâ has been edited in Roman characters by Professor Th. Aufrecht (Berlin, 1861); and the text, with the commentary of Sâyan'a, is in course of publication by Professor Max Müller, there having already appeared vols. i.—iv. of this edition (Lond. 1849—1862). Of translations, that by the late Professor H. H. Wilson, which was left by him completed in manuscript, and of which 4 vols. have already appeared in print (see above), follows the commentary of Sâyan'a, based on Hindu tradition; that begun by Professor Benfey in the Journal *Orient und Occident*, vols. i. and ii. (Gött. 1862—1864), is essentially speculative.

The Brâhman'a portion of the R'igveda is preserved in two works only—the *Aitareya Brâhman'a*, which consists of eight *Panchikâs*, or 'pentades,' each of these comprising five *Adhyâyas*, or 'lessons,' and all the Adhyâyas together, 285 *Khan'd'as*, or 'portions;' and the *S'ânkhâyana*, or *Kanshîtaki-Brâhman'a*, containing thirty *Adhyâyas*, also subdivided into a number of *Khan'd'as*. The following specimens, selected from the former, may illustrate the manner in which works of this category enjoin sacrificial rites and explain their secret meaning. The first relates to the ceremony of carrying the Soma (q. v.). 'The king Soma lived among the Gandharvas. The gods and R'ishis deliberated as to how the king might be induced to return to them. *Vâch*, the goddess of speech, said: "The Gandharvas lust after women. I (therefore) shall transform myself into a woman, and then you sell me to them (in exchange for Soma)." The gods answered: "No! how may we live without thee?" She said: "Sell me unto them; if you should want me, I shall return to you." Thus they did. In the disguise of a big naked woman, she was sold (by the gods to the Gandharvas) in exchange for Soma. In imitation (of this precedent), men drive away an immaculate cow of one year's age, this being the price at which they purchase the king Soma. This cow may, however, be rebought; for *Vâch* returned to the gods. Hence the Mantras, after Soma has been bought, are to be repeated with a low voice. After Soma has been bought, the goddess of speech is with the Gandharvas; but she returns as soon as the ceremony of carrying the sacred fire is performed.'

The following are the speculations of this Brâhman'a on the *Yûpa*, or sacrifical post, and the meaning of the sacrificial animal.

'(The theologians) argue the question: Is the *Yûpa* to remain standing (before the fire); or is it to be thrown (into the fire)? (They answer:) For him who desires cattle, it may remain standing.

(About this, the following legend is reported.) Once upon a time, cattle did not stand still to be taken by the gods for food. After having run away, the cattle stood still, and, turning towards the gods, said repeatedly: "You shall not obtain us. No, no!" Thereupon the gods saw that *Yûpa*-weapon which they erected. Thus they frightened the animals, which then returned to them. That is the reason that, up to this day, the sacrificial animals are turned towards the *Yûpa* (their head being bent towards the sacrificial post to which they are tied). Then they stood still to be taken by the gods for their food . . . . The man who is initiated (into the sacrificial mysteries) offers himself to all deities. Agni represents all deities, and Soma represents all deities. When the sacrificer offers the animal to Agni and Soma, he releases himself from being offered to all deities. Some say: "The animal to be offered to Agni and Soma must be of two colours, because it belongs to two deities." But this precept should not be attended to. A fat animal is to be sacrificed, because animals (compared to the sacrificer) are fat, and he (compared to them) is lean. When the animal is fat, the sacrificer thrives through its marrow. Some say: "Do not eat of the animal offered to Agni and Soma. Who eats of this animal, eats human flesh, because the sacrificer releases himself (from being sacrificed) by means of the animal." But this precept, too, should not be attended to. The animal offered to Agni and Soma was an offering to Indra, for Indra slew Vr'itra through Agni and Soma. Both then said to him: "Thou hast slain Vr'itra through us; let us choose a boon from thee." "Choose yourselves," answered he. But they chose this boon from him; and thus they receive (now as their food) the animal which is sacrificed the day previous to the Soma feast. This is their everlasting portion chosen by them; hence one ought to take pieces of it, and eat them.'—See M. Haug's edition and translation of the *Aitareya Brâhman'a* (vol. ii. pp. 59, 78), vols. i., ii. (Bombay, 1863).

The principal object for which the *Sâmaveda* was compiled is the performance of those sacrifices of which the juice of the Soma plant is the chief ingredient; and of such sacrifices the most important is the *Jyotisht'oma*, which consists of seven stages: the Agnisht'oma, Atyagnisht'oma, Ukthya, Shod'as'in, Atirâtra, Aptoryâma, and Vâjapeya; but the performance of the Agnisht'oma alone was considered obligatory for those who wished to derive the chief advantage accruing from the celebration of this grand ceremony; while its other six stages, though adding to the merits of the sacrificer, were deemed voluntary. At the performance of such Soma sacrifices, the verses of the Sâmaveda were intoned; and there are special song-books which teach the proper manner how to chant them. The Sanhitâ of the Sâmaveda is preserved in two recensions: in that of the *Rân'âyanîya*, and probably also the *Kauthuma* school. It consists of two parts: the first, the *Chhandograntha*, also called *Ârchika*, or *Pûrvârchika*, contains, in the present recension, 585 verses, which are arranged into 59 *Das'ati* or decades, these being divided into *Prapât'hakas*, or chapters, and the latter, again, into *Ardhaprapât'hakas*, or half-chapters. The second portion, called *Staubhika*, or *Uttarâgrantha*, or *Uttarârchika*, consists of 1225 verses, distributed over nine *Prapât'hakas*, which, too, are subdivided into *Ardhaprapât'hakas*. And there is this peculiarity in the Uttarâgrantha, that being for the most part arranged according to triplets of verses, the first verse of these triplets is frequently one which also occurs in the Ârchika portion. It is then called the *Yoni*, or parent verse, because the subsequent two, the *Uttarâ*, are symbolically its children, since they participate of all the modulations, stoppages, and other modifications which may occur in the chanting of the 'parent' verse. These modulations, &c. are taught in the *Gânas*, or song-books mentioned before, two of which, the *Veyagâna* and *Âran'yagâna*, relate to the Ârchika; and two others, the *Ûhagâna* and *Ûhyagâna*, to the Staubhika part. The text of the Sâmaveda-Sanhitâ, in the Rân'âyanîya recension, has been edited and translated by Dr J. Stevenson (Lond. 1842—1843), and by Professor Th. Benfey (Leip. 1848).

The number of *Brâhman'as* relating to this Veda is, by the native authorities, given as eight; and their names are: the *Praud'ha-*, or *Panchavins'a-*, the *Shad'vins'a-*, the *Sâmavidhi-*, or *Sâmavidhâna-*, the *Ârsheya-*, the *Devatâdhyâya-*, the *Vans'a-*, the *Sanhitopanishad-Brâhman'a*; and the *Upanishad*, which probably is the *Chhândogya-Upanishad*, and thus is ranked amongst the Brâhman'as. A later Brâhman'a, probably of modern date, and which is not mentioned by Sâyan'a, is the *Adbhuta-Brâhman'a*. The latter and the *Van'sa Brâhmana* have been edited by Professor A. Weber; the former in the *Indische Studien*, vol. iv. (Berlin, 1858); the latter in the *Abhandlungen der königlichen Akademie der Wissenschaften zu Berlin* (1858).

The history of the Yajurveda differs in so far from that of the other Vedas, as it is marked by a dissension between its own schools far more important than the differences which separated the schools of each other Veda. It is known by the distinction between a Yajurveda, called the *Black-*, and another, called the *White-Yajurveda*. Tradition, especially that of the Purân'as, records a legend to account for it. *Vais'ampâyana*, it says, the disciple of Vyâsa, who had received from him the Yajurveda, once having committed an offence, desired his disciples to assist him in the performing of some expiatory act. One of these, however, *Yâjnavalkya*, proposed that he should alone perform the whole rite; upon which, Vais'ampâyana, enraged at what he considered to be the arrogance of Yâjnavalkya, uttered a curse on him, the effect of which was, that Yâjnavalkya disgorged all the Yajus texts he had learned from Vais'ampâyana. The other disciples, having meanwhile been transformed into partridges (*tittiri*), picked up these tainted texts, and retained them. Hence these texts are called *Taittiriyas*. But Yâjnavalkya, desirous of obtaining other Yajus texts, devoutly prayed to the Sun, and had granted to him his wish—'to possess such texts as were not known to his teacher.' And because the Sun on that occasion appeared to Yâjnavalkya in the shape of a horse (*vâja*), those who studied these texts were called *Vâjins*. That part of this legend was invented merely to account for the name of the *Taittirîyas*, after whom a Sanhitâ and Brâhman'a of the Black Yajurveda, and for that of the *Vâjasaneyins*, after whom the Sanhitâ of the White Yajurveda is named, is clear enough. Nor is greater faith to be placed on it when it implies that the origin of this dissension ascended to the very oldest period of the Yajurveda; for there is strong reason to assume that the division took place even after the time of the grammarian Pân'ini (q. v.). See Goldstücker's *Pân'ini*, p. 130, ff. But so much in it is consistent with truth—that the Black Yajurveda is the older of the two; that the White Yajurveda contains texts which are not in the Black; and that, compared to the motley character of the former, it looks 'white,' or orderly. This motley character of the Black Yajurveda, however, arises from the circumstance, that the distinction between a Mantra and Brâhma'na portion is not so clearly established in it as in the other Vedas; hymns and matter properly

belonging to the Brâhman'as there being intermixed. This defect is remedied in the White Yajurveda; and it points, therefore, to a period when the material of the old Yajus was brought into a system consonant with prevalent theories, literary and ritual.

The contents of both divisions of the Yajurveda are similar in many respects. Two of the principal sacrifices of which they treat are the *Dars'apûrn'amâsa*, or the sacrifice to be performed at new and full moon, and the *As'wamedha*, or the horse-sacrifice, at the performance of which 609 animals of various descriptions, domestic and wild, were tied to 21 sacrificial posts. A *Purushamedha*, or man-sacrifice, unknown to the other Vedas, is also mentioned in it; its character, however, is symbolical.

The text of the Black Yajurveda is extant in the recension of two schools—that of *Apastamba*, to which the *Taittirîya Sanhitâ* belongs, and that of *Charaka*. The former, which is in course of publication—the first volume and part of the second having been already published, with the commentary of Mâdhavâchârya (Sâyan'a), by Dr E. Roer and E. B. Cowell in the *Bibliotheca Indica* (Calcutta, 1860—1864)—consists of seven *Kân'd'a*, or books, which comprise 44 *Prapât'haka*, or chapters, subdivided into 651 *Anuvâka*, or sections, and containing 2198 *Kan'd'ikâs*, or portions.

The *Vâjasaneyi-Sanhitâ*, or the Sanhitâ of the White Yajurveda, exists in the recension of the *Mâdhyandina* and *Kân'va* school. In the former—the text of which, apparently also with the commentary of *Mahîdhara*, has been edited by Professor A. Weber (Berlin, 1852)—this Sanhitâ has 40 *Adhyâyas*, or books, subdivided into 303 *Anuvâkas*, with 1975 *Kan'd'ikâs*.

The principal Brâhman'a of the Black Yajurveda is the *Taittirîya-Brâhman'a*, which, with the commentary of (Mâdhava) Sâyan'a, is in the course of publication by Baboo Rajendralâla Mitra—the first volume and part of the second having already appeared in print (Calcutta, 1860—1865) in the *Bibliotheca Indica*. That of the White Yajurveda is the *S'atapatha-Brâhman'a*, the most complete and systematic of all Brâhman'as. Its text, with a semblance of the commentary of *Sâyan'a*, has been edited by Professor A. Weber (Berlin, 1855).

The Atharvaveda has no circle of sacrifices assigned to it. Its object is, as observed before, to teach how to appease, to bless, to curse, &c. 'The most prominent characteristic feature of this Veda,' Professor Whitney, one of its editors, remarks, 'is the multitude of incantations which it contains; these are pronounced either by the person who is himself to be benefited, or, more often, by the sorcerer for him, and are directed to the procuring of the greatest variety of desirable ends. Most frequently, perhaps, long life, or recovery from grievous sickness, is the object sought; then a talisman, such as a necklace, is sometimes given, or, in very numerous cases, some plant endowed with marvellous virtues is to be the immediate external means of the cure; further, the attainment of wealth or power is aimed at, the downfall of enemies, increase in love or in play, the removal of petty pests, and so on, even down to the growth of hair on a bald pate.'—*Journal of the American Oriental Society*, vol. iii. p. 308. It has been surmised (Müller's *Ancient Sanscrit Literature*, p. 447, ff.) that the hymns of the Atharvaveda 'formed an additional part of the sacrifice from a very early time, and that they were chiefly intended to counteract the influence of any untoward event that might happen during the sacrifice.' This is possible; but the great importance which the adherents of this Veda themselves attach to it, is founded on other considerations than these. They argue, as appears from the treatise *Atharvan'arahasya*, mentioned above, that the three other Vedas enable a man to fulfil the *dharma*, or religious law but that the Atharva helps him to attain *moksha*, or eternal bliss. This doctrine is laid down, for instance, in the *Chûlika Upanishad* of this Veda, when it says: 'Those Brâhmans and others who know the science of the (neuter) Brâhman contained in the *Brahmaveda*, become merged in Brâhman;' and it is likewise inferred from other passages in the *S'aunaka Brâhman'a*. The name of *Brahmaveda* itself, by which this Veda is also frequently called, is therefore explained by them, not as implying the Veda which belongs to the province of the priest Brahman, but the Veda which contains the mysterious doctrine of Brahman, the supreme spirit, into which the human soul becomes finally absorbed. It is probable, therefore, that the very uselessness of the Atharvaveda for sacrificial purposes, and the reluctance which was felt to base its sanctity merely on its incantations and spells, invested it, in the mind of its followers, with a spiritual character, which was then fully developed in the numerous Upanishads (q. v.) now connected with it.

The text of the Atharvaveda is preserved only in the *S'aunaka* school. Its Sanhitâ consists, in the present edition of it, of 20 *Kân'd'as*, or books. Of these, the first 18 are subdivided into 34 *Prapât'hakas*, or chapters, with, altogether, 94 *Anuvâkas*, or sections, each containing a number of *mantras* (the 17th Kân'd'a consisting of a single Prapât'haka). The 19th Kân'd'a is not divided into Prapât'hakas, but into *Anuvâkas*, of which it contains seven; and the 20th, likewise divided into *Anuvâkas*, has nine, of which the third is subdivided into three *Paryâyas*.—The text of this Sanhitâ has been edited by Professors R. Roth and W. D. Whitney (Berlin, 1856).

The only existing Brâhman'a of this Veda is the *S'aunaka-* or *Gopatha-Brâhman'a*. 'That this Brâhman'a,' Professor Müller observes, 'was composed after the schism of the Charakas and Vâjasaneyins, and after the completion of the Vâjasaneyi-Sanhitâ, may be gathered from the fact, that where the first lines of the other Vedas are quoted in the Gopatha, the first line of the Yajurveda is taken from the Vâjasaneyins, and not from the Taittirîyas.'—*Ancient Sanscrit Lit.*, p. 452. Each of these Vedas received in time *Anukraman'îs*, or indices, which give the first word of each hymn, the number of verses, the names of the deities, the name and family of the poets, and the metre of every verse. The principal treatise of this kind is the *Sarvânukraman'î*, or 'The General Index,' ascribed to the authorship of *S'aunaka*. For the theosophical works which grew out of these Vedas, see the article UPANISHAD; and for the works which were composed in order to secure a correct reading and understanding of the Vedic texts, and a correct performing of sacrificial acts, see the article VEDÂNGA.—At a later period the name of Veda was also bestowed on *Itihâsas*—legends or legendary works—and *Purân'as* (q. v.), collectively; but in this sense it never obtained real currency. *Upavedas*, or minor Vedas, are also mentioned in the *Charan'avyûha* and other works, and explained by them in the following manner. The Upaveda of the R'igveda, they say, is the *Âyurveda*, or the Veda on medicine—probably the well-known works of Charaka and Sus'ruta; the Upaveda of the Yajurveda is the *Dhanurveda*, or the Veda on archery; the Upaveda of the Sâmaveda is the *Gândharvaveda*, on music; and the Upaveda of the Atharvaveda is the *S'ilpas'âstra*, a work on mechanical arts, or, according to others, the *Arthas'âstras*, works on practical subjects, comprising polity

mechanical science, the training of elephants and horses, and fencing.

In the preceding brief outline of the four Vedas, the question as to the date at which they were composed has not been raised, because, in the present condition of Vedic philology, an answer to it could only be hypothetical. From astronomical facts, based on a statement in a Vaidik calendar, Colebrooke concluded that this calendar was written in the 14th c. before the Christian era (*Miscell. Essays*, vol. i. pp. 109, 110); and though subsequent writers have questioned the full correctness of this conclusion, those most reliable nevertheless admit that the error, if any, could not lessen the antiquity of this calendar by more than 100 or 200 years. As this calendar must have been composed after the R'igveda had been arranged, and as such an arrangement itself must be posterior to the date of its last hymn, a full scope is left for imagination to fill up these intervals. But let it be understood that imagination alone would have to perform this task, since scientific research has as yet not yielded any means to check it, or prompt it on, as the case may be; nor is there any real prospect that future discoveries in Sanscrit literature will supply this want. A safer basis, however, may be looked for, if future research restricted itself to the question as to the *relative* age of these Vedic writings. Much valuable evidence has been already brought forward in this respect to prove that there are R'ishis ancient, and less ancient (see, for instance, J. Muir's *Original Sanscrit Texts*, vol. ii. p. 205, ff.); that there are R'igveda hymns older than others (for instance, in Müller's *Ancient Sanscrit Literature*); but, on the other hand, much confusion has also been produced by starting a theory, that all the Brâhman'as belong to one period, and all the hymns to another period preceding it, of which, again, two stages were thought to be discernible, and by assigning dates to the Brâhman'a period, as well as to each of the two stages of the Mantra period. For, apart from the purely imaginary value of such dates, and apart from the circumstance, that no evidence whatever has as yet been brought forward to justify an assumption of only two stages of hymns, each of which would comprise only 200 years, it is clear that the similarity of subject-matter alone—such as it marks the literary character of the Brâhman'as —cannot be a criterion for determining that *all* the Brâhman'as must be more recent than *all* the Sanhitâs. That a Brâhman'a of the R'igveda must be posterior to those hymns of the R'igveda Sanhitâ which it mentions, but to those alone—again, that a Brâhman'a of the Sâmaveda must be younger than the hymns of the Sâmaveda on which it relies, and so on—cannot be matter of doubt; but as the Sanhitâ of the Sâmaveda, for instance, must be more recent than that of the R'igveda, and as no act whatever has been adduced to shew why the Aitareya Brâhman'a, or other Brâhman'as of the R'igveda, could not have appeared before a Sâmaveda-Sanhitâ was made, and so forth in the case of the other Vedas, it follows that it would be entirely unsafe to infer that all the Brâhman'as must be more recent than all the Sanhitâs; nay, even that all the Brâhman'as must be later than all the hymns of the R'igveda, since not all of them need have existed before the oldest Brâhman'a of this Veda was composed. A result like this is, unhappily, purely negative, but it may have the advantage of counselling caution and stimulating research.

VEDÂNGA—from Veda (q. v.) and *anga*, limb; hence, literally, 'the limb of (the body of) the Veda'—is the name of six Sanscrit works, the object of which is to teach how to read and understand correctly the Vedic texts, and how to apply them correctly to sacrificial purposes. Whether the number of these works was originally the same as it now is, and already was at the time of the Upanishads, may be doubtful. Tradition mentions the following Vedângas: 1. *S'ikshâ*, or the science of proper pronunciation. It is represented by a short treatise of 35, or, in another recension, of 59 verses, which explains the nature of letters, accent, and pronunciation, and is ascribed to *Pân'ini* (q. v.). 2. *Chhandas*, or (a work on) metre, which is ascribed to *Pingala*. 3. *Vyâkaran'a*, or grammar, by which native authorities understand the celebrated work of *Pân'ini* (q. v.); but never those short books, especially concerned in Vedic peculiarities, called *Prâtis'âkhyas*, the existing representatives of which, in all probability, are posterior to Pân'ini (see Goldstücker's *Pân'ini*, &c., p. 183, ff.). 4. *Nirukta* (q. v.). 5. *Jyotisha*, or astronomy. 'Its chief object is to convey such knowledge of the heavenly bodies as is necessary for fixing the days and hours of the Vedic sacrifices.' 6. *Kalpa*, or works on the Vedic ceremonial, which systematise the ritual taught by the Brâhman'a portion of the Veda, omitting, however, all legendary or mystical detail. They are composed in the Sûtra style. See SÛTRA. The Kalpa, or 'Sranta, Sûtras belonging to the R'igveda are the *As'walâyana-*, *Sânkhâyana*, and *S'aunaka Sûtras;* those relating to the Sâmaveda, the *Mas'aka-*, *Lâtyâyana-*, and *Drâhyâyan'a* Sûtras; those of the Black Yajurveda, the *Apastamba-*, *Baudhâyana-*, *Satyâshâd'ha-*, *Hiran'yakes'in-*, *Mânava-*, *Bhâradvâja-*, *Vâdhûna-*, *Vaikhânasa-*, *Laugâkshi-*, *Maitra-*, *Kat'ha-*, and *Vârâha* Sûtras. The White Yajurveda has only one Kalpa, or 'Sranta, Sûtra connected with it, the *Kâtyâyana* Sûtra, and the Atharvaveda likewise only one, the *Kus'ika Sûtra.*—At a later period, these works were supplemented by a similar class of works, which, however, merely describe the domestic ceremonies, viz., 'the marriage rite, the rites to be performed at the conception of a child, at various periods before his birth, at the time of his birth, the ceremony of naming the child, of carrying him out to see the sun, of feeding him, of cutting his hair, and lastly, of investing him as a student, and handing him to a guru, under whose care he is to study the sacred writings.' Works of this kind are called *Gr'ihya-Sûtras* (from *gr'iha*, house), and to these, again, were added the *Sâmayâchârika-Sûtras* (from *samayâchâra*, conventional practice), which treat of customs sanctioned by the practice of pious men, but not enjoined or expressly stated in the Gr'ihya-Sûtras. The two last classes of Sûtras, which are not comprised amongst the Kalpa works, then grew into the *Dharma-s'âstras*, or law-books, of which that of *Manu* is the chief representative. See Müller's *Ancient Sanscrit Literature*, p. 108, ff.

VEDÂNTA (from the Sanscrit *veda*, and *anta*, end; hence, literally, 'the end or ultimate aim of the Vedas') is the second great division of the *Mîmânsâ* (q. v.) school of Hindu philosophy. It is chiefly concerned in the investigation of *Brahman* (neuter), or the Supreme Spirit, and the relation in which the universe, and especially the human soul, stands to it; and in contradistinction from the *Pûrvamimânsa*, or the investigation (*mîmânsâ*) of the former (*pûrva*) part of the Vedas—viz., the Sanhitâ, and especially the *Brâhman'as* (see VEDA)—which contain the *dharma*, or religious law (see MÎMÂNSÂ), it is also called *Uttara-mîmânsâ*, or the investigation (*mîmânsâ*) of the latter (*uttara*) part of the Vedas—viz., *Âran'yakas* and *Upanishads* (q. v.), which treat of (the neuter) *Brahman*, or the Supreme Spirit [not to be confounded with (the masculine) *Brahman*, or the god of the mythological *Trimûrti* (q. v.)]. Some

times, the name given to it is *S'ârîraka-mîmânsâ*, or the investigation of the soul (s'ârîraka). In its method, the Vedânta differs from the Nyâya (see NYAYA and VAIS'ESHIKA) by endeavouring to explain the universe as a successive development from one ultimate source or principle—whereas the Nyâya, in both its divisions, treats of the objects of human knowledge of which the universe is composed, under different topics, unconcerned about their mutual relation of effect and cause; and from the *Sânkhya* (see SANKHYA and YOGA), it is distinct, inasmuch as that system is based on the assumption of a duality of principles whence the universe derives its origin.

The object-matter of the Vedânta is the proof that the universe emanates in a successive development from a Supreme Spirit or soul, which is called *Brahman*, or *paramâtman;* that the human soul is therefore identical in origin with Brahman; that the worldly existence of the human soul is merely the result of its ignorance of this sameness between itself and the Supreme Spirit; and that its final liberation or freedom from Transmigration (q. v.) is attained by a removal of this ignorance, that is, by a proper understanding of the truth of the Vedânta doctrine.

According to this doctrine, *Brahman* (neuter) is both the efficient and material cause of the world, creator and creation, doer and deed. It is one, self-existent, supreme, as truth, wisdom, intelligence, and happiness; devoid of the three qualities, in the sense in which created beings possess them; and at the consummation of all things, the whole universe is resolved or absorbed into it. From Brahman individual souls emanate, as innumerable sparks issue from a blazing fire. The soul, therefore, is neither born, nor does it die; it is of divine substance, and as such, infinite, immortal, intelligent, sentient, true. Its separate existence, as distinct from Brahman, is the cause of its ignorance; and this ignorance, which consists in regarding the world as a reality capable of subsisting without Brahman, has a double power—that of enveloping and projecting. By means of the former, it makes the soul liable to mundane vicissitudes, as to the sensations of pleasure, pain, &c. The projective power of ignorance, when encompassing the soul in its fourth condition, or that of pure intellect (its other conditions are: waking, dreaming, and dreamless sleep) produces out of the darkness which then prevails the five subtile elements—viz., *ether*, which is the substratum of the quality sound; *air*, which arises from ether, the substratum of touch; from air, *fire or light*, the substratum of colour; from light, *water*, the substratum of savour; and from water, *earth*, the substratum of smell. From these subtile elements are then produced seventeen subtile bodies and the five gross elements. The former, also called *linga-s'arîra*, because they are bodies (*s'arîra*) which impart to existing beings their individual character (*linga*), are *the five organs of perception*—viz., the organs of hearing, touch, sight, taste, and smell, which arise severally from the *pure* or inactive particles of each of the subtile elements; further, *two intellectual organs*, which are produced from the *mingled pure*, or inactive particles of the subtile elements—viz., *buddhi*, understanding, the function of which is to arrive at a certainty or conclusion, and *manas* (an organ of volition and imagination), the function of which consists in willing and doubting—thinking and referring the external objects to one's own self, being two functions common to both of them; lastly, *the five organs of action*—viz., the voice, the hands, the feet, the organ of excretion and that of generation, which are severally produced from the *foul* or *active* particles of each of the subtile elements; and *the five vital airs*, which are produced from the *mingled foul* or *active* particles of the subtile elements—viz., the air breathed forth, which has its place in the fore-part of the nose; the air breathed downwards, which has its place in the lower intestines; the air which circulates through the whole body; the ascending air, which has its place in the throat, and the descending air in the middle of the body, which causes assimilation and digestion of food, produces semen, excrements, &c. (Later Vedântists assume ten such vital airs—viz., besides the foregoing, the airs which severally cause retching, winking, hunger, yawning, and fattening.) The five *gross elements* are the five subtile elements, when, according to a theory derived from a scriptural text, they have become so divided and combined that each of them retains a preponderating portion of itself, and consequently of the quality of which it is the substratum—as ether of sound, &c.—and besides smaller portions of the other subtile elements, and the qualities of which they are the substrata. From these gross elements then arise the various (mythological) worlds, and this world too, with bodies which are distinguished as viviparous, or those produced from a womb, as men, beasts, &c.; oviparous, or those produced from an egg, as birds, snakes, &c.; those generated by 'sweat' or hot moisture, as lice, gnats, &c.; and those germinating, as creepers, trees, &c. The soul, when existing in the body, is encased in a succession of 'sheaths.' The first or interior 'sheath' consists of *buddhi*, associated with the organs of perception; the second, of *manas*, associated with the organs of action; and the third, of the vital airs together with the organs of action. These three 'sheaths' constitute the subtile body of the soul, which attends the soul in its transmigrations; and the collective totality of such subtile bodies is the Supreme soul, as regarded in its relation to the world; when it is also called 'the soul which is the thread,' or passes like the thread through the universe, or Hiran'yagarbha, or life. The fourth and exterior 'sheath' of the soul is composed of the gross elements; and the collective aggregate of such gross bodies is the gross body of the deity. This whole development being the result of ignorance, the soul frees itself from its error by understanding that the different stages in which this development appears, do not represent real or absolute truth; and when its error has completely vanished, it ceases to be re-born, and becomes re-united with Brahman, whence it emanated. But since the means of arriving at a final deliverance can only be the complete mastery of the truths of the Vedânta, other means, such as the performance of sacrifices or other religious acts enjoined by the Vedas (q. v.), or the practice of Yoga (q. v.), cannot lead to the same result. They may be meritorious, and are even recommended as such, but can effect only an apparent liberation. Of this, there are two kinds: one liberation which is effected in lifetime, and enables a man to perform supernatural actions or wonders, as the evocation of the shades of progenitors, going anywhere at will, and similar feats; and another which takes place after death, and enables the soul, not divested of its subtile body, to reside in heaven; but after a time its effect ceases, and the soul has to renew its mundane existence. In order to fit the mind for meditating on these truths, various moral duties are enjoined, and various practices are recommended, especially by later Vedânta writers. Thus, the student of the Vedânta is told not to hurt a sentient being, to speak the truth, not to steal, to practise continence, and not to accept gifts; to remain pure and content, to do penance, and to study the Vedas; also to remain in certain postures, to practise various modes of suppressing his breath, and the like. These injunctions,

however, are extraneous to the doctrine itself, and appear to be a compromise with the old orthodox faith, which requires the performance of religious acts, and a later stage of it, which favours such austere practices as are especially known by the name of Yoga (q. v.). The doctrine of *bhakti*, or faith, does not belong to the older Vedânta; it is, however, an interesting feature of the later periods of this philosophy; and the same observation applies to the doctrine of *Mâyâ*, or illusion, according to which the world has no reality whatever, but is merely the product of imagination; for the older Vedânta, as will have been seen, merely teaches that the world is not *the truth*, but does not deny its material reality.

The oldest work on this philosophy is attributed to *Bâdarâyan'a*, or *Vyâsa* (q. v.), and is written in the Sûtra (q. v.) style; it is called the *Brahma-Sûtra;* it consists of four *adhyâyas*, or lectures, each subdivided into four *pâdas*, or chapters; each pâda containing a number of Sûtras. The number of the latter is 558, and that of the *adhikaran'as* or topics treated in them 191. The most important commentary on this work is the *S'ârîrakamîmânsâ-bhâshya*, by *S'ankarâchârya* (q. v.); and this commentary, again, has been commented on by a great variety of writers. The text of the Sûtras and this commentary have been edited at Calc. 1818; and the text with this commentary, and a gloss on the latter, by Govindânanda, in the *Bibliotheca Indica*, by Pandita Râma Nârâyan'a Vidyâratna, Calc. 1863. Of the great number of other commentaries on the Brahma-Sûtras, mention may be made only of that by *Râmânuja* (q. v., under VAISHN'AVAS), and of a short but very lucid one, by *Anûpanârâyan'as'iroman'ibhat't'a* (edited at Calc., without date). Amongst elementary treatises on the Vedânta, the most popular is the *Vedântasâra*, by *Sadânanda*, which, with the commentary of *Râmakr'ishn'a Tîrtha*, has been edited at Calc. 1829, and with this and another commentary by *Nr'isinhasaraswatî*, at Calc. 1849. It has been edited and translated also by the late Dr J. R. Ballantyne (*A Lecture on the Vedânta, embracing the Text of the Vedânta Sâra*, Allahabad, 1850), who also translated the beginning of the Brahma-Sûtras.—A very useful compendium of the *Adhikaran'as*, or topics, is the *Adhikaran'amâlâ*, by *Bhâratîtîrtha*, which, with the commentary of *S'rî Ânandachandra-Vedântavâgîs'a*, has been edited, Calc. 1862, and as an appendix to the Brahma-Sûtras, with extracts from this commentary, in the *Bibliotheca Indica*, 1863.

VEDETTES are mounted sentinels, placed about 100 yards in advance of the outposts of an army, to keep a strict watch upon the enemy's movements, and to signal immediately the approach of danger. They should be placed two together.

VEER, in Sailing, is to pass from one board to the other, by bringing the stern to windward. It is therefore the same action as *Gybing* (q. v.).

VEGA, GARCILASO DE LA. See GARCILASO.

VEGA-CARPIO, LOPE FELIX DE, a celebrated Spanish poet, was born at Madrid on the 25th November 1562. From his very infancy, he is said to have given promise of extraordinary talent. Like Pope, he 'lisped in numbers.' On the death of his father, the family, originally a good one, fell into great difficulties, and was broken up. The young Lope fell to the charge of his uncle, the Inquisitor, Miguel del Carpio, who spared no pains to give him a good education. He was sent to the Imperial College at Madrid, and seemed to be progressing quietly towards the holy state, to which, by his uncle, he was destined, when an odd whim struck the lad, and, being then fourteen, he went off on a roving expedition with a comrade. But he and his companion were speedily arrested as thieves on their trying to effect the sale of a chain of gold (probably stolen from Lope's uncle), and sent back to Madrid. The returning prodigal was but coolly received by his reverend relative, who declined to further concern himself with a nephew of such distinctly *lay* propensities. He, in consequence, became a soldier; and in 1577 served at Terceira against the Portuguese. After this, we find him taken in hand by Geronimo Manrique, Bishop of Avila, who sent him to finish his studies at the university of Alcala. Here he was again ripening for holy orders, and was nearly in fact ripe, when again the passion of the vagabond drove him out upon the world a pervert. For some time, at this period of his life, Lope disappears from public view; and probably his adventures were of the kind which a discreet biographer will always permit his hero to prosecute as far as possible in private. It is understood that in his dramatic romance, *Dorothea*, he afterwards favoured the world with a sketch of himself and of these his early experiences; and if this is in detail to be taken as history, Lope, on his own shewing, must have been no more a model of propriety than certain other great poets who might be named. Towards 1585, we find him again at Madrid, attached to the person of the young Duke of Alva, for whom he composed the piece entitled *Arcadia*, a tedious pastoral, with verses interspersed, which only in detached passages displays his brilliant ability. About this time, he married a lady of condition, by name Isabella de Urbino; but his domestic felicity was speedily cut short by a misadventure. Having had some difference with a gentleman of court, he satirised him in a filthy ballad; and on finding that he took it amiss, gave him satisfaction by running him through the body. For this he was thrown into prison, and afterwards exiled to Valencia. He returned to Madrid as soon as he could with safety, and soon after lost his wife, whom he is said to have tenderly loved. Grief for her death, complicated with want of success in another of his little love-affairs, drove him to join the famous *Armada*, then being fitted out for the conquest of England. Through the perils of this disastrous expedition Lope came with a whole skin, and in 1590 was again safe in Madrid. A brother, to whom he was much attached, and who sailed as an officer in the same vessel, had not the same luck, but died during the voyage. It is a characteristic trait, that Lope—who, whatever else he may be doing, must always be conceived as flooding out continuous torrents of verse—composed, amid the distractions of tempest and battle, a long poem, the *Hermosura de Angelica*, which, as a continuation of the *Orlando Furioso* of Ariosto, has found favour even with express admirers of that poet. Shortly after his return, he became secretary to the Marquis of Malpica, and subsequently to the Count of Lemos, whose service he quitted soon after his marriage, in 1597, to Donna Juana de Guardio, resolving thenceforward to trust solely to literature for his livelihood. This he could well do with every confidence, as already one of the most admired authors of the day, and by far the most popular dramatist. The years immediately succeeding, he himself frequently afterwards refers to as the happiest period of his life; but it was not of very long duration. At the age of seven, his son Carlos died; and soon after, in giving birth to a daughter, his wife also died. The double blow was severe. A mistress, indeed, remained to console him, Donna Maria de Luxan, by whom he had a boy and girl, the latter of whom, Marcela, was the

most beloved of all his children. But he had no doubt got a little tired of Donna Maria; and about this time he began to turn his thoughts seriously to religion. Having had as much vice as he cared for, he considered he had reached the point in his career at which piety might begin to be prosecuted with advantage. Accordingly, after an interval of devout preparation, he became, in 1609, a priest of the order of St Francis. Of his zeal in his new functions, there is evidence in the fact, that in January 1623, he took prominent part in the ceremony of burning a heretical brother of his order. As to his performance of priestly duty otherwise, strictly thus much is known, that, with his old unremitting assiduity, he continued to pour forth poems and dramas, not always of a clerical or decent kind. During his last years, he fell into a profound religious melancholy. Despite the decay of his strength, he was rigorous in keeping himself up to the severest mark of discipline; in particular, he scourged himself terribly. Finally, in the beginning of August 1635, he gave himself a scourging so terrible, that the walls of the chamber were found bespattered with his blood; and some days after he died of it, at the ripe age of 73. If the poet in his later days thus exercised a little severity with himself, we may allow him to have been the best judge as to how far the peccadillos of his earlier ones might deserve it.

Lope was the idol of his contemporaries; and on the fruits of his labour, he lived in Madrid in what might be called splendour, when the really far greater Cervantes was starving in the same street. To such an extent was the popular admiration of him carried, that his very name became a synonym of excellence; and people spoke of a Lope jewel, a Lope poem, or the like, as one of unsurpassable perfection. At this day, we smoke what, as a Lope (Lopez) cigar, is understood as of superior quality; and it seems not at all unlikely that the name is derived from the poet deceased some centuries. In one quality, at least, Lope must be held to have surpassed all other poets—his productiveness was something portentous, and without parallel. Setting aside his other multitudinous performances, the dramas on which his popularity mainly rested, and which have since perpetuated his fame, have been calculated to number not less than 1800. He himself, in one of his latest works, more modestly puts them at something over 1500, and assures us that to write a whole drama in a day was no unusual feat with him. Even if we suppose in this something of the fabulous, there remain in print between five and six hundred of these pieces, to testify to his enormous fecundity; and it is certain that many more of his plays were acted, which have not in this form survived. The quantity of his work considered, its quality is not much less surprising. His fertility of invention is marvellous; the ease and grace of his versification are unsurpassed in the language in which he writes; and his pieces, even when slight in substance, are instinct with life and dramatic movement. In deep and serious qualities he is deficient, on which ground he is now ranked below his immediate successor, and some time contemporary, Calderon. With this single exception, he remains, however, the chief ornament of the Spanish stage, and a not inconsiderable figure in the dramatic literature of the world. An intelligent and full survey of his works, so far as the infinity of them permits it to be full, will be found in Ticknor's *History of Spanish Literature*, to which readers are referred.

VE'GETABLE, in a scientific sense, is a term synonymous with plant. Organic nature is divided into the ***Animal Kingdom*** (q. v.) and the ***Vegetable Kingdom***. See PLANT. The word vegetable is derived from the Latin *vegetus*, lively, or healthy. *Vegetation* is the term employed to denote the growth of plants.

VEGETABLE CHEMISTRY, or the Chemistry of Plants, is so extensive a subject that it is impossible here to give much more than an enunciation of the most important propositions, without entering into full proofs or details. On submitting to incineration a plant which has been dried at a moderate heat till it ceases to lose weight, we find that the residue, which consists of mineral salts and a little carbon, is much lighter than the original plant, the portion which is burned off, or apparently lost, corresponding to the organic constituents of the plant. Hence every plant, like every animal, is composed of *organic* and *mineral* or *inorganic constituents*. While the mineral constituents of the plant are also found in the crust of the earth, the organic constituents are primarily formed in the plant itself from inorganic matters, viz., from *water*, *atmospheric air*, and the *soil*, which collectively may be termed the food of plants.

The following general principles may be laid down regarding the organic constituents which mainly contribute to form the bulk of the body of the plant. (1.) All organic constituents of plants contain *carbon*. (2.) All such organic constituents contain *hydrogen*. Some of them, as, for example, many ethereal or volatile oils, consist solely of these two elements. (3.) The greater proportion of these compounds contain *oxygen* in addition to the two preceding elements. To this class belong those constituents of plants which are at the same time of the most general diffusion and of the greatest physiological and economic importance; namely, the so-called *carbo-hydrates*, which consist of carbon combined with hydrogen and oxygen in the exact proportion in which the last two elements form water. Under this title are included cellulose, starch, gum, &c. Other organic constituents contain not only carbon with hydrogen and oxygen in the above ratio, but an excess of oxygen. In this category may be placed almost all the *organic acids*, many *ethereal oils*, *wax*, the *resins*, many of the so-called *glycosides*, and the *fats*. (4.) With the above elements, *nitrogen* is associated, to form two very important groups of constituents, viz., the *organic bases* or *alkaloids*, and the *albuminates* or *proteine bodies*. Although the nitrogenous groups never form more than a small part of the mass of a plant, nitrogen is never altogether absent from a plant. (5.) In association with all the above-named elements, *sulphur* in small quantity is present in the albuminates of all plants; in association only with carbon and hydrogen, it occurs in oil of garlic and oil of asafœtida; and when combined with carbon, hydrogen, and nitrogen, it has been as yet only found in oil of mustard. Whether *phosphorus* in very minute quantity occurs in any of the vegetable albuminates, is still uncertain.

The inorganic constituents which are found in the ashes of all plants are: *potash*, *soda*, *magnesia*, and *lime*, in combination with *phosphoric*, *sulphuric*, *hydrochloric*, and *carbonic acids*, and additionally, *iron*, *manganese*, and *silica*, with traces of *fluorine*; while the marine plants or sea-weeds contain also appreciable quantities of *bromine* and *iodine*. *Alumina* and *baryta* are also occasionally found, as also are *nitrates* in certain plants. The carbonates almost always found in the ash are, as is well known for the most part formed by the action of the incineration upon the salts of the vegetable acids, such as the acetates, citrates, &c., and probably in some other respects, the arrangements of the constituents of the ash are not precisely identical with

those of the mineral ingredients while existing in the actual plant. Amongst the most essential of the inorganic constituents is *water*, which acts as a solvent for the matters dissolved in the vegetable juices, and forms a very preponderating part of the mass, sometimes amounting to from 86 to 96 per cent. of the whole plant. From the preceding remarks, it is obvious that the nutrition and development of plants are dependent on their absorbing *carbon-compounds*, *hydrogen-compounds*, *nitrogen-compounds*, *sulphur-compounds*, *water*, and such *inorganic compounds* as yield the necessary inorganic constituents in a form capable of assimilation; together with the presence of *oxygen*, which is required for the formation of organic oxygenous compounds.

The assimilation of *carbon* first claims our attention. The composition of the atmospheric air, from whatever part of the earth's surface it is taken, is, as is well known, constant, in so far as the relative volumes of oxygen and nitrogen are concerned; while the variations in the carbonic acid, except when there are obvious causes for an excess (as, for example, an over-crowded room), are very slight, and, as a general rule, deviate scarcely at all from 4 volumes in 10,000 of air. Yet causes disturbing this uniformity are perpetually at work. Professor Mulder, adopting Lavoisier's and Davy's experiments, according to which a man consumes about 26 cubic feet of oxygen in 24 hours (and later observers place the daily quantity at 45 cubic feet), calculated his yearly consumption at more than 9500 feet. Considering the enormous numbers of men and animals on the surface of the globe, and the lamps, fires, furnaces, &c. ever burning, the atmosphere would apparently soon cease to be fit for the support of life (1) in consequence of the great diminution of oxygen, a gas essential to life, and (2) in consequence of the great excess of carbonic acid, a gas deleterious to life. The cause of this marvellous uniformity of atmospheric air under these circumstances is that function of plants by which they absorb their carbon. It is to the experiments and observations of Priestley in 1771, Ingenhousz in 1776, Senebier in 1807, and many later observers, that we are indebted for the knowledge of the great general fact, that plants take up the carbonic acid from the air, reduce it in their organism, and retain the carbon for the composition of their own organisms, while they restore the oxygen gas to the atmosphere. It is chiefly by the leaves, which may be regarded as the respiratory organs, that this process is carried on. It is needless here to notice the questions as to whether it is only during light, or constantly, that these changes go on; whether different rays of the spectrum act with more or less power in liberating the oxygen, &c. Independently of the proof afforded, for example, by placing green plants in a mixture of 70 parts of common air and 30 parts of carbonic acid, and finding that, in the course of four hours, the carbonic acid has been almost entirely replaced by oxygen, we have obvious evidence in the case of lichens growing on a naked rock, that the carbon which they contain must be obtained from the atmosphere. In the case of aquatic plants, the process is identical, the atmospheric air being dissolved in the water. Carbon, in some form of combination or other, probably forms about two-thirds of the weight of a dried plant. The assimilation of *hydrogen* from the decomposition of water in and by the plant, is not capable of the same direct proof as that of carbon; but there are strong grounds for believing in its occurrence. This view is supported by the composition of wax, the resins, volatile oils, &c., and indeed it is difficult to see from what other source the hydrogen could be derived. In that case, the water, like the carbonic acid, contributes its oxygen to the air. The *nitrogen*, which enters into certain constituents of plants, is derived from ammonia, and not, as might have been supposed, directly from the air, of the volume of which it forms about four-fifths. It has been shewn by the direct observations of Boussingault, that plants cannot assimilate nitrogen, that those which have been made to absorb it by placing their roots in nitrogenous water, throw it off unchanged, and that vegetation cannot exist in a soil which contains no substances readily convertible into ammonia. The indifference of nitrogen to other elements, and the extreme readiness with which ammonia becomes decomposed, and enters into different combinations (the amides, imides, amido-acids, compound ammonias, and probably also the albuminates, being derivatives of it), together with the conclusion we draw from the action of liquids containing ammonia, or matter convertible into it, as gas-liquid, fluid sewage, &c., confirm this view. The ammonia taken up by plants is obtained partly from the air, and partly from the soil. In the air it is formed after thunderstorms, and it is further supplied to the atmosphere by putrefactive processes, animal excretions, and volcanic action. It is indeed found in snow and in all rain-water, and is thus conveyed to the soil. Although direct experiments shew that the air contained in the pores of the soil is richer in ammonia than ordinary atmospheric air, it is easy to shew that a plant can derive its ammonia from the latter alone, by a reference to the vegetation on naked rocks, or by growing plants in powdered charcoal duly moistened with rain-water. Hence both air and soil contribute the ammonia from which the nitrogen is fixed in the plant. The *oxygen* which occurs in the various constituents of the plant is derived from the decomposed carbonic acid and water, and corresponds to the difference between the amount contained in those absorbed compounds and the amount liberated to the atmosphere. The *sulphur* that occurs in the albuminates and certain ethereal oils must be derived from the soil, since it does not occur either free or in combination in the air; and as the only form in which it is found in common soil is as sulphates, plants must have the property of decomposing these salts, and appropriating their sulphur after reduction. Extensive experience has proved that certain *inorganic constituents* are as indispensable to the life and development of the plant, as the organic elements we have been considering; and further, that special plants require special inorganic constituents. The two following facts seem well established: (1) that the roots of plants exert a special selective power, and absorb some salts, and reject others that are also in solution in the water of the soil; and (2) that the top or vegetable soil has the power of absorbing and retaining the most necessary mineral ingredients, and does not allow them to be carried deep into the ground by the rain; but for the discussion of this subject, we can only refer to the experimental researches of Liebig, Mulder, Huxtable, Way, &c. It would be altogether out of place to enter into the consideration of the prodigious synthetic and analytic power of the vegetable cells; we shall merely indicate how some of the most important vegetable compounds are probably formed, beginning with the *vegetable acids*. 'Even,' says Professor Gregory, 'when carbonic acid and water are brought together in the cell, this is not enough. There must be present, first, albuminous matter, without which no active cell can exist; secondly, mineral matter, especially alkalies, phosphates, and salts. All these conditions being fulfilled, and light being admitted, we may suppose the first organic

acid formed to be oxalic acid, the least complex of all.'—*Organic Chemistry*, 4th ed. p. 541. Putting it in the briefest terms, the cell separates 1 equivalent of oxygen from 2 equivalents of carbonic acid, and yields 1 equivalent of *oxalic acid*, or $2(H_2CO_3) - O = H_4C_2O_5 = C_2H_2O_4 + H_2O$. Two equivalents of dry oxalic acid, $C_2H_2O_4$, by taking up 1 equivalent of water, and losing 3 equivalents of oxygen, yield *malic acid*, $C_4H_6O_5$. *Tartaric* and *citric acids* are capable of a similar production. Thus 2 equivalents of dry oxalic acid, combining with 1 of water, and losing 2 of oxygen, yield tartaric acid, $C_4H_6O_6$; and similarly, 3 equivalents of dry oxalic acid, combining with 1 of water, and losing 5 of oxygen, yield hydrated citric acid, $C_6H_8O_7$. In like manner, every vegetable acid, and every one of the neutral compounds of carbon, hydrogen, and oxygen, may be derived from some less complex compound, containing mere hydrogen than itself; or it may be supposed to be derived directly from carbonic acid and water, oxygen being, on every supposition, given off. 'As the proportion of oxygen to carbon diminishes, the acids become weaker, till the oxygen exactly suffices to form water with the hydrogen, when we have either very feeble acids, or neutral bodies, such as sugar, gum, and starch. As the oxygen is still further diminished, we have neutral, bitter, and acrid compounds, or coloured bodies, or such as yield colouring matters, with ammonia and oxygen; further on still, we have aromatic oils, and volatile, quasi-resinous, crystallisable acids; then resins; and lastly, when all the oxygen is expelled, certain oils, which are carbo-hydrogens.'—Gregory, *op. cit.*, p. 543. Although each individual substance is doubtless in reality derived from some substance only a little less complicated than itself, the final result, in so far as shewing their mode of construction is concerned, is the same as if they were all obtained directly from carbonic acid and water. The following tabular view (compiled by Gregory) will serve to shew how all the leading groups of vegetable compounds are produced from carbonic acid and water by deoxidation:

SUBSTANCES FORMED. Name.	Formula.	=	Carbonic Acid.	+	Water.	—	Oxygen.
1. *Vegetable Acids*—							
Tartaric acid,	$C_4H_6O_6$	=	$4CO_2$	+	$3H_2O$	—	50
Malic acid,	$C_4H_6O_5$	=	$4CO_2$	+	$3H_2O$	—	60
Citric acid,	$C_6H_8O_7$	=	$6CO_2$	+	$4H_2O$	—	90
2. *Carbo-hydrates*—							
Cellulose,	$C_6H_{10}O_5$	=	$6CO_2$	+	$5H_2O$	—	120
Starch,	$C_6H_{10}O_5$	=	$6CO_2$	+	$5H_2O$	—	120
Cane-sugar,	$C_6H_{12}O_6$	=	$6CO_2$	+	$6H_2O$	—	120
3. *Other Neutral Bodies**—							
Mannite,	$C_6H_{14}O_6$	=	$6CO_2$	+	$7H_2O$	—	130
Salicin,	$C_{13}H_{18}O_7$	=	$13CO_2$	+	$9H_2O$	—	280
Pectin,	$C_{32}H_{48}O_{32}$	=	$32CO_2$	+	$24H_2O$	—	560
Hæmatoxylin,	$C_{16}H_{14}O_6$	=	$16CO_2$	+	$7H_2O$	—	330
Elaterin,	$C_{20}H_{14}O_4$	=	$20CO_2$	+	$7H_2O$	—	430
4. *Oxygenated Volatile Oils, and Allied Acids*—							
Oil of Bitter Almonds,	C_7H_6O	=	$7CO_2$	+	$3H_2O$	—	160
Benzoic acid,	$C_7H_6O_2$	=	$7CO_2$	+	$3H_2O$	—	150
Oil of Cinnamon,	C_9H_8O	=	$9CO_2$	+	$4H_2O$	—	110
Cinnamic acid,	$C_9H_8O_2$	=	$9CO_2$	+	$4H_2O$	—	100
5. *Oily and Fatty Acids*—							
Acetic acid,	$C_2H_4O_2$	=	$2CO_2$	+	$2H_2O$	—	400
Butyric acid,	$C_4H_8O_2$	=	$4CO_2$	+	$4H_2O$	—	100
Valerianic acid,	$C_5H_{10}O_2$	=	$5CO_2$	+	$5H_2O$	—	130
Stearic acid,	$C_{18}H_{36}O_2$	=	$18CO_2$	+	$18H_2O$	—	520
6. *Resins and Camphors*—							
Many Resins,	$C_{20}H_{30}O_2$	=	$20CO_2$	+	$15H_2O$	—	530
Camphor,	$C_{10}H_{16}O$	=	$10CO_2$	+	$8H_2O$	—	270
Borneo Camphor,	$C_{10}H_{18}O$	=	$10CO_2$	+	$9H_2O$	—	280
7. *Carbo-hydrogens*—							
Oil of Lemons,	$C_{10}H_{16}$	=	$10CO_2$	+	$8H_2O$	—	280
Oil of Turpentine,	$C_{10}H_{16}$	=	$10CO_2$	+	$8H_2O$	—	280
Oil of Juniper,	$C_{10}H_{16}$	=	$10CO_2$	+	$8H_2O$	—	280
Cumene,	C_9H_{12}	=	$9CO_2$	+	$6H_2O$	—	240
Cymene,	$C_{10}H_{14}$	=	$10CO_2$	+	$7H_2O$	—	270

A glance at the composition of these seven groups shews that they present a series of deoxidations, till in the sixth, very little oxygen, and in the last, no oxygen whatever, is left. Thus, leaving out of view, for want of space, the compounds in which nitrogen and sulphur enter, 'oxalic acid is first formed, and then malic, tartaric, citric, &c. acids from it, or from each other; then sugar, starch, &c. from the acids; bitter, acrid, and coloured compounds from the sugar, starch, &c.; then oxygenated volatile oils; and then acids perhaps also from sugar, &c.; then the oily and fatty acids, either from the preceding oils and acids, or from sugar; then the resins from the fats, or from sugar; and lastly, the carbo-hydrogens. Thus, we have a picture of the whole process of vegetation as far as concerns compounds devoid of nitrogen and sulphur; and we find it uniformly to be one of deoxidation.'—Gregory, *op. cit.*, p. 548. To produce nitrogenous compounds, such as asparagine, amygdaline, nicotine, morphine, caffeine, &c., it is only additionally necessary that ammonia should be present, and the plant by a similar process gives rise to nitrogenous products, the process being shewn as below:

Asparagine, $C_4H_8N_2O_3 = 4CO_2 + H_2O + 2NH_3 - 60$
Amygdaline, $C_{20}H_{27}NO_{11}.3H_2O = 20CO_2 + 15H_2O + NH_3 - 410$
Nicotine, $C_{10}H_{14}N_2 = 10CO_2 + 4H_2O + 2NH_3 - 160$
Morphine, $C_{17}H_{19}NO_3 = 17CO_2 + 8H_2O + NH_3 - 390$
Caffeine, $C_8H_{10}N_4O_2 = 8CO_2 + 4NH_3 - (H_2O + 013)$

It is easy to shew how the sulphur contained in certain oils (oil of garlic, $C_6H_{10}S$, for example) is probably obtained by the reduction of the sulphuric acid existing in the sulphates of the soil; but the composition of the albuminates containing both sulphur and nitrogen is so complex that we cannot venture to attempt a popular explanation of the mode of formation of these matters from the simple food of plants.—On this subject the reader may

* In this group, which is very numerous, compounds of a most discordant character appear. Of the specimens we have selected, the first closely resembles a sugar; the second is a pure bitter; the third, a gelatinising substance · the fourth, a pigment; and the fifth, an acrid poison.

VEGETABLE PHYSIOLOGY. All the most important departments of this subject have been already noticed in this work under the various headings of CIRCULATION OF SAP, FLOWER, FRUIT, LEAVES, METAMORPHOSIS OF ORGANS, PLANT, ROOT, SEED, SPORE, STEM, &c. We shall therefore here only discuss one subject, which has not been separately considered—namely, the organs and functions of reproduction in plants. Although, as we learn from Herodotus, the Babylonians knew that there were male and female date-trees, and that the female required the concurrence of the male to become fertile, and Theophrastus, in his work *On the History of Plants*, and other ancient authors, frequently mention the sexes of plants, Cæsalpinus, who died at Rome in 1603, seems to have been the first writer who directed his attention to the reproductive organs of plants; and he speaks vaguely of an emanation from the male causing fertility in the female; and Grew, in 1676, seems to have been the first who distinctly recognised the functions of the stamens and pistils. Ray, in his *Historia Plantarum*, 1694, adopted and enforced Grew's view; and Geoffroy, in 1711, read a Memoir before the Royal Academy supporting the same view. Linnæus, in his *Systema Naturæ* (1748), made these organs the foundation of his system of classification into sexual and non-sexual plants, the former being phanerogamous, or flowering, and the latter cryptogamous, or flowerless; in the latter division of plants, he could not detect stamens or pistils; and it was not till 1782, when Hedwig's work on Mosses was published, that anything was known with certainty regarding the sexual organs of any of the cryptogamia. From this brief notice of the early history of this subject, we proceed to the consideration of reproduction in the phanerogamous plants. A complete flower consists, as is well known, of four whorls (*verticils*), placed alternately within one another, the two internal being the *Stamens* (q. v.) and *Pistils* (q. v.), which are the essential organs of reproduction; while the two external are the *calyx* and *corolla*, which constitute the floral envelopes or protective coverings. Both the stamens and the pistils originate, like the floral envelopes (see FLOWER), from the thalamus, or upper part of the axis or peduncle, in the form of minute cellular processes; and in their development they resemble leaves, although, in their appearance, they are less like leaves than are the floral envelopes. These parts are well seen in the following diagram (fig. 1) of the flower of the vine, after it has cast its petals. There are here five stamens (the filament of one being concealed by the pistil), with introrse* two-lobed anthers. As separate articles are devoted to STAMENS and PISTILS, it is unnecessary to enter into any details regarding their anatomical structure. A few additional remarks on the pollen are, however, called for. This (the male fertilising agent) consists of cells contained in the anther case, and is discharged by various kinds of longitudinal, transverse, valvular, or porous dehiscence. When examined by the naked eye, it usually appears as a yellow powder; but when magnified, it is found to consist of cellules of different singular forms, varying in size from $\frac{1}{300}$th to $\frac{1}{700}$th of an inch in diameter. Oval, spherical, and triangular forms of pollen are shewn in figs. 2 to 6; and they may be square, cylindrical, hour-glass shaped, &c. These pollen-grains are developed in the large cells in the early stage of the anther. The contents of each cell divide first into two, and afterwards into four parts, each of which becomes covered with cellulose, so as to constitute independent cells or grains. These grains either burst through the parent cell, and become liberated, or they remain united in fours or some multiple of four, as in many species of acacia; or in large masses, such as those seen in Orchids and in Asclepias, when they constitute *pollinia.* Each pollen-grain has usually two coverings: the outer one, called *extine*, being a firm membrane, often marked with bands or rough points; and the inner one called *intine*, which is thin, and capable of extension. In the interior of the pollen-grains, a minute granular matter exists, called *fovilla*—the granules, which are mixed with starch and oil, varying from $\frac{1}{4000}$ to $\frac{1}{30000}$ of an inch in diameter. On moistening pollen-grains in water, they swell till the *intine* bursts at one or more points, and expels the fovilla. In the act of impregnation, the pollen is scattered on the pistil, and is moistened on one side by the fluid of the stigma (a part of the pistil composed of loose cells, which secrete a viscid fluid, and are uncovered by

Fig. 2.—Elliptical Pollen of Milkwort (*Polygala*), viewed lengthwise. Its surface, or extine, *e*, is marked with grooves or slits, *f*, where the intine protrudes. Fig. 3.—Ripe round Pollen of Cherry (*Cerasus*) discharging its fovilla through a tubular opening formed by the intine. There are two other points at which the intine is seen protruding. Fig. 4.—Triangular Pollen of Evening Primrose (*Œnothera*), with one pollen tube protruding. This tube is formed by the intine, which is also seen projecting at the other angles. Fig. 5.—Round ripe Pollen of Hollyhock (*Alcea*), with its extine covered with prominent points. Fig. 6.—Pollen of Fir (*Pinus*), in which, by the increase of the intine, the extine is separated into two hemispherical portions marked by the dark spaces at each end of the grains.

* This term is applied to anthers which open on the side next the pistil.

epidermis). It is then observed that the intine, instead of bursting, protrudes in the form of a tube called the *pollen-tube.* The number of these tubes varies greatly in different plants. According to Amici (as quoted by Balfour, to whose useful *Class-book* we are indebted for most of our facts and illustrations), the two pollinia (fig. 7) of *Orchis morio* contain each about 200 secondary small masses, composed of grains united in fours, and each of these small masses presents 300 openings capable of emitting tubes. In order that an embryo plant may be formed, the mature pollen must be discharged from the anther-cells of the stamen, and brought into contact with the stigma, through which, and then through the conducting tissue of the style, it must pass until it reaches the foramen, or micropyle, of the ovule. The means by which this contact is accomplished are various, such as elasticity and irritability of the stamens, the action of currents of air, and the intervention of insects passing from the male to the female plant. In the case of the orchids, fertilisation is solely effected by the agency of insects. The fertilising power of pollen is retained for a different length of time in different plants: thus, while in most species of Datura, and in *Lychnis dioica*, it loses its power in two days, in the wall-flower it remains efficacious for 14 days; while in the date, cannabis, tea, and camellia, it will keep fresh for a year; indeed, Micheaux mentions that the pollen of the date has been successfully used after 18 years! The quantity of pollen that is produced is much greater than is actually required for the impregnation of the ovules. Thus, in the Firs and Pines, the quantity is enormous, probably because of the obstacles here presented to fertilisation. The *sulphur showers* occurring in some districts are composed of the yellow pollen carried by the winds from pine-forests; and the showers of coloured rain which are occasionally noticed are due to a similar cause. The number of pollen-grains in certain flowers has been calculated. In a plant of *Cereus grandiflorus*, Morren observed that there were 40 flowers, each containing 500 stamens, and that each anther contained 500 pollen-grains; hence the entire number of pollen-grains in each flower was 250,000, and in the whole plant is 10,000,000. Similarly, in an entire Rhododendron plant, the pollen-grains amount to 72,620,000. The quantity required for fertilisation is very small—one, two, or at most three grains, being sufficient to impregnate one ovule. In most cases, the pollen of a single anther is sufficient for complete impregnation; the additional anthers being, as it were, added for the purpose of insuring the result. During the evolution of the stamens, and the maturation of the pollen, the pistil undergoes certain changes, of which the most important is that the stigma becomes enlarged, lax, and covered with a viscid secretion, which, besides detaining the pollen-grains, causes them to protrude their tubes, as already described; moreover, in some flowers, the style, which is sometimes covered with hairs, elongates during the discharge of the pollen, brushes the latter on to the pistil, and thus acts directly in fecundation. One of the central cells of the ovule now becomes much enlarged and developed, so as to form the embryo sac. At the end of this sac, next to the micropyle, several free nucleated cells are formed, to which the name of embryo vesicles, or germinal vesicles, has been given. In this way, the ovule is prepared for the action of the pollen, and for the production of the embryo plant. The tubes developed by the pollen-grains, when acted on by the secretion of the stigma, pierce the stigmatic tissue, and carry the fovilla through the canal of the style to the ovule, as shewn in the figures (8, 9, and 10). In some plants, the emission of tubes begins in half a minute after the pollen has been caught by the stigmatic secretion; in other cases, it does not begin for 24 hours or more; and it is said that in the larch, the tubes do not emerge for 35 days. The length to which the tubes extend is often very great, but the diameter is extremely small. In *Colchicum autumnale*, in which the style is 13 inches long, the length of the tube is 9000 times the diameter of the grain from which it proceeds. The time taken by the tube to traverse the length of the style varies, but does not always correspond with the

latter. In some short-styled plants, the time is very long, while in the long-styled *Colchicum autumnale*, the pollen-tube reaches the ovule in about 12 hours. In some coniferous plants, a year is required for the process.

We now proceed to consider the embryogeny of (1) Gymnospermous and (2) Angiospermous Phanerogams. In the gymnospermous or naked-seeded flowering-plants, such as the coniferæ and cycadaceæ, impregnation is effected by direct contact between the pollen and the ovule, there being no true ovary bearing a stigma. The process is thus summarised by Balfour: "In gymnospermous plants, there are stamens containing pollen, and ovules supported on cones or altered branches, and in them the pollen enters the large micropyle of the ovule without the intervention of stigma or style. When the pollen reaches the nucleus of the naked ovule, it remains long dormant, and after many weeks and months, sends out a tube which reaches the embryo sac, and impregnates a corpuscle. One of the cells of the corpuscle then takes an active function, and develops the embryo with the suspensor in the midst of endospermal cells.'—*Op. cit.*, p. 600. In the angiospermous phanerogams, when the pollen-tube has traversed the tissue of the style, and reached the ovule, it proceeds through the foramen, or micropyle, so as to come in contact with the embryo sac; and consequent on this is the development of the cellular embryo. There is, however, much dispute as to what now occurs. 'Schleiden thinks that the end of the pollen-tube introverts the embryo sac, and in some cases perforates it, and that it becomes the first cell in the embryo. Most physiologists, however, agree in thinking that Schleiden was mistaken in regard to the extremity of the pollen-tube, and they believe that the embryo is formed from a distinct cell previously existing in the embryo sac. In some instances, the pollen-tube indents the embryo sac, at other times it perforates it, and comes into actual contact with a cell contained in the sac. In the embryo sac there are produced, before impregnation, certain cells, often three, which are called germinal vesicles, only one of which in general is impregnated by the pollinic fluid, which transudes through the membrane of the pollen-tube and the walls of the embryo sac and vesicles. After impregnation, the vesicle divides by a transverse septum into two parts, the upper portion forming a confervoid partitioned filament or suspensor, and the lower becomes filled with cells, constituting the rudimentary embryo. The suspensor is attached to the part which forms the radicle of the embryo, and at the opposite end, one or two cotyledons are produced, enclosing the fresh bud or plumule. An embryo is usually produced in each ovule (monembryonomy); but when more than one germinal vesicle is impregnated, there is a plurality of embryos (polyembryonomy). When the pollen of one species is applied to the pistil of another species, we occasionally find seeds produced which give rise to individuals intermediate between the two parents; these individuals are called hybrids or mules, and are rarely fertile. A plant has, however, a preference for the pollen of its own species, and hence hybrids are rare in nature.' —Balfour, *op. cit.*, p. 600. A reference to the preceding figure of a section of part of the ovule of a species of *Speedwell*, will elucidate the above summary: it shews the pollen tube *a*, just as it reaches the embryo sac which contains the rudimentary embryo *d*, attached to the sac by its suspensor *b*, and endospermal cells *c*, at the lower part of the sac. The suspensor is sometimes of considerable length, and as much as three, or even five times the length of the whole seed. Its attachment to the radicular end of the embryo is shewn in fig. 11. In monocotyledons, a single sheathing cotyledon is developed; in dicotyledons, two opposite leaves; and after their formation, the apex produces the terminal bud or plumule. The embryo is thus suspended in an inverted position in the seed.

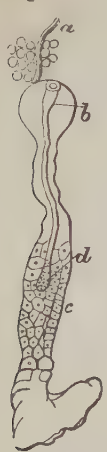

Fig. 11.

Section of part of the Ovule of a species of Speedwell (*Veronica triphyllos*), showing the pollen tube, *a*, passing through the cellular tissue of the nucleus, and reaching the embryo-sac, which contains the rudimentary embryo, *d*, attached to the sac by its suspensor, *b*, and endospermal cells, *c*, at the lower part of the sac.

The embryo in different stages of development: *a*, Embryo in young state as a globular mass at the end of a suspensor. *b* and *c*, Embryo more advanced. *d*, Embryo shewing the division into two cotyledons.

It is impossible to enter into any general description of the organs or process of reproduction in cryptogamic plants. In this great division of the vegetable kingdom, the organs of reproduction are in general obscure, and consist usually of cellular sacs of two kinds—one being called *antheridia*, containing *phytozoa* or *spermatozoids*, representing the stamens, or the male; and the other being called *pistillidia* or *archegonia*, and representing the pistil, or the female. These structures, in a magnified state, are shewn in figs. 13 and 14, as they occur in the liverwort. In the fully developed

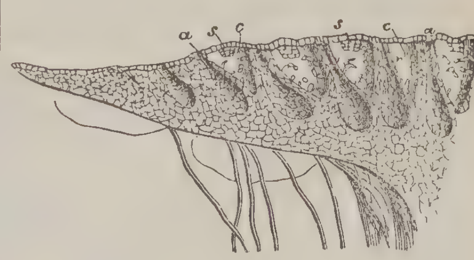

Fig. 13.

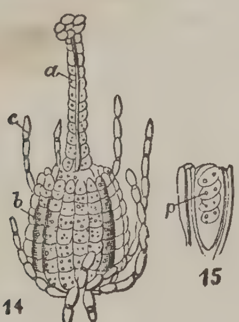
Vertical section of the disc-like receptacle of Liverwort (*Marchantia*), shewing the antheridia, *a a*, in its substance. These antheridia are flask-shaped sacs containing phytozoary cells. They communicate with the upper surface; and their contents are discharged through it. Between the antheridia there are air cavities, *c c*, connected with stomata, *s s*.

state of the plant, the antheridia disappear, while the pistillidia are transformed into cellular sacs containing germinating bodies known as Spores (q. v.), which are considered as being formed by a process of reproduction, and as being analogous to cellular embryos. These spores are developed in mother-cells, the contents of which often divide into four, such mother-cells being called sporidia. With regard to the antheridia and the pistillidia

in the different orders of cryptogamic plants, Dr Balfour observes that in ferns they are supposed to exist in a pro-thallus or cellular expansion produced by the spore when it germinates. A cell of the pistillium (the ovular body) afterwards gives rise to the spore-bearing leaves (the fronds). After impregnation, the archegonial cells give rise to a sporingiferous frond. The spores are contained in sporangia, with or without an elastic ring, developed on the back, on the side, or at the base of the leaves. In mosses, these organs are seen at certain stages of the plant's growth, and they are either on the same or on different plants. After impregnation, the archegonial cell gives rise to a stalked theca or sporangium with its spores. In liverworts, they are usually on different parts of the plant, and as frequently in the substance or on the under surface of disc-shaped cellular stalked expansions. Here the impregnated cell gives rise to the fruit or capsules. In lichens, the existence of these organs has not been already established; and the fructification consists of *thecæ* or *asci*, containing 4, 8, 12, or 16 sporidia (or cells containing spores) in their interior. (In fig. 15, a theca containing four sporidia is shewn.) These thecæ are usually



Figs. 14 and 15.

Fig. 14.—Pistillidium of Liverwort. It is a cellular body surrounded by an involucre, *b*, and separate filaments, *c*, and is provided with a styloid calyptra. Fig. 15.—A Theca of a Lichen, containing four nucleated cells. These cells ultimately form the sporidia or sacs containing numerous minute spores. Round the theca are cellular filaments, *p*.

united together so as to form a cup-like mass of fructification. When mature, the sporidia or thecæ burst, and discharge the spores. The fungi, antheridia, and pistillidia are obscure, and the organs of reproduction are spores which are either naked or are contained in thecæ. In algæ, antheridia and pistillidia have often been detected; but in some of them, certain cells, in the same or separate filaments, seem to possess the property of producing spores by a process of conjugation or union; and in the lowest forms the cells undergo division into new individuals.

Besides the above-noticed modes of propagation, cryptogamic plants are also propagated by buds or gemmæ, which are either attached to the leaves or fronds, or are contained in peculiar cup-shaped bodies.—For further information on the subject of this article, the reader is referred to Carpenter's *General and Comparative Anatomy*, and to Balfour's *Class-book of Botany*, from which we have borrowed freely in the composition of these pages.

VEGETABLE TISSUE, the term employed in Botany to denote the whole substance of which plants consist; regarded according to its structure, rather than to functions or chemical composition. The principal kinds are noticed in the articles CELLULAR TISSUE and VASCULAR TISSUE.

VEGETA'RIANISM, the doctrine that vegetable substances are the solids intended by nature for the sustenance of man, and that it is wrong—against nature and against good morals—for men to make use of an animal diet. There have never been wanting among speculative persons some who maintained that fruits and vegetables are the proper food for men; and illustrious names, such as those of Pythagoras, Plato, Plutarch, in ancient times—of Rousseau, Shelley, Swedenborg, in modern, can be counted among the upholders of this doctrine. A society for promoting the practice of vegetarianism was established at Manchester in 1847; and three years later, a similar society was established in the United States. Besides a short-lived publication called the *Vegetarian Advocate*, the vegetarians in this country for about a dozen years maintained a monthly journal, the *Vegetarian Messenger*, which was published at Manchester; but since 1861, they have been without an organ. The vegetarian creed has attracted very few disciples in England; and by these the advocacy of it has usually been conjoined with that of temperance, peace, homœopathy, and the cold-water cure.

There is, first, a physiological argument used in behalf of vegetarianism. It is said that the formation of the teeth and of the intestines in man proves that man was not intended to be a carnivorous, but a fruit and vegetable eating animal. Then it is maintained that a vegetable diet is the most favourable to man, in all respects, physical, intellectual, and moral; that with it, his life is longer, his enjoyment of life greater, his brain more vigorous, and his power of manual labour not less than with an animal diet; and that, while the use of animal food begets ferocious dispositions, a carelessness about life, a callousness to the sufferings of men or animals, a vegetable diet 'develops the gentler affections, and produces a broad and genial sense of brotherhood.' It is affirmed that animal food produces febrile and inflammatory tendencies; that, like alcohol, it is a stimulant (some vegetarians call it a stimulating poison); and that a mixed diet is open to all the objections which lie against moderate drinking. It is also alleged that animal food as exposed for sale is often tainted with some disease or unwholesome condition, and that it thus becomes a frequent cause of disease in men. Moreover, it is submitted that vegetables contain all the principles necessary for the sustenance of man; that, therefore, the use of flesh is unnecessary; and that this being so, it is selfish, cruel, and tyrannical—calculated, too, to increase selfishness, cruelty, and tyranny in men—to cut short the existence of inferior animals.

The opinion of physiologists is not favourable to vegetarianism. The structure of man's organs is held to prove that nature intended him for an omnivorous animal, his stomach and intestines being fitted for deriving nourishment from every kind of food, and he being able, by means of cooking, to modify his food so as to prepare it for mastication and digestion. There is also almost a concurrence of medical experience against vegetarianism, and in favour of the opinion that man, as regards all his powers and faculties, thrives best, and that—if a difference can be made out—he also lives longest upon a mixed diet. It has been found, in making railways, that differences between workmen in respect of bodily strength and energy were chiefly due to a difference of diet; that, for example, a beef-eating Englishman would almost do the work of three vegetable-fed Frenchmen, and that this difference of working-power disappeared when the Frenchmen took to eating

beef. Upon the alleged beneficent moral influence of vegetable food, it may be observed that there is no proof whatever of its reality; moreover, that since the majority of mankind live either mostly or entirely upon vegetables, vegetables must bear a large share of the responsibility which may fall upon diet for the evil tendencies of man; and that, in fact, the most cruel and the most debased of human races live entirely upon vegetables. To the charge of cruelty brought against the practice of killing animals for food, it has been answered, that the plan of nature contemplates such cruelty—if cruelty it be—and makes it impossible to avoid it; that the microscope has shewn us that even in taking a draught of water we may deprive a multitude of beings of life; and that, on the other hand, the system of rearing cattle for the butcher—since the cattle would otherwise not be reared at all—really adds very largely to the sun of happy animal existence. It is not disputed that there is a liability to disease from the use of unwholesome meat; but, then, vegetables as well as animals are subject to diseases; and the reasoning which would drive us from the use of animal food because it may be diseased, would really cut us off from food altogether.

VEHMGERICHTE. See FEMGERICHTE.

VE'II, an ancient city of Etruria, in early times the formidable rival of Rome. Its very site is disputed, but is now generally thought to be at *Isola Farnese*, about 12 miles from Rome. The struggle between the two cities is recorded by Roman historians to have commenced as early as the time of Romulus, and to have continued under each of the kings, except the pacific Numa, and always to the advantage of the Romans. The Veientines had their revenge so far under Porsenna; but after his time, being convinced by repeated defeats that they were no match for their enemy in the open field, they had recourse to the plan of sheltering themselves behind their walls on the approach of the Roman legions, and of sallying out on predatory expeditions as soon as they had retired. To relieve the republic from this annoyance, the Fabian clan, to the number of 306, with their followers, probably ten times as numerous, undertook to garrison a fortress near Veii, and act as a guard against the marauders. They were, however, enticed into an ambuscade, and cut off to a man at the Cremera. For the next 60 years, hostilities often broke out, followed by ill-observed truces. At last, the Romans determined to rid themselves of their rival by a siege, and persevered with great tenacity, though the city held out for ten years, and repeated attempts were made by neighbouring states to relieve it. It is said to have been taken at last by a mine, which was directed so as to lead into the citadel. The citizens were massacred or sold as slaves, and the land confiscated. The fall of Veii took place 396 B.C. It was debated more than once, especially after the destruction of Rome by the Gauls, whether Rome should not be abandoned, and Veii made the capital. After its fall, it was gradually deserted; and although, in later times, a colony was planted there by Cæsar, and again by Augustus, it always remained an insignificant place. There are remains of the Etrurian, and also of the Roman city, which have latterly been traced out and described.

VEIL. This familiar article of dress is one of the most ancient in use; its origin is lost in remoteness, but we find an allusion to the wearing of veils by the Chinese in Ovid, and Juvenal speaks of women as being so delicate as to be overheated by a silken veil. Although generally considered portions of female dress, we read in the works of Ambrose (374 A.D.), of 'silken garments and veils interwoven with gold, with which the body of the rich man is encompassed.' Its use is now so extended that it may be found in every part of the civilised world, but almost exclusively confined to women.

VEINS, in Anatomy, if we except the pulmonary, the portal, and the umbilical veins, are the vessels which carry back venous blood from the capillaries, and enlarging as they proceed finally pour it through the ascending and descending *venæ cavæ* into the right auricle of the heart. See CIRCULATION. Their coats are similar to those of the arteries, but much thinner, and even transparent. They are, however, of considerable strength. The *internal coat* consists of an epithelial layer, supported on several laminæ of longitudinal elastic fibres. The *middle* or *contractile coat* consists of numerous alternating layers of muscular and elastic fibres; the muscular fibres being disposed circularly round the vessel. The muscular fibres are wanting in some parts of the venous system, and specially developed in others (as, for example, the splenic and portal veins, where, perhaps from the physical character of the tissues which they pervade, there may be more than the ordinary resistance to the passage of the blood). In the *venæ cavæ* and pulmonary veins near the heart, striped muscular fibres may be detected, continuous with those in the auricles. The *external* or *areolar fibrous coat* consists of connective or areolar tissue, and of longitudinal elastic fibres; within some of the larger veins, as the inferior *vena cava*, through its whole length, the external iliacs, the azygos, &c., there is also a longitudinal network of unstriped muscular fibres. The existence of valves in the veins is mentioned in the article CIRCULATION. These valves are most numerous in the veins of the extremities, especially the lower ones, these vessels having to act against the force of gravity more than most others. They are absent in the *venæ cavæ*, the hepatic, portal, renal, pulmonary, and some other large veins, and in very small veins generally. The veins are nourished by nutrient vessels, or *vasa vasorum*, like the arteries; but except in a few instances (including the inferior *vena cava*), nerves are not distributed to them.

The chief diseases of the venous system have been already sufficiently described in the articles PHLEBITIS, OR INFLAMMATION OF THE VEINS; PHLEBOLITES; PHLEGMASIA ALBA DOLENS, OR MILK-LEG; THROMBUS; and VARICOSE VEINS. We shall here merely refer to two conditions of the venous system which must be regarded as the results of natural rather than morbid action: they are *Hypertrophy* and *Atrophy*. Hypertrophy is a natural and healthy change, which will be readily understood by one or two illustrations. When the uterus enlarges during pregnancy, the quantity of blood in it increases in at least a corresponding ratio, and so also do the venous canals by which it is removed; while, shortly after delivery, they return to their natural size; the hypertrophy being accompanied with a proportionate dilatation. This form of hypertrophy, with dilatation, often exerts a compensative action, one vein, or set of veins, taking additional work (and consequently requiring an increase of calibre), to make up for the partial or entire occlusion of another. When, for example, the ascending vena cava is diminished in size, or even entirely and permanently closed, it is well known that the lower portion of the vessel dilates in common with the branches entering into it, and that the superficial abdominal veins or azygos, or both, become enlarged, and thus carry to the heart

the blood which ought to have reached the heart by the usual course. If the obstruction is only temporary, the enlarged veins return to their original state, except that additional transverse fibres are found in the middle coat. Atrophy of the veins accompanies the corresponding changes of other tissues, when a part is permanently diseased. Amputation above the knee soon reduces the femoral vein to less than one-third of its previous size. Mr Callender, in his article on 'Diseases of the Veins,' in Holmes's *System of Surgery*, states that in the case in which a kidney became transformed into a large cyst, the canal of the renal vein was impervious to a common probe; and this condition is daily seen in the change which occurs in the umbilical vein shortly after birth.

VEINS, in Geology, are crevices, more or less vertical, caused by the contraction during drying or metamorphoses, or by the mechanical disturbance of a rock, which have been filled by materials different from the body of the rock. Veins containing substances that have been injected in a state of fusion from heat, have had their origin in some internal force; while those filled with mineral deposits may or may not be connected with upheaval. Granitic and trappean veins differ from dykes chiefly in the greater size of the latter. They produce similar changes in the rocks which they penetrate, indurating clays and sandstones, and converting limestones into marble, or giving them a compact texture like hornstone. Granite veins are generally more sinuous in their course than those of trap. One set of veins often intersects another, having been produced at a later period; and the two sets generally differ in colour, grain, and even mineral composition. Granite generally assumes a finer grain, and is even different in composition in the veins it sends into the adjoining rocks. Mineral veins are filled with different kinds of crystalline minerals. Quartz and calcite are the most common of these substances; but frequently several different minerals occur in the same vein, some of these being metallic ores. Veins of the same age are filled with the same metals, and generally maintain a general parallelism of direction. Thus, the tin and copper veins of Cornwall run nearly east and west; while the lead veins run north and south. Three kinds of veins are distinguished by the miners—Rake, Pipe, and Flat veins. The rake veins are simple crevices, crossing all the rocks of a series, generally highly inclined, and apparently formed from the contraction of the rock. The two originally opposite surfaces may retain their relative positions, only separated by the interposed contents of the veins; or a fault may place the originally contiguous surfaces at different levels; and in such a case, the intervening space between the walls of the vein are irregular, sometimes narrowing so that the walls are in contact, and then widening out, and forming large cavities containing ores. The pipe veins are irregular cavities, filled with minerals, and without any apparent connection with faults in the strata. Flat veins have a general direction corresponding with that of the stratification, and are connected sometimes with rake veins, and sometimes with pipe veins. The manner of working the minerals contained in veins is explained in the article MINING (q. v.).

VEIT, PHILIPP, a distinguished German painter, was born at Berlin, February 13, 1793. His mother, a daughter of Moses Mendelssohn, had for her second husband, Friedrich Schlegel, and V. became devotedly attached to the religious and artistic ideas of his stepfather, whom he followed in his renunciation of Protestantism for Roman Catholicism. After finishing his studies at Dresden, he proceeded to Rome in 1815, and became a prominent member of that coterie of young German painters who sought to infuse into modern art the purity and earnestness of medieval times. Of all the associates, V. ventured furthest into the obscure realms of symbolism and allegory. His first famous work was the 'Seven Years of Plenty,' executed as a companion-piece to Overbeck's 'Seven Years of Dearth,' and forming part of a series of frescoes illustrative of the history of Joseph, painted at the Villa Bartholdy in Rome. In richness and freshness of invention, it is reckoned one of the best works of the school to which it belongs. Other pictures of a high order of merit, done during his residence at Rome, are 'The Triumph of Religion' (Vatican Gallery), 'Scenes from Dante's *Paradiso*' (Massimi Villa), and an altar-piece, representing 'Mary as Queen of Heaven' in the Trinità de' Monti. These procured him so great a reputation that he was called to the Directorship of the Städelsche Art Institute, in Frankfurt-on-the-Maine. While holding this position, he produced many grand pictures, of which the most celebrated is the large fresco (at the Institute), representing 'Christianity bringing the Fine Arts to Germany,' held by many to be the finest fresco by any modern artist. Others are, 'The Two Maries at the Sepulchre,' and 'St George.' In 1843, he resigned his post as director, and removed his atelier to Sachsenhausen, in Hesse-Cassel, where he resided till his death in 1854. The most important of his later works are, 'The Ascension of the Virgin' (Frankfurt Cathedral), 'The Parable of the Good Samaritan,' 'The Egyptian Darkness,' and 'Glorification of the Christian Faith in its Alliance with the Reigning House of Prussia,' for the king of Prussia.

VELASQUEZ, DIEGO RODRIGUEZ DE SILVA, one of the most famous of Spanish painters, was born at Seville, in June 1599, of a family of Portuguese origin. Very early, the bent of nature became obvious in him; and he was sent to be educated in the studio of Francisco Herrera el Viejo, an artist of considerable force and originality. He afterwards became the pupil of Francisco Pacheco, a man accomplished in theory, but who could practically teach him little. The old pedant had, however, an attractive daughter, named Juana, who, doubtless, to the eyes of the young painter, atoned for her parent's deficiencies, and who married him at the end of five years. His chief education, however, as with all men of real genius, was that which he gave himself; he painted assiduously from the life; the models he selected were, for the most part, of the sordid peasant class, and in this way a certain habit of mind was induced, unfavourable to the attainment of that pure and elevated ideal, some infusion of which is all that is wanted to elevate the noble realistic hardihood of his manner into the very highest region of the art. In 1622, he paid a visit to Madrid, to study the treasures of art there accumulated. During his stay, he painted the portrait of the poet Gongora, and made some influential friends, at whose instance he was, the year after, invited to return by the Conde Duque de Olivarez, the favourite of Philip IV. His portrait of this magnate so delighted the king, that he himself sat to the artist, and the result was a picture of superb merit, by the public exhibition of which the artist at once became famous. The office of court-painter was bestowed upon him, and he found himself at once embarked on a full tide of the prosperity which continued through life to flow upon him. Of Philip IV. and his family he painted many pictures; and shortly after his appointment, he executed a portrait—unfortunately

lost—of the English Charles I., then (1623) at Madrid on his famous fool's errand. The year 1628 was made memorable to him by the arrival, in Madrid, of the great Rubens, on a diplomatic mission. The two artists were worthy to become friends, and speedily became so; but though Rubens, during his stay, was assiduous in the practice of his art, the familiarity of V. with his florid harmonies of colour and riot of animal vigour seems to have exercised no modifying influence on the restrained gravity and severity of his own style, now thoroughly matured.

V. had long desired to visit Italy; and in 1629, permission was granted him to proceed thither. Everywhere he was received with the highest honours; and in Rome, in particular, Pope Urban VIII. assigned him apartments in the Vatican. Here he chiefly employed himself in copying the frescoes of Raphael and Michael Angelo; and it is remarkable that, in the one or two original pictures which he at this time produced, no hint of an influence can be traced from his studies of these mighty masters. He was not the less profoundly sensible of their power; though he has left it on express record, that of all the Italians he considered Titian the greatest. Such, however, was his powerful individuality, that, his own style once formed, no such external influence was able to affect it appreciably. Having recovered from a severe illness, he proceeded to Naples; and finally, in the spring of 1631, returned to Madrid, where he was cordially welcomed by his royal patron, with whom he now became more and more a favourite. He had a painting-room in the palace assigned him; and the king was wont to come familiarly to watch him at work. It is a noble trait in the man, which deserves to be recorded along with his triumphs as an artist, that when, in 1643, the Duque de Olivarez, to whom he had been indebted whilst yet obscure, incurred disgrace at the hands of Philip, he braved the royal displeasure, by continuing to shew him in everything the respect to which he had been accustomed. In 1648, V. proceeded again to Italy, on a mission from the king to buy pictures and other works of art. He returned to Madrid in 1651; after which time many of his finest works were painted. Such was the favour in which he continued to be held by Philip, that, in 1656, the Cross of Santiago was conferred on him, an honour never before awarded except to the highest of the nobility; and shortly after, he was appointed Aposentador Mayor. This post, the duties of which consisted in attendance on the king in his journeys, and superintendence of everything essential to his convenience, was one of much honour and emolument; but it involved at times great trouble and anxiety; and on the specially important occasion of the conferences held, in 1660, to arrange the marriage between Louis XIV. and the Infanta, these were such as to utterly prostrate the painter. On July 31 of that year, he returned to Madrid, worn down with the overwork to which he had been forced to subject himself, and died in a week after, on the 7th August. He was buried with much ceremonial in the church of San Juan. His wife, who was passionately attached to him, only survived his loss about a fortnight.

V.—with the doubtful exception of Murillo—takes admitted rank as the greatest of Spanish painters. His portraits are, for force, penetration, directness, and severity of truth, of almost unrivalled merit; his historical pictures are also of rare value; his landscape effects are full of air and light; and his treatment of religious subjects only fails in defect of that deeper spirituality, the expression of which has been in its fulness attained by none save a few of the earlier Italians. The works of V. are in England rare. The two or three specimens to be found in the British National Gallery very inadequately represent his genius, of the power and variety of which a worthy conception is only to be formed at Madrid, where his finest works are preserved.

VELEZ-MALAGA, a town in the south of Spain, in the modern province of Malaga, and 16 miles east of the city of that name. It stands at the foot of a hill which forms part of the south range of the Sierra Tejada, and rises with its fortress and its spires overlooking the river Velez, at a distance of less than two miles from the shore of the Mediterranean. The climate, said by the Andalusians to be 'that of heaven,' is delightful; and owing to the abundance of moisture supplied by the hill-streams from the north, and the heat of an almost tropical sun, the vegetation of the vicinity is of the most luxuriant description. The aloe, palm, sugar-cane, prickly pear, orange, vine, olive, indigo, and sweet potato (*Batata de Malaga*), grow here abundantly. There are here the ruins of a Moorish castle, with a small tower. The town was taken from the Moors by Ferdinand the Catholic, after a long siege. Pop. 15,000.

VELIKI-LOUKI, a town of Great Russia, in the government of Pskov, on the river Lovat, 130 miles north-west of Smolensk. It is one of the most ancient towns of Russia, having belonged to Novgorod before the annexation of that territory to Moscow. Boots are largely manufactured, and exported to St Petersburg. Pop. 4797.

VELIKI-USTIUG, a trading-town of Great Russia, in the government of Vologda, at the confluence of the Jug and the Suchona, 350 miles south-east of Archangel. It was founded in the 13th c. by a colony from Novgorod. Among the branches of industry are the manufacture of small iron-ware and of linen. Pop. 7756.

VELINO, Cataract of. See Terni.

VELLE'IA, or **VELEIA**, a town of ancient Liguria, situated among the northern slopes of the Apennines, 18 miles south-by-east of Placentia (Piacenza). Little information respecting it can be gleaned from the Latin writers. The Veleiates are mentioned by Pliny among the Ligurian tribes, and seem to have been subjected to Rome in 158 B.C. The town, however, dates from the time of Tiberius, and appears, according to the traditionary account, to have been overwhelmed by a land-slip of the mountains Moria and Rovinazzo, the earth having been loosened by the percolation through it of the waters from a lake high up in the mountains. A comparison of the soil which covers the city with that of the mountains, confirms this story, though, strange to say, there is not the slightest notice in Roman history of such an event having happened. V. remained hid and forgotten till 1747, when a field-labourer turned up a tablet of bronze, on which Trajan's alimentary law for the public maintenance of 279 children was written. This tablet, which measured about 8 feet 8 inches by 5 feet 9 inches, Paris measurement, and weighed 7200 ounces, narrowly escaped being melted down for bell-metal; and in 1760, excavations were commenced by the directions of the Duke of Parma at the place where the tablet had been found. The result of these investigations, which were continued till 1765, was the discovery of a forum, in which was another bronze tablet of a smaller size than the one previously found, an amphitheatre, baths, 12 marble statues, numerous small bronze statues, medals, coins, stamps, inscriptions, and bronze instruments of various kinds. From none of the coins discovered

being of later date than the time of Probus, it has been supposed that the catastrophe which overwhelmed the city happened either during or soon after his reign. The museum at Parma contains most of the antiquities which have thus been rescued from the bowels of the earth.

For about a century previous to 1747, it was known to a very few that ancient treasures were concealed at the place where the town was subsequently discovered; and so much wealth in coins and gold statues was discovered by a poor priest belonging to the adjoining village of Macinisso, that his family became ennobled.

A few trifling excavations have been made since 1765, but they have now been discontinued for a number of years.—See *La Rovina di Veleia, misurate e disegnate da Giovanni Antolini*, &c. (Milano, 1819); and *Tavola Legislativa della Gallia Cisalpina ritrovata in Veleia, da D. Pietro di Lama* (Parma, 1820).

VELLE'TRI, a city of Southern Italy, in the Pontifical States, is walled, well built, and situated on a hill, 21 miles south-east of Rome. The principal buildings are the cathedral, an ancient Gothic structure; and the Ginetti Palace, with a marble staircase, esteemed the finest in Italy. The hill of Velletri, which, like all the country between it and Rome, exhibits evidences of volcanic action, produces good wines. Pop. 12,500.

VELLORE, India. See SUPPLEMENT in Vol. X.

VELLO'ZIA, a genus of plants of the natural order *Hæmodoraceæ*, natives of Brazil, Southern Guiana, and the Mascarene Islands. They are sometimes called *Tree Lilies*. They are perennials, with trunks closely covered by the withered remains of leaves, branching by forks, and bearing tufts of long, narrow, aloe-like leaves at the extremities of the branches. Some of them are from two to ten feet high, and the trunk is sometimes as thick as a man's body. The structure of the trunk is very remarkable. It has a slender sub-cylindrical central column, of the ordinary monocotyledonous structure, outside of which are arranged great quantities of slender fibrous roots, which cohere firmly by their own cellular surface, and form a spurious kind of wood. In some of the southern districts of Brazil, vellozias are found covering large tracts. The flowers of the larger species are about six inches long, either pure white, or of a beautiful purple colour, much resembling the white lily of our gardens.

VELLUM. See PARCHMENT.

VELO'CITY (Lat. *velox*, swift) is the common term employed to denote speed, or *rate of motion.* It is obviously greater the greater the space passed over in a given time. But, for its accurate measurement, we must distinguish between uniform and varying velocity.

Nothing is easier than the measurement of uniform velocity. It is measured by *the space passed over in a unit of time.* Thus, we speak of velocities of 10 feet per second, 20 miles per hour, &c. But, for scientific purposes, it is best to keep, as far as possible, to definite units of time and space; and those most generally convenient are the *second* and the *foot.* The latter is defined, from the imperial yard, by act of parliament; the former is usually chosen as the interval between the beats of a good mean-time clock. Unfortunately, its duration is not invariable; but, as ages must elapse before any sensible alteration takes place in its length, it may be used without inconvenience. If, then, v be the velocity of a point moving uniformly, we mean that v feet are passed over in each second; so that, if s represent the space passed over in t seconds we have

$$s = vt,$$

a formula which contains the whole properties of uniform motion. It gives

$$v = \frac{s}{t};$$

that is, to find the velocity of a moving point (when uniform), divide the space (in feet) described in *any* period of time by the number of seconds in the period. This will give the same result whether we take a million seconds or the millionth part of a second, as the period in question. This at once shews us how to proceed in measuring a variable velocity, such as that of a stone let fall, in which case the velocity constantly increases, or of a stone thrown upwards, in which case the velocity constantly diminishes.

That a moving body has, at every instant, however irregular its motion may be, a definite velocity, is obvious, and is, in fact, matter of every-day remark. Thus, when travelling in a railway train, we say, shortly after starting: 'We are now going at the rate of a mile an hour;' not thereby meaning that it will take us an hour to complete the mile, but that, *if we were to go on for an hour with the velocity we now have, we should run a mile.* Again, we may say: 'Now we are going at 30 miles an hour;' not thereby meaning that we have so much as 30 miles to travel, or that our journey is to last more than perhaps a few minutes, but that *an hour at the present rate would take us* 30 *miles.* In common language, then, our question is, how to measure our present rate.

If we could at any instant so adjust the steam-power to the resistance of the air and the friction of the rails as to keep the rate unaltered, we should have uniform velocity, measurable with ease, as above shewn. But, as we cannot generally do this (though Attwood's machine enables us to do it in the case of a falling body), we are driven to some other expedient. Now, it is obvious that the smaller the interval we take, the less will our velocity have changed during its lapse, i. e., the more nearly will it have become uniform and measurable by the simple formula given above. That is for a variable velocity we have

$$v = \frac{s}{t}$$

as an approximation, which is more and more nearly true as t, and therefore s, is smaller. In the language of the differential calculus—whose fundamental notions, as laid down by its great inventor, were, in fact, derived from this very question, the velocity being simply the *Fluxion* (q. v.) of the space described—we have

$$v = \frac{ds}{dt}.$$

Practically, by means of the electric chronoscope, we can now measure (very exactly) extremely small intervals of time, such, for instance, as the interval between the fall of the dog-head and the exit of the bullet from a rifle-barrel; so that a variable velocity now presents no formidable difficulty, as we can study and measure it *while it is almost absolutely uniform.*

We define *average* velocity as the space described in any time divided by the number of seconds employed. This may not, except at one or more instants during the motion, represent the actual velocity; but it is a velocity with which, if uniform the same space would have been described in the same time. We shall presently have an opportunity of usefully applying this definition to one interesting case of varying velocity.

The *resolution* and *composition* of simultaneous velocities follow, almost intuitively, from the most elementary geometrical notions. When a man is walking north-east at a uniform rate, it is obvious to common-sense that he is progressing northwards, and also eastwards. What is his northward, and what his eastward velocity? The answer is very simple. Suppose that in one second he walks from A to B, then AB represents his whole velocity. But draw AN northwards, and AE eastwards; also draw BC parallel to AN. Then AC is the space by which B is eastward of A, BC the space by which it is northward. Hence AC represents the eastward, and CB the northward velocity (each being the space in its respective direction described in one second), and these are called *components* of the velocity AB. AB, again, is said to be *resolved* into AC and CB.

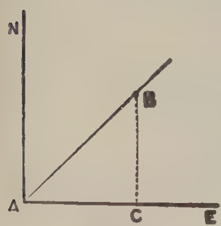


Fig. 1.

The general proposition is this, that a velocity represented by one side of a triangle may be resolved into two, represented in magnitude and direction by the other sides of the triangle. One or both of these may be again resolved by a similar process; and we find, as the most general propositions on the subject, that velocities represented by all the sides of a polygon (whether in one plane or not) but one, taken in the same order round, are jointly equivalent to a velocity represented by that one side, taken in the *opposite* order; also that a point which has, simultaneously, velocities represented by the successive sides of any polygon, taken all in the same order round, *is at rest.* The second law of motion (see MOTION, LAWS OF) enables us to interpret this geometrical theorem into the Physical Truths known as the Triangle and Polygon of Forces in Statics.

Rate of change of velocity is called *Acceleration.* It is measured in the same way as velocity itself. Thus, if the change take place in the direction of motion, it affects merely the amount, not the direction, of the velocity; and an acceleration α adds (or subtracts, if it be negative) α feet per second from the velocity affected. Thus it is found that gravity produces an acceleration of about 32·2 on all falling bodies; so that if a stone be let fall, its velocity after t seconds is $32{\cdot}2t$. If it be *thrown* down with a velocity v, its velocity in t seconds is $v + 32{\cdot}2t$. If thrown upwards with the same velocity, in t seconds its velocity becomes $v - 32{\cdot}2t$, so that it will stop and begin to descend after $\frac{v}{32{\cdot}2}$ seconds have elapsed.

The space passed over by the stone in t seconds is easily calculated by the help of the *average* velocity. For, since in any of the above cases the velocity increases (or diminishes) *uniformly*, its average value during any interval is the average of its values at the beginning and end of the interval. Hence, for the stone simply let fall:

Initial velocity $= 0$,

Velocity after t seconds $= 32{\cdot}2t$,

Average velocity during the first t seconds $= 16{\cdot}1t$.

Hence, space described in t seconds

$$= t \times \text{average velocity} = 16{\cdot}1t^2.$$

So that the spaces described are as the *squares* of the times.

But, if the acceleration be not in the direction of motion, the direction as well as the magnitude of the velocity will generally change. To exhibit this geometrically, Hamilton (q. v.) invented the following beautiful construction of what he called the Hodograph of the motion. Let O be any fixed point, and from it draw lines OP, OQ, &c., representing, at every instant, in direction and magnitude the velocity of the moving point. The extremities of such lines will form a curve, such as PQ in the figure. If OP and OQ be any two of these, the *change* of velocity is represented (as above) by the third side, PQ, of the triangle. As Q is taken nearer and nearer to P, PQ becomes more and more nearly the tangent to the hodograph, so that the tangent at P has the *direction* of the acceleration, and the rate at which P moves round the hodograph is the *magnitude* of the acceleration.

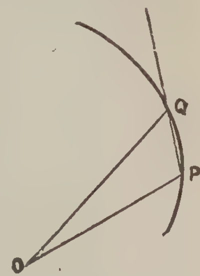

Fig. 2.

If we consider any uniform motion, we see that the hodograph is a circle (its radius being the magnitude of the velocity), and from this it is easy to see that *in uniform motion the acceleration is always perpendicular to the direction of motion.* If we consider uniform motion, with velocity V, in a circle of radius R, the hodograph at once shews that the acceleration is $\frac{V^2}{R}$, and is directed towards the centre of the circle.

Translated into Physics, acceleration (multiplied by the mass of the moving body) is the measure of the force which acts on the body. So the above simple example shews that, to keep a mass moving uniformly in a circle, it must be drawn towards the centre by a force proportional directly to the square of the velocity, and inversely to the radius. This is the physical explanation of the so-called Centrifugal Force (see CENTRAL FORCES).

VELOCITY, INITIAL, in Gunnery, is the speed with which the ball leaves the muzzle of the gun. This was formerly calculated from the momentum, as shewn by the Ballistic Pendulum (q. v.). A great improvement of the last ten years is the Electro-ballistic Pendulum, the invention of a Major Navez of the Belgian service, which actually measures the interval of time during which the shot traverses a short space of ground. The apparatus consists of a steel pendulum falling at the side of a graduated sector of a circle. Behind the segment is a piece of iron capable of being magnetised by a galvanic battery adjoining. The wires for completing the circuit between the battery and the magnet are so arranged that they are in connection with two targets of paper or other thin material in the line of the projectile's fire. So long as the circuit is complete, and before the experiment, the magnet holds the pendulum at its highest point. When the shot pierces the first target, the circuit is broken, the iron demagnetised, and the pendulum released; these effects being absolutely simultaneous. With equal simultaneity, the piercing the second target re-establishes the circuit, magnetises the iron, and arrests the pendulum in its descent. The distance between the targets is known, and the accumulating resistance of the atmosphere within that time; the sector being finely graduated, the distance traversed by the pendulum shews exactly the fraction of a second occupied, and from these data the initial velocity is a matter of simple computation. Of an ordinary smooth-bore cannon, the initial velocity is about 1600 feet per second.

VELOCITY, VIRTUAL. See WORK.

VE'LVET, a fabric in which, beside the ordinary

warp and weft, which are usually arranged as in plain-weaving, there is also a supplementary weft, consisting of short pieces of silk, cotton, or woollen thread doubled under the regular weft, and brought to the surface in loops which are so close together as to conceal the regular web. The loops are afterwards cut evenly, and the ends thus made constitute a covering resembling a very short fur. In silk velvets, the warp and pile threads are both of organzine silk, which is the strongest used in weaving.

VE'NDACE (*Coregonus Willughbii* or *marænula:* see COREGONUS), a fish of the family *Salmonidæ*, found in the rivers and lakes of Sweden, in the Castle Loch at Lochmaben in Scotland, and in some of the English lakes. It is popularly said to have been introduced at Lochmaben by Queen Mary; but the statement rests on no authority, and is highly improbable, as the fish could not be easily transported, except by the roe, living only for a very short time after being taken out of the water. Like most of its congeners, it is highly esteemed for the table. Its food consists chiefly of *Entomostraca*, and it is never taken by angling.

Vendace (*Coregonus marænula*).

Sweep-nets are used for its capture. It generally swims in considerable shoals, often with a remarkable separation of the sexes. It attains a length of 6 or 7 inches, is deeper in proportion than many of the Salmonidæ, and of a compressed form. The outline rises quickly from the snout to the dorsal fin, and the body tapers rather suddenly at the tail. The under-jaw projects a little. The scales are of moderate size, and do not come off very readily. The tail is broadly forked. The back is brown, the sides tinged with yellow, the cheeks partly white, and there is a curious, red, heart-shaped mark between the eyes. It spawns in November and December, and multiplies rapidly, notwithstanding the presence of predaceous fishes in the waters which it inhabits. V.-fishing at Lochmaben takes place only on the 1st of August each year. The V. might probably be introduced with advantage into many of the British lakes. It is doubtful if this fish is the same with the *Coregonus albulus*, found in Pomerania.

VENDÉE, LA, a maritime dep. in the west of France, bounded on the W. by the Bay of Biscay, on the N. by the dep. of Loire-Inférieure, and on the S. by that of Charente-Inférieure. Area, 2587 sq. m.; pop. (1881) 421,642. The dep., which owes its name to a small affluent of the Charente, is traversed from east to west by a range of hills, called in the east the Plateau de Gatin, and in the west the Collines Nantaises; and is watered in the north by the affluents of the Loire, and in the south by the Lay and the affluents of the Charente. The territory of La V. is divided into three parts, the names of which indicate the character of their configuration. In the west is the *Marais*, occupied by salt marshes and lakes; in the north is the *Bocage*, covered with plantations; in the south and middle is the *Plaine*, an open and fertile tract. The coast-line, 93 miles in length, presents few deep indentations, the chief being the Bay of Aiguillon, which affords secure anchorage for vessels. The climate is warm, humid, and unhealthy in the *Marais*, cold and humid in the *Bocage*, and warm, dry, and healthy in the *Plaine*. Cereals, potatoes, and vegetables are largely cultivated; the wine produced, which is white and of inferior quality, amounts to 5,500,000 gallons a year. Among the mineral treasures, iron ore is very abundant. There are three arrondissements—Napoléon-Vendée, Fontenay-le-Comte, and Sables-d'Olonne. The capital is Napoléon-Vendée.—For the *wars of La V.* (by which name the armed opposition to the religious and political changes in France is denoted, and which burst out into a species of partisan warfare in 1793, 1794—1795, 1799, and 1815), see CATHELINEAU, LAROCHEJACQUELEIN, HOCHE, CHOUANS, &c.

VENDÉMIAIRE (i.e., the 'Wine-month') embraced, in the calendar of the first French Republic, the period from the 23d September to the 21st October. Particularly memorable in the history of the Revolution is the 13th Vendémiaire of the year IV. (5th October 1795), when the Paris 'Sections,' worked upon by royalist reactionaries in all sorts of ways, rose against the National Convention, but were decisively beaten by a military force under the command of Barras, or rather of his lieutenant, Napoleon Bonaparte, then a young officer only beginning to be known. The victory of the Convention saved the Republic—for a time.

VENDE'TTA (vengeance), the term used to denote the practice, as it prevails in Corsica, of individuals taking private vengeance upon those who have shed the blood of their relations. In Corsica, when a murder has been committed, the murderer is pursued not only by the officers of justice whose duty it is to punish offences against society, but also by the relatives of the slain, upon whom the received views of social duty impose the obligation of personally revenging his death. In such a case, the relatives of the murdered man take up their arms, and hasten to pursue, and if they can find him, to slay, the murderer. If he succeed in eluding their pursuit, the murder may be revenged upon his relatives; and as the vengeance may be taken whenever an opportunity occurs, the relatives of a murderer whose crime is unavenged have to live in a state of incessant precaution. When they go to the fields, they take their arms with them, and set a watch; at home, they have their doors well fastened, and their windows barricaded; and since the avenger is never far distant, they live, in fact, in a state of siege. Instances are on record of persons who were, as the phrase is, 'suffering the vendetta,' having lived shut up in their houses for 10 or 15 years, and being, after all, shot on the first occasion on which they ventured out of doors. Formerly, when blood had been shed, there was a custom of proclaiming the war of revenge, and announcing to what degree of relationship it should extend; but this custom is gone out of use. Frequently, in the practice of this system of vengeance, each of two sets of relatives has a murder to revenge upon the other; the vendetta, that is, crosses. This is called the *vendetta transversale*. The duty of taking vengeance lies primarily and especially upon the next of kin. Not to take revenge is deemed in the highest degree dishonourable; and any delay in doing so on the part of the next of kin is made matter of reproach by his relatives. When the Genoese were masters of the island, their laws declared the *rimbicco*—the uttering of such reproaches—punishable

as an incitement to murder. But there is seldom occasion for the rimbicco, for the Corsican is brought up to regard the vendetta as the most sacred duty of man. The women instigate the men to revenge by singing songs of vengeance over the body of the slain, and displaying his blood-stained garments. Often a mother affixes to her son's dress a bloody shred from the dead man's shirt, that he may have a constant reminder of the duty of taking vengeance. Although the vendetta usually has its origin in bloodshed, smaller injuries may give rise to it, and even purely casual occurrences. Mediators, termed *paroianti*, often interpose to make up a quarrel. When they succeed, an oath of reconcilement is taken, and this oath is regarded as specially binding. It is infamous to break it; nevertheless, it is broken now and then. Brigandage prevails to a great extent in Corsica, and the origin of the career of a brigand, in almost every instance, can be traced to the vendetta. A man commits a murder out of vengeance; he flees to the hills; it never is safe for him to resume his former life again, and so he turns robber for a living. Besides the vendetta, properly so called, hereditary family feuds are very common in Corsica; and sometimes there are hereditary feuds between whole villages. The great families of the island hand down feuds from generation to generation, in which not only themselves and all their relatives, but all their servants and dependants are involved—the kind of feud which was common in the Italian towns of the middle ages, and which is illustrated in the play of *Romeo and Juliet*.

The origin of the vendetta has often been referred to the lawlessness which prevailed in many parts of Corsica during the period of the Genoese domination, and to the venality which vitiated the Genoese administration of justice. And, no doubt, the insecurity and the mal-administration of justice which existed in Corsica for ages, helped to consolidate this barbarous custom; which, thus consolidated, has been perpetuated by the isolated position of the country, and the absence of civilising influences. But the explanation of its origin must be sought in more general causes, for it is not exclusively a Corsican custom. On the contrary, it may be safely affirmed that a system of private vengeance, almost precisely similar, has existed amongst every people during certain stages of its progress—never entirely passing away until government became strong enough to insure redress of injuries, and to restrain the passions of individuals.

In the case of rude tribes, in the savage or semi-savage state, there is on record such a multitude of instances of the existence of the blood-feud, that its universality among men in that state cannot be doubted. Its incidents are usually the same which Sir G. Grey found subsisting among the aborigines of Australia, and of which, in his *Journals of Travel in the North-west of Australia*, he has given a vivid description. The Australian tribe usually includes several stocks or bodies of men, between whom blood-relationship is acknowledged; and every member of a stock is bound to assist in taking vengeance for a personal injury done to any of his kinsmen. On the other hand, though a hunt is always made for the actual wrong-doer, the injury may be satisfactorily avenged upon any member of his stock. As in the Australian and similar tribes, there is no relationship acknowledged between members of the same family unless they are also members of the same stock (see article TRIBE), the blood-feud occasionally arrays father against son, and brother against brother. It often leads to the break-up of a tribe.

Of the prevalence of the blood-feud among tribes which have advanced to what is called the patriarchal state also, there is very ample evidence. Among such tribes, the cohesion of the family is very powerful; everything relating to the family is quasi-sacred; and the duty of taking vengeance for kindred blood is not merely a matter of honour, but of religion. Volney's description of the blood-feud, as practised among the Bedouins, will do for all the tribes of this class; and it might almost stand for a description of the vendetta. 'The interest of the common safety,' he says, 'has for ages established a law among them (the Bedouins) which decrees that the blood of every man who is slain must be avenged by that of his murderer. This vengeance is called *Tar*, or retaliation; and the right of exacting it devolves upon the nearest of kin to the deceased. So nice are the Arabs upon this point of honour, that if any one neglects to seek his retaliation, he is disgraced for ever. He therefore watches every opportunity of revenge; if his enemy perishes from any other cause, still he is not satisfied. His vengeance is directed against the nearest relation. These animosities are transmitted as an inheritance from father to children, and never cease but by the extinction of one of the families, unless they agree to sacrifice the criminal, or purchase the blood for a stated price in money or in flocks. Without this satisfaction, there is neither peace, nor truce, nor alliance between them, nor sometimes even between whole tribes. The blood-feud is observed, almost precisely as described above, among the Circassians, the Druses, and the numerous hordes of Central Asia; it seems to have had the same incidents, too, among similar tribes in ancient times—e. g., among the Greeks of the Homeric period, among the Germans in the time of Tacitus, among the northern nations who overran Europe after the fall of the Roman Empire. The Corsican vendetta seems to be the same thing as the Bedouin Tar, surviving, with slight modifications, in a secluded island, where the law has never made itself supreme, long ages after the progress of society and the consolidation of government have effaced every trace of it, except at a few isolated points on the neighbouring continent of Europe. The vendetta exists in Sicily and in Sardinia, as well as in Corsica; in Calabria also; and it (or we should rather say, the blood-feud) flourishes vigorously among the Montenegrins and the Albanians.

The right of private war which subsisted in Europe in the middle ages—introduced by the northern nations who shared the spoils of the Roman Empire—was just a modification of the blood-feud. This right belonged only to the nobility, and could be exercised only against men of equal rank. It was usually resorted to on account of insults publicly done, of atrocious acts of violence or bloodshed, and similar injuries. The right of vengeance devolved first upon the next of kin; but all the kindred within the degrees of relationship to which the ecclesiastical prohibitions of marriage extended, were bound to take up the quarrel; and this obligation was so far sanctioned by law, that if any one failed to fulfil it, he was deemed to have renounced his kindredship, and to have lost his rights of succession. Vassals, equally with kinsmen, became implicated in the vengeance of their lords; and every person present when the cause of quarrel arose was required to take side with one or other of the parties. For several centuries, private wars were constantly being waged within the kingdoms of the continent, and the efforts of kings and ecclesiastics to restrain them produced little effect until governments became strong enough to prohibit them, and to enforce the prohibition.

It is now apparent that the vendetta represents a system which prevailed everywhere before the

consolidation of society into the state, and the establishment of a police capable of protecting life and property. This system was a rude substitute for government and the administration of justice. The family, or the body of kindred, formed, in fact, a commonwealth of itself; its members held firmly together; and when one was injured, all the little state was injured. The Nagas have no government, and among them the blood-feud is the only check—it is not altogether inefficient—upon the selfishness and the passions of individuals. As society became consolidated, the exercise of this right of vengeance was curtailed—remaining longest with the nobility, who counted it as one of their most valuable privileges, and maintained it as long as possible. They had to surrender it at last, because the state grew strong enough to supersede the action of individuals in redressing injuries, and was able to do this with greater fairness, and without the same admixture of calamitous results.

VENDOME, House of. V. was an old county of France, erected into a duchy by Francis I., for behoof of Charles of Bourbon, the grandfather of Henry IV. On the accession of the Bourbons to the throne, it was reunited to the crown, but again separated from it by Henry IV., who conferred it upon Cesar, the eldest of his sons by Gabrielle d'Estrées. Cesar's eldest son, Louis, Duke of Vendome, married Laura Mancini,* one of Mazarin's nieces, and had by her three sons, the eldest of whom was Louis-Joseph, Duke of Vendome, the celebrated French general who so distinguished himself during the war of the Spanish Succession. He was born at Paris, July 1, 1654, and made his first appearance on the field of battle as a lifeguardsman during the Dutch campaign of 1672, afterwards serving with distinction under Turenne in Germany and Alsace, and under Crequi in Flanders. Released by the peace of Nimeguen (1678), he retired to his château of Anet, near Dreux, where he resigned himself to the most liberal indulgence in all kinds of pleasure. At this time, he became compromised in the affair of Lavoisin (see Poisoning); but it turned out that his intercourse with the pretended seer was prompted merely by curiosity. On the outbreak of war in 1688, he was ordered to the Low Countries, where, under Luxembourg (q. v.), he earned deserved renown at the sieges of Mons and Namur, and the battles of Leuse and Steenkerk; and his high reputation was not diminished by his subsequent conduct in Italy, where he commanded the left wing of Catinat's army at the battle of Marsaglia (October 4, 1693). But V.'s brilliant gallantry and military talents had not hitherto succeeded in obtaining for him the honour of an independent command, for it was only too evident that with these valuable qualities were combined inveterate indolence, and careless and disorderly habits, which might, as effectually as the most utter incapacity, ruin the chances of any enterprise under his management. However, the necessities of the case induced Louis ultimately to give him (1695) the command of the army in Catalonia; and he was agreeably surprised at the alertness of V., who closed a series of brilliant successes by the capture of Barcelona, an exploit which did much to bring about the peace of Ryswick (1697). After five years of inaction, spent in sloth and sensuality, he was despatched by his sovereign to supersede Villeroy in Italy. His arrival was hailed enthusiastically by the soldiery, who relied implicitly upon his brilliant genius and happy audacity to extricate them from all difficulties, and with whom his excessive laxity in the matter of discipline rendered him a great favourite. The restored confidence of the troops was proved by the victories of Ustiano and San-Vittoria; while the enforced retirement of Prince Eugene beyond the Mincio equally shewed the superior strategic abilities of their general; and it required the utmost exercise of both to prevent the surprise at Luzzara (August 15, 1702), brought about through V.'s usual carelessness, from becoming a total rout. From this time, a slight though temporary improvement in V.'s habits is visible; in 1703, he drove the Austrians before him into the Tyrol, repeatedly defeating Starhemberg; when the defection of the Duke of Savoy forced him to retreat. The duke, though joined by Starhemberg, was beaten again and again, and at last cooped up in Turin, whither Eugene was advancing to his relief, when the defeat of his advanced guard by V. compelled a halt. The imprudent Frenchman, however, intrusted the difficult duty of holding Eugene in check to his younger brother, the grand-prior, who, though a gallant soldier, was no match for his opponent in generalship; and had not V. returned to Cassano just in time to divide the honours of the battlefield with his opponent, the army of observation would have been scattered to the four winds of heaven. Again, partially stimulated by this narrow escape, V. displayed unwonted vigour, and drove the Austrians into the Trentin; but in the summer of 1706, he was recalled to supersede Villeroy, who had blundered in the Low Countries, as he had formerly done in Italy. Unfortunately, V.'s besetting faults were attempted to be remedied by uniting the Duke of Burgundy with him in command; and the want of a thorough understanding between the conjoint chiefs led to the defeat of the French at Oudenarde (q. v.), and to the failure of the attempt to relieve Lille. The cause of these reverses formed the subject of vehement discussions in France, and though undoubtedly V. was mostly to blame, his great reputation gained him the public support; yet Louis XIV. held him in a sort of disgrace for a time. In 1710, a cry of distress arose from Spain, where the British and Austrians were carrying all before them; and in compliance with the urgent request of Philip V. (who had served under V. in Italy) to his grandfather to send him—not a reinforcement, but only V., the heroic old debauchee was once more roused up from his lair, and despatched to Spain. His appearance, like that of Du Guesclin more than three centuries before, brought together as if by magic a numerous army of volunteers; towns, villages, and even religious establishments united in a most enthusiastic manner to contribute the necessary funds, and Philip was settled in his capital before the close of the year. A week after, Stanhope and the British troops were defeated and captured at Brihuega; and on the following day, Starhemberg and the Austrians were completely routed at Villa Viciosa. The grateful monarch raised his deliverer to the rank of a prince of the blood-royal, and presented him with 500,000 livres (£20,000), a gift which V. accepted only to distribute it among his soldiers. V. for the last time relapsed into his usual habits, and after 'a month of extraordinary gluttony,' died of indigestion at Vinaroz in Valencia, June 15, 1712. V., of all the descendants of Henry IV. both then and since, bears the strongest resemblance to his great-grandfather; but of the resolute persistency and self-denial of the first and greatest of the Bourbon monarchs, we cannot discern in him

* It is curious to remark the relationship between the opposing leaders in the great war of 1700—1713. Vendome (French) and Prince Eugene (Allied) were cousins; Vendome was second cousin to the Duke of Burgundy; Eugene was similarly related to the Duke of Savoy; and Marlborough (Allied) and Berwick (French) were uncle and nephew.

the slightest trace.—Saint-Simon's biography of V., and Voltaire's *Siècle de Louis XIV.*, are the principal authorities for the life of this extraordinary man.

V.'s disinterestedness, like his other good qualities, and they were not a few, became a vice from its very extravagance. It is related that one of his domestics demanded permission to leave his service on the ground that he could not stand by to see a master robbed by his servants in such a barefaced way. 'Is that the reason?' said V.; 'very well, then, rob like the others.'

VENDOME, a town of France, in the dep. of Loir-et-Cher, seated on vine-clad hills, on the Loir, which here divides itself into many canals, 45 miles west-south-west of Orleans. It contains cavalry barracks; a theatre; the church of the Trinity, a remarkable edifice; one of the most beautiful colleges of France; and the ruins of a lofty castle. Manufactures of cloths, needles, and embroideries are carried on with activity. Pop. 9400.

V., a very ancient town, and said to have been of importance under the Merovingians, was the capital of the ancient county of Vendomois, which was erected into a duchy-peerage by Francis I., in favour of Charles de Bourbon. Henry IV. conferred it on one of his natural sons, who thus became the founder of the House of Vendome. The county is now represented by the departments of Loir-et-Cher and Sarthe.

VENEE'R (Fr. *fournir*, to furnish), a layer of wood, cut very thin, for the purpose of being glued on to the surface of a commoner kind. Only choice kinds of hard woods are sawn into veneers, and they are usually attached to deal or pine, so as to give all the appearance of being made solid. In this way, the more costly kinds of furniture-woods are economically used by the cabinetmaker, for with the improvements which have been effected in the process of sawing, veneers as thin as paper have been produced.

VENE'REAL DISEASE. See SYPHILIS.

VENE'RIDÆ, a family of lamellibranchiate molluscs, having a regular, closed, bivalve shell; the teeth and laminæ of the hinge near together in a single group under the beak (*umbo*); generally three diverging teeth in each valve; a marked oval impression in front of the beak; the general form similar to that of the cockles (*Cardiaceæ*), but usually more flattened. The mantle has a large opening in front; the siphons are unequal, more or less united; the foot is tongue-shaped, compressed, sometimes grooved, and producing a Byssus (q. v.). The species, all of which belong to the Linnæan genus *Venus*, are very numerous. They are very widely distributed, but abound chiefly in tropical seas. About forty are found on the British coasts, some of them very common. The V. are generally elegant in form, and often finely coloured. Some of them have the shell furnished with long spines, but chevron-shaped lines are their common ornament. The V. first appear in the oolitic rocks, and are more abundant in the present than in any former geological epoch.

VENESE'CTION (occasionally termed PHLEBOTOMY, and popularly known as BLOOD-LETTING or BLEEDING) is an incision into a vein, for the abstraction of blood. Although the operation may be performed on many of the superficial veins, it is restricted in this country to the veins at the bend of the elbow. Of these veins, the most prominent are the median-cephalic and the median-basilic; the former being situated on the outer side of the tendon of the biceps muscle, while the latter lies on the inner side, and only separated from the brachial artery by a thin layer of fascia. Hence, from fear of wounding the artery, the median-cephalic should be preferred; but in reality the median-basilic is usually selected, in consequence of its being the more prominent and larger vein of the two. The appliances required are a lancet, a bleeding-tape or narrow bandage, lint, a bowl to receive the blood, a basin of water, and a sponge. The patient being placed in a sitting position, the tape or bandage must be tied sufficiently tight around the middle of the upper arm, or rather lower, to arrest the venous circulation without materially affecting the pulse at the wrist. The forearm having been allowed to hang down till the veins are tense, the operator must make his selection, and taking the blade of the lancet between the forefinger and thumb of the right hand, should fix the vein by pressing his left thumb upon it just below the part he is about to open. Steadying his hand by resting the ends of the three outer fingers on the forearm, he should steadily (and without a jerk or plunge) introduce the point of the lancet obliquely until the interior of the vessel is reached, and the blood is seen rising up. Without penetrating deeper, he should thrust the instrument forward, so as to open the vein longitudinally to a sufficient extent. On now removing the thumb, the blood should emerge in a full jet; and if the stream be scanty, the patient may have a hard body—as a piece of stick or a pocket-knife—placed in his hand, with directions to grasp it firmly, or the surgeon may increase the flow by chafing the palmar surface of the forearm, rubbing from below upwards. When a sufficient quantity of blood has been abstracted, the thumb of the left hand should be placed on the wound, and the ligament loosened; a small pad of lint should then be placed over the orifice, the surrounding parts should be cleaned of blood by a sponge, and the pad of lint compressed against the arm by the tape or narrow bandage, applied in the figure-of-eight form, with the crossing of the tape lying on the pad. After the operation, the arm should be carried in a sling for a day or two. We have, contrary to our ordinary custom, given the details of the operation, because it is one which, if performed at the proper moment, may be the means of preserving life, and which any person of ordinary intelligence could probably perform more safely, after reading these directions, than the farriers, barbers, &c. who are frequently called upon to perform it in remote country districts and in the backwoods of the colonies. Amongst the occasional ill consequences of venesection may be mentioned: (1) The escape of blood into the surrounding cellular (or connective) tissue, giving rise to a swelling called a *Thrombus*, which, if it does not rapidly become absorbed, should be emptied by the lancet. This is due to a want of coincidence between the wound in the integument and in the coats of the vein. (2) Phlebitis, which generally arises from the use of an unclean lancet. (3) Varicose aneurism and (4) Aneurismal varix, both of which may be included under the term Arterio-venous Aneurism, since in each case there is an aneurismal dilatation of an artery communicating with a vein; while they differ in this respect, that varicose aneurism is said to exist when an artery has been punctured through a vein (in this case, the brachial artery through the median-basilic vein), and a false or traumatic aneurism, composed of lymph that was effused between the vessels, has formed between them, and opens into both; while aneurismal varix is similarly produced, but the two vessels adhere together, the communication between them remaining permanent. These diseases often have such a tendency to remain stationary, that no interference is necessary; occasionally, however, very serious

surgical treatment is required, for details of which we may refer to that excellent article on 'Aneurism,' in Holmes's *System of Surgery.*

In children, and occasionally in others, where the veins of the arm are small and undefined, blood is drawn from the external jugular veins. As this operation would only be performed by a surgeon, it is unnecessary to describe it; and we will merely remark, that as the entrance of air into the vein during the operation, or until the orifice of the vein has been closed, would cause instant death,* this vein should only be opened in extreme cases.

We have no space to notice at any length the general results of bleeding, or the much disputed question, whether venesection should not be discarded from our list of operations,† because no rational doubt can be entertained that, although, until a quarter of a century ago, or later, there was a most unnecessary and probably hurtful effusion of blood, venesection, in properly selected cases, is one of the most valuable remedies. A patient can bear a much greater loss of blood in the horizontal position than when sitting, and in that position than when standing. The condition required to be produced is that there should be incipient faintness; and the loss required to produce this effect varies extremely in different individuals and in different diseases. The late Dr Marshall Hall, in his work *On the Effects of the Loss of Blood*, states that the average loss of blood required to produce slight faintness in a healthy person in the sitting position is 15 ounces. In some diseases, more, and in others less, than this loss can be borne. The greatest loss can be borne in congestion of the head, or tendency to apoplexy (from 50 to 40 ounces); then in inflammation of the serous membranes and of the parenchymatous substance of various organs (from 40 to 30 ounces); then acute anasarca (about 20 ounces); and then inflammation of the mucous membranes (about 16 ounces); while the system bears less than the quantity borne in health, in the eruptive and other fevers, in delirium tremens, dyspepsia, and chlorosis—a set of diseases in which blood-letting is now scarcely ever resorted to.

VENETIAN CHALK, a variety of soap-stone or steatite, used sometimes in the manufacture of drawing crayons.

VENETIAN STYLE of Architecture. This term is applied to the particular phase of the Renaissance developed in Venice. Under the head Italian Architecture, the peculiarities of the various schools of Italian architecture are pointed out. The Venetian is the most picturesque and ornate, as compared with the styles of Rome and Florence. 'Venetian-Gothic' indicates the peculiar phase of that style so common in Venice and the north of Italy, and chiefly applied to domestic architecture. See Gothic Architecture.

VENEZUELA, a republic in the north-west of South America, bounded on the N. by the Caribbean Sea, on the W. by the United States of Colombia (New Granada), on the S. by Brazil, and on the E. by British Guiana. Lat. 1° 20′—12° 25′ N.; long. 59° 45′—73° 17′ W. Within recent years, the country has been variously subdivided. In 1869, there were 13 provinces—those of Apure, Barcelona, Barinas, Barquisimeto, Carabobo, Caracas, Coro, Cumana, Guiana, Maracaybo, Margarita, Merida, and Truxillo—with an aggregate population of 945,408. At a former period, the number of provinces was increased to 21, by subdividing 8 of the original provinces. In 1863, after the Federals had conquered the Unionists, a confederation was formed, and the number of the states was to be reduced to 7. But later, in March 1865, the states were reported to be 20 in number (*Almanach de Gotha*, 1866). The number of states is at present 13; the area of the country is known to be 368,235 sq. m.; the pop., according to the latest enumeration, is 1,564,433. The coast-line, extending from east to west—from the delta of the Orinoco to the boundary of the United States of Colombia—is 1584 miles in length. The most easterly part of the coast-line, 150 miles in length, and formed mostly by the delta, is washed by the Atlantic, and is very low. The waters of the Gulf of Paria beat upon bold and rocky shores. The remainder of the coast-line, including the north shore of the peninsula of Paria, is washed by the Caribbean Sea, and the coast, for the most part low and marshy, is sometimes precipitous, the mountains rising like a wall from the water's edge. With trifling exceptions, the country is abundantly watered. Its great river is the Orinoco, which drains by far the greater part of it, and the course of which is almost wholly within its boundaries. The other greater rivers of V. are affluents of the Orinoco (q. v.). Numerous streams, small in comparison with the great rivers, flow north into the Caribbean Sea and the Lake of Maracaybo (q. v.), which is by far the largest lake in the country. The Andes enter V. from the west, and divide into two branches, the first of which runs north toward the coast, under the names of the Sierra de Perija and the Montes de Oca, but rise no higher than 4200 feet; while the other branch, running in a north-east direction, terminates near the coast, in long. 68° 30′ W., and attains a much greater elevation. That part of the north-east branch of the Andes called the Sierra Nevada de Merida, and situated about 100 miles south of Lake Maracaybo, contains the only mountain that rises above the line of perpetual snow, and the two peaks of which are 15,342 and 15,310 feet high respectively, the loftiest in the country. South and south-east of the Orinoco, are the most mountainous districts of Venezuela. They form a vast, confused, and mostly unexplored region, but none of these mountains rise to the height of the main peaks of the Andes. The country embraces vast table-lands, known under the names of *Llanos, Paramos, Mesas*, and *Punos*. There are extensive, low, marshy tracts along the coasts and the lake and river banks, which, however, are abundantly fertile during the dry season. For the most part, the soil of the country is fertile. In the mountainous district in the south-east, there are great tracts well suited for the production of grain. Of this region, the lands not more than 2000 feet above sea-level are called *tierras calidas*, or hot lands; those between 2000 and 7000 feet are called *tierras templadas*, temperate lands; and those above 7000 feet are the *tierras frias*, cold lands, in which the average temperature is 49° F., and which are mostly uninhabited. The warmest tracts are the palm-lands; and the sago-palm, cocoa-palm, and others, grow here to a most colossal size, and yield most valuable products. Among the forest trees are the mahogany, satin-wood, rosewood, black and white ebony, and caoutchouc; and there are forests of

* Few deaths are more rapid than those caused by the entrance of air into the veins of the neck. Many surgical operations in that region have proved fatal from this cause; and the knowledge of this fact has been applied to the slaughtering of horses, oxen, &c. It is probably one of the most humane forms of destroying life.

† On this subject, the non-professional reader may consult a long foot-note to Dr (now Sir Thomas) Watson's *Lectures on the Principles and Practice of Physic*, 4th ed., vol. i. pp. 231—234; and Dr Markham's *Lectures on the Change of Type in Disease; with a Letter by Sir Thomas Watson*, 1866.

the cinchona or Peruvian-bark tree. The cocoa and coffee trees, sugar-cane, indigo, and cotton plants are cultivated. Vegetables in great variety are raised, and tobacco is a profitable crop. Among the wild animals are the puma, ounce, and wild-cat; the jaguar is now becoming rare. The alligator, crocodile, boa-constrictor, and rattlesnake are found. Of domestic animals, great herds of cattle and wild-horses roam over the *llanos*, and mules, asses, sheep, goats, and pigs are reared. The inhabitants are made up of whites of Spanish extraction; Indians, who are docile and industrious, and are the miners, agriculturists, and manufacturers of the country; some negroes and mixed races. Agriculture is the great pursuit, though only about one-tenth of the whole area is under cultivation. Manufactures are few; commerce is important, and would be much more so, were there well-constructed roads and other means of conveyance than mules. The principal articles of export are coffee, cotton, cocoa, sugar, indigo, tobacco, salt, hides, live-stock, tallow, horns, sarsaparilla, dye-woods, and timber. The imports are manufactured goods, provisions, and wine. During the years 1865—1869 the total imports averaged $5,000,000, and the exports about $6,000,000, per annum. The religion of the mass of the people is Roman Catholic; but other forms of religion are tolerated.

History.—The east coast of V. was discovered by Columbus in 1498; Ojeda and Vespucci followed in 1499, and, entering Lake Maracaybo, they found an Indian village constructed on piles, to prevent the evil effects of inundation, which they named Venezuela, or little Venice, a name which was afterwards applied to the whole country. The first settlement was made at Cumana in 1520, by the Spaniards; and V. remained subject to Spain till it claimed independence in 1811. In 1812, it returned to allegiance to Spain, but again revolted in 1813, and, forming with New Granada and Ecuador the republic of Colombia, it was declared independent in 1819. In 1831 the states separated, and a condition of revolution and anarchy prevailed for the most part in V. until 1863, when a provisional constitution was formed establishing the republic and guaranteeing to the people important privileges.

VE'NIAL SIN (Lat. *veniale*, pardonable, from *venia*, pardon), a term used, chiefly in Roman Catholic theology, to denote the less heinous class of offences against the law of God. Roman Catholic divines infer from many passages of Scripture that there are various grades of guilt in the culpable actions of man, and that these varieties of guilt involve a corresponding variation in the liability to punishment which is thereby entailed. Lowest in this scale of imputability is the class of offences known as venial, and by this name distinguished from those which are called mortal. Much difference of opinion exists even among Catholics themselves as to the nature and origin of this distinction. Some ancient writers explained mortal sins as being offences against a *precept*, whereas venial sins are but violations of a *counsel*. This explanation, however, is now universally rejected; and it is held that sin, of its very essence, whether mortal or venial, supposes the violation of a *law* or precept. Another explanation of the difference declares mortal sin to be that which deprives the soul of sanctifying grace; whereas venial sin only weakens and diminishes, but does not utterly extinguish sanctifying grace in the soul. This is an explanation, however, rather of the effect than of the nature of venial sin; and the more received opinion is that of St Thomas Aquinas, who explains mortal sin to be that which of itself subverts *the end* of the law; whereas venial sin but diverts it in a greater or less degree from that to which God intended that it should be directed. Catholics, while insisting on this distinction, are careful to explain that venial sin, although absolutely pardonable, is not to be supposed to be easily pardonable. They hold that it is of its own nature a great 'deordination,' and that it may and does entail a heavy liability to punishment, although not to the eternal punishment of hell, which is reserved for mortal sin. Sins may be venial either objectively or subjectively; objectively, when the 'object' of the law, or what is technically called the 'matter' of the sin, is light or trivial; as in the case of a petty theft, a slight departure from truth, or a passing ebullition of impatience or anger; subjectively, when, even though the 'matter' or 'object' is grave, there is but imperfect advertence, or not full consent, on the part of the subject or agent; as in the case even of a grievous injury done without full knowledge or intention on the part of the agent, or without full and deliberate consent. The degree of culpability in each case is supposed to depend on the objective or subjective qualification of the act. Catholics hold that persons dying in a state of venial sin are not excluded for ever from heaven; but that, since nothing unholy, even though in a minor degree, can approach God, the soul departing from life so stained with venial sin, is compelled to undergo a purification in Purgatory (q. v.), which they conceive to be of greater or lesser severity and duration according to the degree of culpability. Some of these writers teach that even venial sins involve punishment of extreme severity; and all expressly declare that it is never lawful, under any circumstances, to commit the smallest venial sin, even for the purpose of compassing a good and holy object.

Protestants reject the whole doctrine of *mortal* and *venial* sins. They regard all sins as, in one sense, *mortal*, i. e., as exposing the sinner to 'the wrath and curse of God, both in this world and that which is to come;' but all sins of the believer are expiated by the blood of Christ, so that there remains no penalty to be paid, either by penances in this world, or by sufferings after death. The very notion of venial sins appears to them to make light of the law of God; whilst that of the expiation of venial sins by the sufferings of the sinner himself, is inconsistent with their doctrine of justification, and with their views of the efficacy of the sacrifice of Christ.

VE'NICE, a fortified city of Northern Italy, one of the noblest, most famous, and singular cities in the world, is built upon a crowded cluster of islets, in the lagoon of the same name, on the north-west fringe of the Adriatic Sea, 23 miles east of Padua by the Milan and Venice Railway; lat. 45° 25′ N., long. 12° 20′ E. The lagoon of V. is banked off from the Adriatic by a long, narrow sandbank, extending south-west from the mouth of the Piave to that of the Adige, and divided into a number of islands by narrow sea-passages, six in number. Formerly, the chief of these entrances into the lagoon was the *Porto di Lido*, through which all the great merchantmen of the republic passed direct into the city, and which is still frequented by small vessels, and by the Trieste steamers. The Porto di Malamocco, between the island of the same name on the south, and that of Lido on the north, is now the deepest channel into the lagoon. Inside of this sandbank, and between it and the mainland, which is from three to five miles distant, is the lagoon—a sheet of shallow water, navigable for vessels of very light draught, except where channels have been formed naturally by rivers, and artificially maintained. In some parts of this marshy, sea-covered plain, islets have—by the action of currents and otherwise—become consolidated into ground firm

enough to be built upon, and fruitful enough to be cultivated; and in the midst of a crowded cluster of such islets, amounting in number to between 70 and 80, the city of V. is built. In the vicinity of V., the ebbing tide (the difference between high and low water is only between 2 and 3 feet) lays bare nearly everywhere a great plain of calcareous mud, laced, however, by an intricate network of narrow channels, from which the sea never retires; while at high water the whole surface is covered by the sea to the depth of from 1 to 1½ feet. The chief of the islands upon which V. is built is called *Isola de Rialto* (i. e., *rivo alto*), or Island of the Deep Stream. The islands, in many places only shoals, afford no good foundations for buildings; and the city, for the most part, is built upon artificial foundations of piles or stone. The fact that this city of marble palaces seems to rise vision-like from the unsubstantial sea, is sufficient to render its aspect at all times more or less fascinating; but in summer and autumn, the seasons of the highest tides, when the Grand Place of St Mark's is partially flooded, and when the image of each palace is doubled by reflection in that 'green pavement, which every breeze breaks into new fantasies of rich tesselation,' the city is indeed marvellously beautiful. The Canalazzo, or Grand Canal—its tortuous course through the city being in the form of the letter S reversed, thus, ꙅ—divides V. into two unequal parts, and is the main thoroughfare for traffic or pleasure. But the city is subdivided by 146 smaller canals, or *rii*, as they are termed. These are the water-streets of V., by means of which passengers can be conveyed to any quarter, for here the canal is the street, and the Gondola (q. v.) is the cab or carriage. Access can also be had to all parts of the town by land—across the canals by bridges, and along their banks by narrow passages called *calli*. There are in all 306 public bridges, and of these, three cross the Grand Canal—the Rialto, a stone structure, and the most famous; and two iron bridges. The Piazza or Square of St Mark's is the great centre of business and amusement, and the locality most frequently visited by travellers in Venice. It is 576 feet in length, 269 feet in greatest width, and 185 feet in least width. The east side of this square is occupied by St Mark's Church. The first church of St Mark's was built in 813, but was destroyed by fire in 976. It was rebuilt in 1071, and consecrated before the close of the 11th century. The edifice is Byzantine, with Gothic additions of the 14th c., and Renaissance alterations of the 17th century. It became the cathedral and seat of the Patriarch in 1807. The plan of St Mark's is the Greek cross. Above the doorway are the four famous horses which Marino Zeno brought from Constantinople in 1205, which were carried away by Napoleon in 1797 to Paris, and restored to V. in 1815. A great dome rises over the intersection of the lines of the cross; and over the transepts, other domes arise. The carved work, which is very profuse, is of the most exquisite description; and the building is perfect as an example of the delicately coloured architecture of the East. The structure is of brick, incrusted with richly coloured marbles. To the right of this beautiful edifice is the *Torre dell Orologio* (built in 1494), with a splendid dial in gold and azure, and very complex and ingenious movements. The north side of the square is almost entirely taken up by the *Procuratie Vecchie*, built in 1517, for the accommodation of the Procurators or trustees of San Marco, who had the care of the edifice, the management of its property, &c. Facing the Procuratie Vecchie, and on the south side of the square, are the buildings of the *Procuratie Nuove*, which are connected with a façade, which forms the west side of the square; and the two buildings constitute the *Palazzo Imperiale*. Leading south from the Piazza is the Piazzetta, or Little Square; and near the point where it makes an angle with the great square, is the Campanile, or Bell Tower, of St Mark, placed at some distance in front of the building to which it belongs. It was begun in 902, and completed in 1510, is 323 feet high, 42 feet wide at the base, and is surmounted by an angel, which serves as a weathercock, and is said to be 30 feet high. On the west side of the Piazzetta are the old Library and the Mint, the former now forming a part of the Palazzo Imperiale. At the south of the Piazzetta are the two famous red granite columns of V., one of which is surmounted by a figure of St Theodore, the patron saint of the republic till St Mark supplanted him; the other covered by the lion of St Mark. On the east side of the Piazzetta stands the Palazzo Ducale or Doge's Palace. The first palace reared on the site of the present one was built in 813, and though frequently enlarged, rebuilt, and re-decorated, it retained throughout the character of a Byzantine structure. In the year 1301, its architectural character began to change; and from that time till 1423, all the rebuilding and enlarging were executed in Gothic. After the date 1423, there are no buildings in Venetian architecture, properly so called; and the alterations made in the Ducal Palace after that time, as well as the palaces subsequently built, which took their style of architecture from the Doge's Palace, were in Renaissance, and like almost all the architecture now to be seen in V., 'of immeasurably inferior spirit in the workmanship' to that native style which flourished with the republic, and decayed with it. Starting from the landing-place of St Mark's at the east extremity of the Grand Canal, and proceeding west, a great number of palaces are passed. In former times, these palaces, or the magnificent buildings which occupied the same sites, were the warehouses and places of business of the great merchant-princes, most of whom possessed mansions in the suburbs, i. e., on some neighbouring island, which afforded more privacy than could be found in the city itself. A few of these are worthy of mention. Among them are the *Palazzo Giustiniani*, now the *Albergo dell' Europa*, perhaps the best hotel in V.; the *Palazzo Contarini Fasan*, a beautiful specimen of the richest Venetian Gothic of the 14th c.; on the left bank, the *Palazzo Pisani a S. Polo*, in arabesque Gothic of the beginning of the 15th c.; further on, on the right, the *Palazzo Loredan*, the *Ca' d'Oro*, a building of the 15th c., in the oriental style, restored by Mademoiselle Taglioni, the celebrated dancer. The bridge of the Rialto crossing the Grand Canal consists of one arch, the span of which is 91 feet, and the height from the water 24½ feet. The width is 72 feet, and the bridge is divided into three streets—the middle one 21 feet wide—and two rows of shops. The Bridge of Sighs (*Ponte dei Sospiri*) stretches across the canal called the Rio Palazzo, and communicates between prisons on the east, and the Doge's palace on the west bank of the canal. It is a covered gallery; and prisoners, when led to execution, passed from their cells across this gallery to the palace, to hear sentence of death passed upon them, and then were conducted to the scene of death between the red columns. The churches of V. are, as a rule, fine edifices, and of various styles. The styles are chiefly, first, Venetian Gothic, massive and solemn; second, Lombard; third, classical, i. e., Italian; fourth, decorated Italian. Among the chief churches after St Mark's are those of the *Frari*, with a colossal monument of Titian, a number of excellent pictures, &c.; and the church of *S. Giacomo di Rialto*, at the foot of the

bridge of the same name, occupies the site of the first church erected in V. in 421. But of the multitude of churches, a great many, though of pleasing proportions, are in the later and degraded styles of architecture. The Fine Art *Academia* is located in the ancient convent of *La Carità*, was formed in 1807 by Napoleon, and consists of several schools, and has the finest collection of pictures of the Venetian school, including works by Titian, Tintoretto, Bonifacio, Giovanni Bellini, Paolo Veronese, and many other masters. Specimens of the works of these artists are also to be found in many of the palaces

Grand Canal, Venice.

and churches of the city. There are several theatres, the chief of which is *la Fenice*. Fresh water, formerly, and even still to some extent, obtained at great expense, and of bad quality, from the mainland, or kept in cisterns, is now obtained by means of a number of Artesian wells, sunk in 1847, at the expense of the municipality. The library of St Mark's contains 120,000 vols., and 10,000 MSS. Many writers have led to misconception by omitting to note the fact, that the V. of to-day is by no means the same city as the V. of earlier and more famous days. On this subject, it will be of interest to quote the following from Ruskin's *Stones of Venice* (vol. ii. pp. 4, 5): 'The Venice of modern fiction and drama is a thing of yesterday, a mere efflorescence of decay, a stage-dream, which the first ray of daylight must dissipate into dust. No prisoner whose name is worth remembering, or whose sorrows deserved sympathy, ever crossed that "Bridge of Sighs," which is the centre of the Byronic ideal of Venice; no great merchant of Venice ever saw that Rialto, under which the traveller now passes with breathless interest.' Among the chief manufactories of V. are the glass-works, in which magnificent mirrors, artificial pearls, gems, coloured beads, &c. are made, and which employ 4500 people. Jewellery, especially chains of the precious metals, gold and silver stuffs, silks, laces, velvets, soap, earthenware, wax-candles, &c. are also manufactured; and sugar-refining and ship-building are carried on. The trade of V. has been steadily declining for several years. In 1862, 7777 vessels (including coasters), of 671,379 tons, entered and cleared the port; in 1865, the numbers were 6179 vessels, of 585,873 tons. More than half the quantity of goods imported were brought by British vessels, and consisted chiefly of colonial produce, coals, coffee, cotton, woollen, and linen yarns, and manufactured goods. The decline in the trade of V. being due more to the uncertain and unsatisfactory political state of the Venetian provinces, it may fairly be said that now when V. has been incorporated with Italy, and has entered on a new political career, her trade will revive. Pop. (1881) 129,445.

History.—Previously to the Roman conquest, we know almost nothing of the history of Venetia; but at the time when that event took place, we know that this region was inhabited by two nations, the Veneti and the Carni. The Veneti, from whom the district derived its name, occupied the tract between the Plavis (Piave) on the north, and the Athesis (Adige) on the south. The origin and affinities of this people are unknown, and almost the first thing ascertained concerning them is, that in the very earliest times of which we have any record, we find them a commercial rather than a warlike community, carrying on a trade in amber, which they brought from the shores of the Baltic, and sold to the merchants of Phœnicia and Greece. Under the Roman Empire, the province became opulent and

flourishing; and besides its capital, Aquileia, which rose to be one of the most prosperous cities in Italy, it contained also the powerful and wealthy provincial cities, Patavium (Padua) and Verona, and numerous important towns. But before the close of the empire, the early prosperity of this province was swept away by the Huns under Attila, who, in 452, razed Aquileia to the ground, and devastated the cities of Concordia, Altinum, Patavium, Vicentia, Verona, and other cities of the province. Many of the inhabitants of these cities, driven from their ruined homes, sought shelter in the marshy lagoons, in a position too miserable to provoke the ambition of the conquerors, and defended from invasion from the mainland by the wide tract of muddy shallows which intervened between it and the actual shore, and secured against attack by sea by the shallowness of the water and the intricacy of the sea-passages. Of the cluster of islands upon which ancient V. stood, the principal were Grado Bibione, Caorlo, Heraclia, Equilo, Torcello, Murano, Rialto, Malamocco, Pelestrina, Brondolo, San Nicolo, Chioggia (Piccola and Grande), Amiano, Constanziaco, Olivolo, and Spinalunga. To Rialto and to Malamocco, the refugees from Padua resorted. The name of the province they had left was afterwards transferred to the cluster of the islands of the lagoon—the new settlement being commonly known, at least as early as the 8th c., as Venezia, or as we have it, Venice. Protected by the peculiar position of the islands in which they had found refuge, the early settlers devoted themselves to the pursuits for which their situation offered the greatest facilities—fishing, and the manufacture of salt. Houses began to cluster thickly on the Rialto; and when, in 568, Padua was sacked by the Lombards, many of its inhabitants emigrated to that infant colony which their ancestors had helped to found. The first form of government of the island-commonwealth was republican, administered by a consular triumvirate; but in 457, the consuls were superseded by tribunes, who, elected annually, and varying in number at different times from one to twelve, administered the government for 240 years. But during this period, although the young republic progressed in wealth and population, it did little to increase its political importance. Society was divided into factions by the ambition of the rival tribunes, and variety of interests rendered united action in warfare impossible. With the purpose of remedying the many evils of the government, Cristofero, Patriarch of Grado, in 697, laid before the Arengo—the periodical convention of the whole adult male population—a scheme in which he proposed that the tribunes should abdicate sovereign power, and that a magistrate, with the title of Duke or Doge, in whom should be vested undivided authority in civic, ecclesiastical, and military matters, should be placed over them. The proposition was received with much favour, and the election to the office fell upon Paolo Luca Anafesto, who was invested by the Metropolitan with his insignia of office, a crown of gold and a sceptre of ivory, March 697. Anafesto remained at the head of affairs till his death in 717, and under his rule the position of the republic greatly improved. Civil discords were in great measure stilled, and the Venetian territory was increased by the acquisition of a strip of the mainland, obtained by treaty from the king of the Lombards. Under Orso, the third Doge (720—737), the Venetians entered upon that career of enterprise in which their prudence and their valour were always equally conspicuous, and which they continued to pursue to the last. In 735, the Lombards seized Ravenna, compelling the Exarch (q. v.) to seek shelter in the lagoon, and implore the republic to lend her aid in re-acquiring the lost territory. Still considering themselves as nominally subject to the eastern emperor, besides being anxious, in the interests of their commerce, of securing the alliance of Constantinople and of obtaining the freedom of the seas of the Eastern Empire, the Venetians supplied the required assistance, and re-instated the Exarch in his vice-royalty. The services of the Doge on this occasion were rewarded by the Byzantine court with the honorary title of Hypatos, or Imperial Consul. The common punishment among the Venetians for tyranny was putting out the eyes, and the reigns of several of the doges at this time are but periods of tyranny and excess on the part of the ruler, terminated by exoculation or assassination by the people. By a treaty concluded in 803 between Charlemagne and the Emperor of the East, it was stipulated that the maritime towns of Istria and Dalmatia should be considered an integral portion of the Eastern Empire. This stipulation was adhered to till the year 808, when the aggressive policy of Charlemagne, and of his son Pepin, now king of Italy, prompted Nicephorus, the Emperor of the East, to despatch a squadron to the Adriatic, and to seek the alliance of the Venetians; and as the latter perceived that they had much more to gain from the friendship of the court of Constantinople—the key to the rich waters of the East—than from that of Charlemagne, the alliance was soon cemented. War immediately broke out; and V. was invaded by King Pepin, who took a number of the islands without meeting any resistance—the inhabitants having all been transferred to the central island, Rialto. The French advanced to the island of Albiola, when, to their dismay, they found that the tide had been ebbing, and that their vessels were stranded in these shallows. The whole French squadron now fell an easy prey to the swift-moving galleys of the Venetians; and such of the enemy as escaped being drowned, were massacred by the relentless islanders (809). This struggle, called the battle of Albiola, was conducted on the part of the republic by Angelo Badoer, tribune of the island of Rialto, who was raised to the rank of Doge, and transferred the seat of government to Rialto—the island of Heraclia and others having previously enjoyed that honour. In his reign also, connection was established between Rialto and all the circumjacent islands, by means of wooden bridges, and the cluster thus united now formally took the name Venezia (Venice), although it commonly received that name early in the previous century. The year 829 is memorable as that in which, according to tradition, the body of St Mark was transferred to V. from Alexandria. 'That the Venetians possessed themselves of his body in the 9th c., there appears,' says Ruskin, 'no sufficient reason to doubt;' and however we may regard this story, it cannot be denied that the belief in it by the Venetians and others attracted crowds of pious pilgrims to Rialto, and thus increased the traffic and prestige of the port; while the Venetians adopted St Mark as their patron saint; and their war-cry, 'Viva San Marco!' inspired their courage in many a fight, both on sea and land. For many years after this date, the history of V. is marked by no event of special note; but the naval importance, the commerce, and wealth, and refinement of the republic, increased year by year. Doge Orseolo II. (991—1008) greatly extended the trade of the republic by establishing commercial relations between it and the empires both of the East and West, the Crimea, Syria, Egypt, Tartary, Tunis, &c.; and under his rule, the territory of V., which, until lately, comprised only the islands of the lagoon, and a narrow

slip of territory on the mainland, was increased by further acquisitions on the mainland, and by the addition of the sea-boards of Dalmatia and Istria, which he annexed in 998. In 1085 the provinces of Dalmatia and Croatia were formally ceded to V. by the Emperor of the East; and at the same time the emperor exempted the Venetian traders in all parts of the empire, excepting in Cyprus, Candia, and Megalopolis, from all duties and imposts whatever. In 1099, V. sent forth a fleet of 207 vessels of all sail to the succour of Godfrey de Bouillon and his companions of the First Crusade. The defeat of a hostile Pisan fleet employed by the eastern Emperor, Alexius Comnenus, and the capture of 20 of the vessels, and the obtaining of the body of St Nicholas at the island of Myra, were the chief incidents of this expedition, which partook more of the nature of a predatory cruise than of a pilgrimage and crusade. But it is noticeable that in all the cases in which V. joined the Crusaders, the chief motive seems rather to have been to monopolise the maritime department of all these movements, and to extend her commercial relations, than to secure the Holy Sepulchre in Christian possession. The great fires of 1106, which, besides destroying the island city of Malamocco, reduced 30 churches and vast numbers of private dwellings in V. to ashes, were indirectly the cause of great improvements in the architecture of the city; for previously to this event, the dwellings of the Venetians were almost all built of wood; but after it, the material used was always either stone or marble obtained from Italy, Istria, or Dalmatia, in all of which it is found in abundance. In 1111, the Doge Faliero sent forth 100 galleys to aid Baldwin I., the successor of Godfrey de Bouillon, in the conquest of such Syrian ports as remained in the hands of the Mussulmans; and for the assistance thus rendered, the Venetians obtained the right to hold in possession a church, street, mill, bakery, bath, &c., and to be represented by a local magistrate in each of the oriental possessions of Christendom—rights of the very greatest importance to a trading community. In 1123, a fleet sent to succour the Christians in Palestine, and led by the Doge Michieli, distinguished itself by gaining a magnificent victory over an Egyptian fleet, and by the capture of ten Turkish galleons richly freighted. In the same year, the Venetians and their allies, the Christians in Palestine, reduced the almost impregnable city of Tyre, after a siege of four and a half months. In 1122, a decree was passed by Johannes Comnenus, the Eastern emperor, commanding the Venetian residents at Constantinople and the other Greek ports to quit the imperial dominions, and declaring the suspension of all intercourse between the two powers. The islanders thus saw the most profitable branch of their commerce threatened with extinction; and, resolved to make reprisals, they launched a fleet in 1123, and in that and the following year, they inflicted a terrible punishment on the empire, capturing Rhodes, and investing and sacking Andros, Samos, &c., all the Ionian islands, a portion of the Peloponnesus, &c. Further, this brilliant expedition was not brought to a close until all the Dalmatian fiefs, stirred to insurrection by Stephen, king of Hungary, were again reduced to submission. The Venetians were prominent members of the League of Lombardy against the German emperor; and in 1177, won a splendid victory over the Ghibellines, headed by Otho, son of Frederick Barbarossa, in defence of Pope Alexander III., who had appealed for protection to the republic. Otho's squadron numbered 75 sail, chiefly drawn from the ports of Genoa and Ancona; the Venetian force consisted of 34 large galleys; and the victory they gained influenced the pope to shew his gratitude by presenting the Doge Ziani with a ring, with which he commanded him to wed the Adriatic, that posterity might know that the sea was subject to V. 'as a bride is to her husband;' and it is recorded that in this year the pompous ceremony of the 'marriage' was celebrated for the first time. The result of the naval battle of Saboro was that Frederick agreed to a congress, which took place at Venice in 1177. On the occasion of this congress, when the pope, the Doge, and other dignitaries were assembled in the palace of St Mark's, Frederick approaching the throne on which Alexander III. was sitting, and prostrating himself, allowed the pope to plant his foot upon his neck. The congress of V. restored peace between the empire and Lombardy and Sicily. The Doge Ziani died in 1178. He did much to improve the architecture of the city, especially of the Square of St Mark. Of the three lofty red granite pillars which he is believed to have brought from the island of Scio, two adorn the portico of St Mark's—the third fell overboard and was lost in the attempt to land it. In October 1202, the expedition known as the Fourth Crusade set out from V., in Venetian vessels, under the command of the venerable Doge, Arrigo Dandolo: it did not, however, reach Palestine, but directed its force against the Byzantine Empire, which fell into the hands of the so-called Crusaders, April 1204. See Dandolo. On the division of the conquests of this expedition, V. received the Morea, the Illyric Isles, a large portion of Thessaly, the Sporades, the Cyclades, the cities of Adrianople, Trajanople, Dedymotichos, and Durazzo, the province of Servia, and the coasts of the Hellespont. A fourth part of Constantinople was set apart as a quarter where the Venetians might reside, under the protection of their own laws; and all restrictions as to trade were abolished. V. was now in possession of the fairest portions of the Lower Empire, and she had long been undisputed mistress of the seas. As she increased in power, she also increased in magnificence; and her nobles, having no lands in which they might employ their wealth, lavished immense sums upon their palaces, their pictures, decorations, and costly garments. Her palaces were decorated with the treasures and spoils of the East, and a school of artists arose, who found noble subjects for their pencils in the deeds of Faliero, Polani, Ziani, and the Dandoli. Her noblemen were now the most opulent in Europe, and travel and refinement had made them also the most polished. The most notable events in the history of V. during the 13th c. are her wars with Genoa, in which her hitherto unfailing good fortune deserted her, and the star of Dandolo succumbed to that of Doria at the desperate battle of Corzuola, from which conflict the Venetians could only retire with 12 out of 96 of their galleys, the others being taken or burned; the truce effected between V. and Palæologus, the Emperor of the East, in 1268; the electoral reforms by which, after a complex and often repeated process of election and reduction by lot, the forty-one members were chosen who formed the Electoral College, and of whom it was necessary that the Doge-elect should obtain at least the votes of twenty-five. In 1289, the inquisition was formally established in V., but this institution was rendered subject to so many limitations by the government of the republic, that it remained comparatively harmless. In 1310, a conspiracy was formed for the correction of abuses that had crept into the constitution, and for the punishment of actual and fancied crimes. Among the conspirators were members of many of the noblest families of Venice. This conspiracy, known as the Quirini-Tiepolo conspiracy, proved abortive; but among

other reforms to which it gave rise was the formation of the famous Council of Ten, who caused themselves to be declared a permanent assembly in 1335. In 1343, Andrea Dandolo, born in the year of the Quirini-Tiepolo conspiracy, a most accomplished scholar and statesman, was raised to the Dogate. His *Venetian Annals*, remarkable for their precision and accuracy, place their author in the first rank of medieval historians. In 1348, the lagoon was visited by an earthquake, accompanied by unusually high and destructive tides. These misfortunes were followed in the same year by a most frightful visitation of plague; and in the course of the six or seven months during which the epidemic raged, two-fifths of the population of the city perished, and fifty patrician families became extinct. The middle of the 14th c. is remarkable for the famous conspiracy headed by the Doge Marino Faliero (see FALIERI), and for a war with Hungary, in which V. lost Dalmatia. The commercial rivalry of V. and Genoa in the East led to a war in 1352, in which the Venetians were defeated (February 13, 1352) by Paganino Doria in the straits of the Bosporus; and though they recovered their lost laurels in a battle (August 29, 1353) off the Sardinian coast, their fleet was totally destroyed by Doria, in the Gulf of Sapienza, November 3, 1354, and they were forced to make peace in the following May. In 1378, the Venetians interfered in the quarrel between the Genoese and Cypriots, and their fleet vanquished that of the Genoese before Antium (July), in revenge for which the Venetian fleet was almost annihilated off Pola (May 1379), and Pietro Doria, advancing upon V. itself, seized the island of Chioggia. But the courage of the Venetians was nothing weakened by their dreadful reverses, and they soon changed the aspect of affairs by becoming in turn the besiegers themselves, blockading the enemy in Chioggia, and, after reducing him to the brink of starvation, accepting an unconditional surrender, June 1380. In 1396, Genoa, the oldest and most harassing foe of the republic, ceased to have separate existence as an enemy, for in that year she placed herself under the dominion of the king of France, an arrangement which afforded immeasurable relief to V., because, for several reasons, there was now much less chance of a rupture between the two maritime powers. For a number of years after this event, V. experienced the highest prosperity: a prodigious impulse was given to her trade; her argosies traversed every arm of the ocean; intimate intercourse was kept up with every European country, as well as with Syria, Egypt, and even India; and important articles of Venetian merchandise were the iron of Staffordshire, the tin of Cornwall and Devon, and the wool of Sussex. But no less beneficent than the effects of peace were those of the war which soon broke out between Novello, Lord of Padua, and Venice. At the conclusion of this war (1407), V. found herself in the possession of an empire on the mainland of Italy, the smallest communal section of which equalled their ancient island domain, and of which the principal cities were Vicenza, Verona, Padua, Feltre, and Belluno. With the death of the Doge Mocenigo in 1423, a new era in the existence of V. commences, for now 'the central epoch of her life was past, the decay had already begun.' During the next thirty years, war was continually waged, chiefly against the Dukes of Milan, in the course of which V., taking into pay Carmagnola (q. v.) and his bands, achieved many a splendid victory, and suffered many a disastrous defeat; and though, on the return of peace (1455), the territory of the republic was materially increased, by the acquisition of Brescia, Bergamo, Treviso, &c. on the mainland, this territory was obtained only after a struggle, enormously expensive in life and treasure, and during the continuance of which the commerce of V.—the well-spring of its prosperity at all times—began to decline. Mocenigo's last advice to the senate was to avoid war, which was certain to bring destruction on the country, and to prosecute industriously their trade and commerce, and cultivate the arts of peace. The rejection of this advice, combined with the narrow-minded selfish policy always pursued by the Venetians in the contests among the Italian states, was the prominent cause of its decline. The same fatal warlike policy was pursued throughout the 15th c.; and the whole of the 16th c. was employed by them in repairing the disasters which the league of Cambrai had brought upon them. Her policy in the 17th c. was to aid the opponents of her most dangerous neighbour, Austria, by recognising Henry IV. of France, aiding Bethlem Gabor and Ragotski, the Duke of Savoy against Spain, and the Protestants against the Catholics of the Grisons. From 1646 to 1669, war was carried on between the Venetians and Turks, the latter being, in almost every encounter, severely defeated; though, from the disproportionate strength of the antagonists, they ultimately gained Candia, the object of the war. The discovery of the Cape of Good Hope by the Portuguese in 1486, opened up to that nation an ocean-route to India, which was taken advantage of by Vasco da Gama, who rounded the Cape on his voyage from Lisbon to Calicut in 1497. The carrying-trade of the world was now no longer, as it had been, in the hands of the Venetians; and the vast commercial activity which sprang up among the western nations of Europe upon the discovery of America, clearly shewed that the naval superiority of the republic had for ever disappeared. But even in spite of these changes of fortune, V. might still have maintained a respectable mediocrity among maritime states, but for the character of her government, which was conducted by an exclusive oligarchy, in whose hands alone all power and freedom were vested. Long prior to the invasion of the republic by Napoleon in 1796, V. had become worn out and corrupted; the government of the Council of Ten had become a reign of terror; its nobles shewed vigour only in the pursuit of pleasure; its peasants, inured to peace, were unequal to war—all the ancient virtue, valour, and hardihood, which had raised a colony of fishermen, 'perched like sea-fowl' on a muddy shoal, to be a nation of the first rank, had died out of the state. Napoleon forced V. to break the neutrality which it meant to maintain in 1796, destroyed its government, and ceded the province to Austria by the treaty of Campo-Formio (q. v.). In 1806, the city of V., with the territory of Venetia, was annexed to the kingdom of Italy by the treaty of Presburg (q. v.); but it was transferred to Austria in 1814. In 1866, the city and territory were ceded to and incorporated with the Kingdom of Italy.

VENETIA, TERRITORY OF, ceded to Austria in 1815 (see VENICE, HISTORY OF), formed from that year, along with Lombardy (q. v.), what was called the Lombardo-Venetian Kingdom, one of the Austrian crownlands. In 1859, Lombardy was ceded to Italy, but Venetia continued in the possession of the Austrians till 1866, when, as one of the results of the famous 'Month's War,' it also was ceded to Italy, and incorporated with that kingdom. While still in Austrian possession, Venetia was regarded as bounded on the N. by the Austrian crownlands of the Tyrol and Carinthia; on the E. by Görz and Gradisca; on the S. by the Adriatic Sea, the river Po, and the Duchy of Modena; and

on the W. by the river Adige and the Tyrol. Area, 9224 sq. m.; pop. (1870) 2,718,633. The territory of V., ceded to Italy by the treaty of peace, October 3, 1866, has the same frontiers which it had as an Austrian province.

VE'NI CREA'TOR SPI'RITUS, an ancient and very celebrated hymn of the Roman Breviary, which occurs in the offices of the Feast of Pentecost, and which is used in many of the most solemn services of the Roman Catholic Church. Its author is not known with certainty. On the authority of an ancient life of Notker, it is ascribed to Charlemagne; and Daniel, in his *Thesaurus Hymnologicus*, adopts this opinion; but it seems to be certainly older than the age of Charlemagne; and its correct classical metre, as well as the purity of its language, bespeak an earlier and purer age. Mone makes it highly probable, by intrinsic evidence, that it is the composition of Pope Gregory I. The Veni Creator Spiritus must not be confounded with another hymn to the Holy Ghost, Veni Sancte Spiritus, which somewhat resembles it. The latter belongs not to the Breviary, but to the Missal, in which it forms a 'Sequence' in the Mass of Pentecost Sunday and Octave. The latter hymn is not in classical metre, but in rhyme; and its language is plainly of a lower age. The author of the Veni Sancte Spiritus is believed to be King Robert of France, to whom several other hymns of the same class are attributed.

VENLO', a small but strongly fortified town in the Netherlands, province of Limburg, is situated on the right bank of the Maas, 45 miles north-north-east of Maastricht, and has a safe little haven. The fortifications are very irregular, consisting of a main wall, canal, outworks, three powder-magazines, &c. The town is well built, and stands on elevated ground, surrounded by morasses. Principal buildings are the town-house, the great arsenal, the church of St Martin, &c. V. has good schools and several charitable institutions. The population is about 10,000. The Roman Catholics number about 7500; the remainder, except about 100 Jews, being Protestants.

The principal means of living is trade with Germany in coal, stone, lime, iron, bricks, grain, &c.; besides stone-hewing, tanning leather, dyeing, grinding corn, beer-brewing, making cigars, starch, vinegar, chocolate, Venlo pepper-cake, &c.

V. was walled by Duke Reynold of Gelder in 1343. It has many a time felt the horrors of a siege, and been taken and retaken, the last time by the Belgians in 1830, in whose hands it remained till the Conference of London, June 22, 1839, when it returned to the Dutch.

VENN, Rev. Henry, a pious 'evangelical' clergyman of the English Church, was born at Barnes in Surrey in 1725. Having studied and entered into holy orders—in this respect following the example of his paternal ancestors since the Reformation—he was shortly after appointed curate of Clapham. In 1759, he resigned his curacy, to become vicar of Huddersfield in Yorkshire, which he left in 1769, on being presented to the rectory of Yelling in Huntingdonshire. He died in the house of his son, John Venn, rector of Clapham, in June 1797. The memory of his pure life, good example, and earnest preaching was cherished for many years after his death in the places which had benefited by his ministration; and his name is associated with those of John Newton, Thomas Scott, Charles Simeon, and others, as having had considerable influence on the evangelical movement in the Church of England. V. was the author of a book entitled *The Complete Duty of Man*, a sort of development or extension of the *Whole Duty of Man*. His *Life and Correspondence* was published by his grandson, Henry Venn, in 1839.

VE'NOMOUS BITES AND STINGS. Under this title are considered all wounds inflicted by animals which by their bites or stings introduce poisonous or irritating matter into the bodies of their victims. In this country, the subject is of comparatively little importance, since it is very seldom that the bite of our most venomous animal —the adder—is fatal; but in warmer countries, it demands the serious attention of the surgeon. Following Mr Busk, in his article on 'Venomous Insects and Reptiles,' in Holmes's *System of Surgery*, we shall briefly enumerate the most venomous animals found (1) amongst the invertebrata, and (2) amongst the vertebrata.

(1.) Amongst the invertebrata, the most formidable poisonous animals are to be found in the classes *Arachnida*, *Myriapoda*, and *Insecta*. The *Scorpions* are characterised by a prolonged jointed abdomen, terminating in a hooked claw, which is perforated, and connected at the base with poison-glands. The larger species, which are restricted to hot countries, by their sting give rise to symptoms of great severity, and occasionally cause death. 'The symptoms resemble those produced by the stings of wasps and bees in an aggravated degree, such as acute pain, a general nervous shock, attended with numbness, vertigo, occasionally temporary loss of sight, vomiting, &c.; while the local symptoms are swelling, and other signs of acute inflammation, followed, in many cases, by suppuration, sloughing, and their consequences. The remedy which appears to have obtained the greatest repute, is the application of ammonia externally, and its internal administration as a stimulant also; although it is probable that any other diffusible stimulus, combined with opiates, would be equally, if not more efficacious.'—Busk, *op. cit.*, p. 921. Several species of *Scolopendra*, or *Centipedes*, are regarded as highly venomous, and there is no doubt that the bites of some of the larger kinds inhabiting hot countries (especially of *S. morsitans*), give rise to excessively painful consequences, although less severe than those occasioned by the sting of the scorpion. In these animals, the poison is introduced not by a caudal sting, but by perforated curved fangs, connected with the mandibles, where poison-glands doubtless exist, though their existence has not been clearly established on anatomical evidence. Although *Spiders* have long had a bad reputation for their venomous bites, it is very uncertain whether (with one or two more or less problematical exceptions) their bite inflicts more than a simple wound. The most infamous of the spiders is the Tarantula or Tarentula (*Lycosa tarentula*), a citigrade or running spider, common in South Italy. See TARANTISM. Direct experiments, however, shew that the bite of this spider merely causes a slight local irritation. There is a spider inhabiting the island of Elba (*Aranea 13-guttata*) which is said to inflict a dangerous and fatal bite upon man and domestic animals; while the cork-forests of Morocco are said to be infested by an equally formidable spider, which is there known as the *Tendevaman*. It would be well if scientific travellers in those countries would obtain more definite information regarding these spiders. Amongst insects, many inflict more or less troublesome bites, while a comparatively few (and those almost, if not altogether restricted to the order *Hymenoptera*) inflict serious injury by their stings.

In the case of the majority of biting insects, it is very doubtful whether the local discomfort is due to the introduction of poison, or is the consequence of the prolonged mechanical irritation only.

In some cases, as in the ants, we know that formic acid (an irritant of great power) is introduced; and considering the prolonged irritation that follows the bites of many small insects, it is probable that there is some special acrid matter in their salivary secretion. This view is further borne out by the fact, that persons who suffer much from the bites of fleas and bugs (and the degree of annoyance varies extremely in different persons), are relieved by the local application of hartshorn, or some other preparation of ammonia. The 'Tsetse' (*Glossinia morsitans*), whose ravages are so graphically described by Dr Livingstone, does not attack man, but it affords an example of an insect, very little larger than a house-fly, being able to secrete an intense septic poison, which, introduced by its bites, causes certain death to cattle, the sheep, horse, and dog, while it is innocuous not only to man but to the goat, antelope, ass, and pig, to all wild animals, and to the calf until it is weaned. Another insect, mentioned but not described by the same traveller, produces by its bite vomiting and purging in man. In the case of stinging insects, the stinging instrument consists essentially of two fine and sharp darts, enclosed in a tubular sheath, at the base of which is a poison-sac, whose contents are injected into the wound made by the darts, which are usually serrated or barbed. The consequences of the sting of a bee or wasp are too familiar to require any detailed notice; and the sting of the hornet, a much rarer insect, is of the same nature, but of an aggravated form. The sting of a bee or wasp scarcely ever proves fatal, except the insect is swallowed in a cavity in ripe fruit, or in the act of drinking, and inflicts its sting on the throat. A sting in the fauces usually excites severe and diffuse inflammation, which may extend to the glottis, and thus cause suffocation. The treatment must be prompt, and consist of scarification internally, leeches externally, and possibly tracheotomy. When a large number of any of these insects make a combined attack, the result may be fatal. For the bites and stings of all these animals, the remedy recommended for scorpion-stings must be used; namely, ammonia in some form or other, and probably sal-volatile is the best. Amongst various domestic remedies for allaying the irritation excited by these stings, are vinegar, oil, spirits, Eau-de-Cologne, the blue-ball employed by washerwomen, consisting of indigo, &c. If possible, the sting should be extracted by bringing it to view by pressure over the wound with a watch-key, and then seizing it by small forceps.

Tsetse (*Glossinia morsitans*).

(2) Among the vertebrata, the only animals capable of inflicting poisoned wounds are the ophidian reptiles or snakes. As the description of the mechanism of the poison-fangs of venomous snakes is sufficiently given in the article SERPENTS, we may pass on to the subject of the nature of the *venom* and its effects. The venom is described, when fresh, as a transparent, yellowish or greenish, somewhat viscid, neutral fluid, much resembling saliva in its physical character, and exhibiting no obvious indication of its virulent nature. According to Prince Lucien Bonaparte, it contains, in addition to albuminous or mucous and fatty matters and the usual salts, a peculiar principle, to which he has given the name *echidnine* or *viperine*, which appears to be the active poisonous matter. The poison of the most deadly serpent produces no effect when introduced into the stomachs of living animals, excepting a slight irritation of the air-passages; nor is its effect more serious when applied to the surface of the skin, even when it has been slightly abraded. From the experiments of Fontana 'on the poison of the viper,' and other observers, it seems that the venom must be introduced directly into the subcutaneous cellular tissue. When, however, properly introduced, as through its natural channel, the poison-fang, 'its effects are very rapidly manifested; in fact, in some cases so rapidly as more to resemble those of prussic acid than anything else; usually, however, a brief interval elapses before the effects are shewn. These may be divided into general and local. The first symptoms in nearly all cases appear to be a general shock to the nervous system, attended with faintness, tremor, and great depression, sometimes with stupor, loss of sight, vomiting, lockjaw, and general insensibility; at the same time, great and sometimes intense local pain is set up. The limb, if the wound is in one of the extremities, rapidly swells. In severe cases, the swelling continues to spread till it reaches the trunk, or even the entire body, whose surface assumes a jaundiced hue. The gravity of the effects of the bite of a venomous snake appears to be in direct ratio to the comparative sizes of the snake and its victim, and also to the quantity of the poisonous secretion present at the time in the saccular gland. It is also greatly governed by the situation of the wound; one on an extremity, for example, being far less dangerous than one on the face or trunk. It has been remarked that two or more wounds at distant points are more rapidly effective than when they are inflicted on one spot.'—Busk, *op. cit.*, pp. 926, 927. The poison is one which seems to act primarily on the nervous system, and also to have a septic action on the tissues with which it is brought in contact; and in order to produce its effects, it must be directly introduced into the circulation.

The viper is the only poisonous snake in this country; but in other countries, there are many snakes whose bite is often fatal. America possesses the rattlesnake; the East Indies, the cobra da capello, the phorza-snake, &c.; and Africa and Australia are rich in poisonous reptiles. The bite of the viper presents in a mild form the typical symptoms which have been described, and, except perhaps to children, is very seldom fatal. In the case of many snake-bites, however, rapid death is the general result; and should recovery take place, it will often be very protracted and imperfect.

The symptoms produced by the bites of different kinds of venomous serpents differ considerably in character as well as in intensity, although there is a general resemblance.

The treatment may be divided into local and general. The local treatment consists in the *immediate* application of a ligature above the wound—provided the situation of the latter allow of it—to prevent absorption, and the excision of the bitten part, and then, after bathing it with warm water, sucking it, or, better, applying an exhausted cupping-glass over it. When the position of the bite prevents free excision, the poisoned tissues must be destroyed by *Liquor Ammoniæ*, or nitric acid. The general or constitutional measures consist essentially in the very free administration of the most powerful diffusible stimulants, such as hot strong brandy or whisky and water, and ammonia (an ammoniacal preparation, known as *Eau de Luce*, is a popular remedy for snake-bites). In these cases, in consequence of the prostration of the patient, he can bear an extraordinary quantity of stimulants. For the bite of the rattlesnake, the popular treatment is to make the patient drunk—a process

known as the *Western Cure.* Olive oil, freely administered, has been strongly advocated. We append in a foot-note* a few of the so-called specific remedies said to be adopted by the inhabitants of countries where the most virulent serpents abound.

VENO'SA (anc. *Venusia*), a town of Southern Italy, in the province of Basilicata, 100 miles east-north-east of Naples. Its castle, which gives a picturesque effect to the quarter in which it is placed, is now in ruins. The Norman abbey of the Holy Trinity, founded by the Norman, Robert Guiscard, and consecrated in 1059, though now in ruins, is imposing from its magnitude and regularity, as well as interesting from its antiquity. But the unfailing interest of V. arises from its being the birthplace of Horace (q. v.). In one of the streets is a column surmounted by the bust of the poet; and many of the localities of the vicinity can be identified with the places he has immortalised. Pop. about 7000.

VENT, or TOUCH-HOLE. See GUN.

VENTILATION. See WARMING AND VENTILATION.

VENTIMI'GLIA, a small fortified town of Northern Italy, in the province of Porto Maurizio, stands on a promontory on the sea-shore, 18 miles east of Nice. Besides an old cathedral, it contains the church of St Michel, containing two Roman milestones, and inscriptions by Augustus and Antoninus Pius. The strongly fortified castle above the town, recently repaired and strengthened, is the chief stronghold between Genoa and Nice. Wines and fruits are produced. V., the ancient *Albium Intermelium*, was the capital of the Intermelians, a Ligurian tribe; and its possession was contested in the middle ages by the Genoese, the counts of Provence, and the dukes of Savoy. Pop. 6256.

VE'NTNOR, the principal town on the south shore of the Isle of Wight, 10 miles south-south-east of Newport. It is situated amid the finest of the fine scenery of the Undercliff. Fossils are found in great quantity in the vicinity. With a fine southern exposure, and well sheltered from the north, V. possesses a mild climate, suitable for various classes of invalids, and has accordingly become a favourite winter and spring resort. The town is well provided with hotels and lodging-houses. Its beach is composed of beautiful yellow shingle. With these and other recommendations, V. has risen into importance within the last 30 years. Pop. (1861) 3208; (1871) 4841; (1881) 5493.

VENTRI'CULITES, a genus of fossil sponges, specimens of which are of frequent occurrence in cretaceous strata. They often form the nucleus around which flints are aggregated, and give their form to the flint-nodules. Indeed, it is believed by some that the flints are the metamorphosed remains of this genus, and other silicious sponges. Ventriculites are sessile, and cup-shaped, gradually opening from the base upwards. Twelve species have been observed.

VENTRI'LOQUISM, the art of producing tones and words without any motion of the mouth, and so that the hearer is induced to refer the sound to some other place. It does not depend on any peculiar structure of the organs of voice, but upon practice and dexterity. The name is founded upon the mistaken supposition that the voice proceeds from the belly. The art of the ventriloquist consists mainly in taking a deep inhalation of breath, and then allowing it to escape slowly; the sounds of the voice being modified and muffled by means of the muscles of the upper part of the throat and of the palate. The ventriloquist avails himself at the same time of means such as are employed by sleight-of-hand performers to mislead the attention. Ventriloquism is a very ancient art; and is mentioned by Isaiah (xxix. 4). The Greeks ascribed it to the operation of demons, and called ventriloquists *Engastrimanteis* (belly-seers), and also *Euryklytes*, from Eurykles, a professor of the art at Athens. In modern times, a Frenchman of the name of Alexandre obtained great reputation for his mimetic representations, combined with ventriloquism and sleight-of-hand; and in England, Love was long one of the most popular ventriloquists.

VE'NUE is the locality assigned in pleadings in English actions at law for the acts or circumstances out of which the action arises. The rule is, that the declaration or plaintiff's pleading must set forth some venue, which is usually the county where the cause of action arose; and this shews where the trial will take place, if at all. If the other party shews that it would be more convenient and less expensive to try the action elsewhere, then he may apply to the court, or a judge, to change the venue, and thus the trial may take place in a different county from that first stated.

VE'NUS, the Roman goddess of Love, subsequently identified with the Greek Aphrodite (q.v.). Originally, she does not seem to have occupied a conspicuous place in the Latin religion, and scarcely, if at all, figures in the history of Rome under the kings; a circumstance that throws no inconsiderable light on the Roman character, for it may be taken as an indication of the grave and serious disposition of the people, who highly valued matrimony and wedded joys, but cared little for the sentimental passion of love. Gradually, however, as the myth of the Trojan origin of Rome gained ground, the worship of V. emerged into importance. Aphrodite was the mother of Æneas, and Aphrodite became V.; Ares was Mars, and Mars was the national god of the Roman people; and as in the Greek mythology, Aphrodite was beloved of Ares, so, of course, V. was represented as the paramour of Mars, and thus was advanced by the poets to the dignity of the divine mother of the Roman people. Several temples were erected to her in Rome at different times and under different names, and rites were celebrated in her honour during the month of April—the spring-time of the year being thought favourable to the growth of tender emotions.

Venus of Canova.

The figure of V. was a favourite subject of ancient sculptors. One of the most famous specimens extant is the VENUS DE MEDICI, preserved in the Uffizi Gallery at Florence, and generally admitted to be the finest relic of ancient art. It was dug up in several pieces, either at the villa of Hadrian, near Tivoli, or at the portico of Octavia, in Rome, in the 17th c.; and after remaining for some time in the Medici Palace in Rome (whence its name), was carried to Florence by Cosmo III., about 1680. It is a nude statue, 4 feet 11½ inches in height, without the plinth; and from the exquisite symmetry and grace of the figure, it has become a sort of standard of excellence for the female form. The

* Decoction of Virginian snake-root; *Radix corineæ;* guaco, or the *Sacra vitæ anchora;* the Tanjore Pill, whose chief ingredient is arsenic. See the article SNAKE STONES.

right arm, and the lower half of the left arm, and a few piecings here and there, are modern. The plinth (also modern) bears an inscription copied from the old one, stating that the statue is the work of Cleomenes, the Athenian, son of Apollodorus, who flourished 200—150 B. C.

VENUS. See VENERIDÆ.

VE'NUSBERG, the name of several mountains in Germany, especially in Swabia; it appears to be met with in Italy also. It occurs for the first time, so far as is known, in a poem called the *Children of Limburg* composed in the Netherlands about 1337 (published by Van den Bergh, Leyden, 1846); but since then it is met with frequently in the literature of the 15th and 16th centuries, and has been preserved to the present day in legends and popular songs. According to these accounts, the Lady Venus holds her court in the interior of such mountains, in brilliant style, with song and dance, banquets, and all kinds of revels. Persons of earthly mould now and then visit her abode (they are always represented as *descending*), and tarry longer or shorter time, some even to the Day of Judgment, leading a life of perpetual delight; e. g., Heinrich von Limburg, a hero of the above-mentioned romance, and the noble Tannhäuser (q. v.). Yet they usually run the risk of eternal perdition; and therefore the faithful Eckhart sits before the entrance of the mountain, and warns people against entering. Nor does the condition of the sojourners always present so enticing an aspect; on the contrary, there are at times heard issuing from the mountain the lamentations of the damned; and Geiler von Keisersberg makes the witches in their night-expeditions rendezvous in the Venusberg. On putting together the various traits of these traditions, it is apparent that they originated in the mythology of the highest German antiquity. The Lady Venus is, under a name borrowed from the classical mythology, the universal Divine Mother of the old German belief, in her peculiar conception of Subterranean Goddess—the same being that appears under several other German names, each bringing forward some particular side of her character; e. g., Hulda (q. v.), the Gracious, Benign; Hilda, War; Berchta (q. v.), the Shining; Hel, the Concealed (from which our Hell is derived). In this character of goddess of the under-world, she is surrounded by the elves and other subterranean spirits, unbaptised children, fallen heroes, and the wise women devoted to her services, who, in the way of thinking of later times, were degraded to witches. The queen of Elfland, or Faery, is evidently only another form of the Lady Venus modified by a more decided mixture of Celtic and classic elements.—See the Introduction to the Tale of Tamlane, and Thomas the Rhymer, in Scott's *Minstrelsy of the Scottish Border*.

VENUS'S FLY-TRAP. See DIONÆA.

VENUS'S LOOKING-GLASS (*Specularia speculum*), a very pretty little annual, of the natural order *Campanulaceæ*, which has long been a favourite in flower-gardens, and is a native of corn-fields in the south of Europe. It has brilliant blue, white, or violet-coloured flowers, which fold up in a pentagonal manner towards evening.

VE'RA CRUZ, or VILLA RICA DE LA VERA CRUZ (the Rich City of the Real Cross), an ancient city on the east coast of Mexico, about 185 miles east of the city of Mexico, with a pop. of about 8000, composed of a motley collection from many nations. The city is built in a semicircle facing the sea, and is regularly laid out; the streets, which are wider than is usual in tropical countries, running east and west from the harbour, with others crossing them at right angles. The town is well defended by a strong wall, and other substantial works, as also by the castle of St Juan de Ulloa, which stands upon an island of the same name, about half a mile from the shore. The principal buildings are the cathedral, and about 15 other churches, generally built in the Moorish style, only six of which are in use; several monasteries; the court-house and prison, which stand on one side of the great square in the centre of the city. The houses and public buildings are generally built of rubble masonry, formed of small stones, interspersed with red tiles, the whole being afterwards covered with good durable plaster, and coloured with a variety of tints; and as most of the houses are in the old Spanish style, with open arcades, balconies, galleries, &c., the city presents a very picturesque aspect. There are a few good hospitals. The drainage of the city flows down open channels in the centre of the streets, which are almost on a level with the sea. This, combined with the wretched water which the inhabitants are compelled to use, the marshy and utterly barren nature of the surrounding country, and the pestilential nature of the climate generally, easily accounts for the frightful ravages of yellow and other fevers. Yellow fever is most prevalent from May till November. Although it is the chief port for all Mexico, V. C. has no harbour, but only an open roadstead between the town and the castle. The anchorage is exceedingly bad, and when the north gales, or *Nortes* (terrible hurricanes, bearing along with them clouds of sand from the sand-hills behind the town), prevail, many vessels are wrecked on the adjoining shore. A railway has been constructed between this city and Mexico; tramways for covered cars have also been laid down through the principal street to the railway station, a distance of 2½ miles.

The chief exports are the precious metals, cochineal, sugar, flour, indigo, provisions, sarsaparilla, leather, vanilla, jalap, soap, logwood, and pimento; and the imports, cotton, woollen, linen, and silk goods, brandy, iron, steel, wax, quicksilver, paper, hardware and cutlery, earthenware, &c. The exports from Vera Cruz for 9 months ending Sept. 30 1868 were valued at $6,189,554, and were chiefly silver and gold coin. The exports to the United States in 1867—8 were valued at $488,306.

VERATRINE ($C_{32}H_{52}N_2O_8$), an alkaloid occurring in cevadilla (the dried fruit of *Asagræa officinalis*), in the bulbs of *Colchicum autumnale*, and in the roots and seeds of different species of *veratrum*. Cèvadilla is the source from which it is most readily obtained; and for the method of extracting it we must refer to the pharmacopœia. In a state of purity, it is a pale, gray, amorphous powder, without smell; but even in the most minute quantity, powerfully irritating to the nostrils, sometimes producing dangerous fits of sneezing. It is strongly and persistently bitter, and highly acrid; insoluble in water, sparingly soluble in spirit and ether, but readily in diluted acids. Heated with access of air, it melts into a yellow liquid, and at length burns away, leaving no residue. In France, it is much used as an internal remedy for pneumonia and acute rheumatism, and for the latter its efficacy is well established. It is given in the form of pills, containing $\frac{1}{24}$th of a grain, of which three may at first be given daily, and the number increased up to eight or ten, unless pain in the throat or stomach, vomiting, or diarrhœa supervene, when their use must be suspended till these symptoms disappear. In this country, it is chiefly employed externally in the form of 'ointment of veratria' for neuralgic affections, and for scrofulous

diseases of the joints. It is an extremely acrid and violent poison, and must be prescribed with great care.

VERA'TRUM. See HELLEBORE.

VERB (Lat. *verbum*, a word), the name given in Grammar to that part of speech (see PARTS OF SPEECH) which predicates or affirms. See SENTENCE. As the very end of speaking is to assert or affirm something with a view to being believed or disbelieved, the part of speech which performs this office is, as it were, the soul of the sentence, and is called 'the word,' or verb, par excellence. Verbs affirm either some action or some state; as, 'John *reads*;' 'The sun *shines*;' 'The book *lies* on the table.' When the nature of the action requires an object to complete the sense, the verb is called *Transitive*, because the action *passes over* (Lat. *transit*) to an object; as, 'The child strikes *the dog*.' Some verbs complete the conception of the action in themselves, and require no complement; as, 'The child *sleeps*,' 'The bird *flies*.' These are called *Intransitive*. A distinction is attempted to be made between intransitive verbs expressing action (as *flies*, *moves*), and verbs expressing merely a state (as *sleeps*, *lies*), the latter being called *neuter* verbs. But it is often impossible to draw the line where activity ends and neutrality begins. Even in such a verb as *sleeps*, it is implied that the sleeper shews certain outward manifestations that make an impression, or act, on the beholder; when we affirm that an object *stands*, *lies*, or even only *exists*, or *is*, we in fact affirm that it 'acts,' in this sense. All verbs, then, agree in affirming action.

Nor can any exact or permanent division be made of verbs into transitive and intransitive. We can say whether a given verb in a particular sentence is used transitively or intransitively; but not that it is absolutely, and in itself, transitive or intransitive. It would be difficult, perhaps, to find a verb that cannot be shewn to be both the one and the other. 'The child *sees* the candle,' is unquestionably an instance of a transitive verb; in, 'The new-born child *sees*, but the puppy is blind,' the same verb is unquestionably intransitive. A verb used transitively has reference to particular acts; when the action is to be *generalised*, all specification of an object is dropped, and the verb becomes intransitive. Ex., 'Men *build* houses' (trans.); 'Men *build*, and time pulls down' (intrans.).

Intransitive verbs generally express a kind of action that we think of, at least, as composed of a number of parts, all like each other; as, he *walks*, *runs*. Now, with regard to the particular parts, we generally find that the same verb takes an object after it; as, 'He walks *a step, a mile, a long way*;' 'John played *a stroke, a piece, a game*;' 'He did not sleep a *wink*' (sleep being a prolonged winking). That any intransitive verb can take its cognate noun as an object, is a received doctrine. Ex., 'He *ran* a *race*;' 'They *died* an easy *death*.'

There are two classes of transitive and intransitive verbs, related to each other, in the following way:

Intransitive.	Transitive.	
he sits.	he sets	(causes to sit).
" lies.	" lays	(" " lie).
" falls.	" fells	(" " fall).
" rises.	" raises	(" " rise).
" sucks.	" soaks	(" " suck).
" drinks.	" drenches	(" " drink).
" dives.	" dips	(" " dive).

Those in the second column are called *causative* verbs. In the ancient forms of our language, there were many more such causative verbs, formed from root-verbs by a change, generally of the vowel. In Hebrew, every verb is capable of assuming the causative form. Modern English does not stand much on forms, but employs almost any verb in a causative sense without change of any kind. Thus: 'The horse *walked*'—'the groom *walked* the horse;' 'The wood *floated*'—'raftsmen *floated* the wood down the stream.'

Passive Form, or Voice, of Verbs.—Instead of 'Cæsar *defeated* Pompey,' we may say, 'Pompey *was defeated* by Cæsar.' In the former, the verb is in the *active voice*; in the latter, in the *passive voice*. In using the passive voice, the thing or person acted upon is made the subject of the sentence, and has the chief attention directed thereto; with the active voice, the doer and his action are more prominent. Of course, it is only transitive verbs that can thus have a passive voice.

One class of intransitive verbs become transitive by the addition of one of the class of words called prepositions; as, *speak—speak to*; *fall—fall upon*. Some verbs already transitive take prepositions simply to modify the sense; as, *set—set up*, *break—break down*. In such cases, the verb and preposition are to be considered as forming one compound verb, and might be written with a hyphen—speak-to, break-down. With the addition of a preposition, what was an intransitive verb becomes capable of being used in the passive voice. Thus, 'The king spoke to the duke about it'—'the duke was spoken to about it by the king.' 'Robbers fell upon him'—'he was fallen upon by robbers.'

Not, however, in all cases. For, 'The Thames runs into the sea,' we could not say, 'The sea is run into by the Thames.' And yet, with this same verb, we can say, 'The mail-train was run into by the express.' The distinction seems to be, that when we think of the object as sensibly affected by the action, and wish to call the chief attention to the effect so produced, the object may become the subject, and the verb be passive.

VERBENA'CEÆ, a natural order of exogenous plants, consisting chiefly of trees and shrubs, but partly also of herbaceous plants. The leaves are generally opposite and simple, and have no stipules. The flowers are generally in corymbs or spikes; the calyx is tubular, persistent, inferior; the corolla hypogynous, tubular, its limb usually irregular; the stamens generally four, two long and two short, sometimes equal, sometimes only two; the ovary 2—4-celled, the style solitary, terminal; the fruit composed of 2—4 achœnia united, sometimes fleshy; the seeds 1—4. The order contains almost 800 known species, chiefly tropical, some of them natives of temperate countries. The V. are allied to *Labiatæ* both in botanical characters and in properties, but the leaves have no oil-glands. Some are beautiful ornaments of flower-gardens and hot-houses; some are highly esteemed for their fragrance; some are used in medicine, as Vervain (q. v.), &c., although no medicinal plant of much value belongs to the order; the fruit of some species, as *Premna esculenta* and species of *Lantana*, is eaten; the leaves of *Stachytarpheta Jamaicensis* are used as a substitute for tea; and the timber of a number of species is valuable. To this order belongs the Teak (q. v.) of India.

VERCE'LLI, a venerable city of Northern Italy, in the province of Novara, stands in a fertile plain, on the right bank of the Sesia, 44 miles west-south west of Milan by railway. It covers a wide area, is surrounded by boulevards—those on the north-west side commanding a magnificent view of the Alps—is the seat of a bishop, and has the appearance of great prosperity. The cathedral, an edifice of about the middle of the 16th c., has a library containing a collection of ancient and valuable MSS. V. is a thriving city. Pop. about 25,000.

VERDE-ANTIQUE, a beautiful stone of a dark green colour, with patches of white, and sometimes also black and red. It is a kind of hard breccia, and was much prized by the ancient Romans, and is still in great favour in Italy.

VERDI, GIUSEPPE, the only living operatic composer of any note in Italy. He was born in 1814 at Rancola, in the duchy of Parma, where his father was an innkeeper, and he received his musical education at Milan. His first work was a musical drama called *Oberto di San Bonifazio*, which appeared in 1839; and he has since produced a number of operas, including *I Lombardi*, *Ernani*, *I due Foscari*, *Attila*, *Macbeth*, *I Masnadieri*, *Luisa Miller*, *Nabucodonosor*, *Rigoletto*, *Il Trovatore*, *La Traviata*, and *Un ballo in Maschera*—some of which have attained a very high degree of popularity, not only in Italy, but in France, Germany, and England. V.'s operas, while they abound in taking melody and in striking dramatic effects, are characterised by noisy orchestration. His earlier works are unsatisfactory to the scientific musician, from their lack of contrapuntal skill; but in his later operas there is an improvement in this respect.

VE'RDICT, in Law, is the finding of a jury as to the issue of fact raised between the parties. The usual verdict in criminal cases is guilty or not guilty; in civil cases, it is a verdict for the plaintiff or for the defendant, according to the fact. These are called general verdicts. In some civil cases, the jury, when doubtful, or when the court directing them is doubtful how the law ought to be applied to the facts, find a special verdict, i.e., specific facts, leaving the court to draw the proper conclusion. A verdict by a jury is usually conclusive in all criminal cases, and no new trial can be had; but in civil cases, the party defeated may, within a certain number of days allowed by the practice of the court, move to set the verdict aside, and apply for a new trial on various grounds; as, for example, that the judge misdirected or misled the jury; that the verdict was against the weight of evidence, or was perverse; that the damages were too great, or too small, &c. See NOT PROVEN.

VE'RDIGRIS is the popular name for normal Acetate of Copper ($2C_2H_3O_2C_u + H_2O$), a substance which is largely used for commercial purposes, and as an external application in surgery. It is prepared on a large scale by piling up copper-plates with alternate layers of marc or fermenting grape-skins. In the course of a few weeks, the surface of the copper is covered with a crust of the salt, which is detached, made into a thick paste with vinegar, and pressed into moulds. The salt thus obtained is in the form of a bluish-green tough mass, which is not easily pulverised. The formation of the salt by this process is due to the alcohol in the grape-skins being slowly oxidised into acetic acid, while the copper absorbs oxygen from the air, and the oxide thus formed unites with the acetic acid. Verdigris may be obtained more directly by placing the copper sheets in cloths dipped in vinegar. Verdigris is permanent in the air; when heated, it first loses water, and then acetic acid, the residue being metallic copper. Water resolves it into an insoluble tribasic acetate, and a soluble subsesquiacetate of copper—a point which must be recollected in employing this salt. It is used by the surgeon as a caustic application to venereal warts and fungous growths; it is also a good application in ophthalmia tarsi, and has been of much service in stimulating old and indolent ulcers, in the ulcerated sore throat of scarlatina, and in malignant ulcer of the tongue. It may be used in the form of an ointment or a liniment. The latter, formerly known as *Mel Ægyptiacum*, is composed of 1 ounce of powdered verdigris, 7 ounces of vinegar, and 14 of honey. The verdigris is dissolved in the vinegar, and to the strained solution the honey is added, and the whole is boiled to a proper consistence. It should be applied with a camel-hair pencil.

Verdigris is an active irritant poison, but is much more commonly the source of accidental than intentional poisoning, it being often formed in copper vessels used for cooking, or in the very reprehensible practice of putting copper coins into pickles to give them a fine green colour. If copper vessels for cooking are kept perfectly clean, they seem not to be dangerous, provided (1) no acid matter be placed in them; (2) that the boiled materials are at once poured out, and not allowed to stand to cool in them; and (3) that the vessels are always at once cleaned. But the interior of such vessels should always be tinned, care being frequently taken that the tinning remains entire. In cases of poisoning, the best treatment consists in the free administration of white of eggs and milk.

VE'RDITER, a pigment which is extensively used in common painting. It is either blue or green, the latter being generally known as Bremen Green. It is formed by a very complicated process from blue vitriol, or sulphate of copper, sea-salt, metallic copper, muriatic acid, caustic potash, and water, and occupies three months in its manufacture. The blue is most valued.

VE'RDOY, in Heraldry, a term indicating that a bordure is charged with flowers, leaves, or vegetable charges. Thus, a bordure argent verdoy of oak-leaves proper is equivalent to a bordure argent, charged with eight oak-leaves proper.

VERDUN, a fortified town of France, in the dep. of Meuse, stands on the right bank of the river of that name, about 150 miles (direct line) east-north-east of Paris. It was fortified by Vauban, and its defences consist of a wall with bastions and a citadel. It is the seat of a bishop; and, besides the cathedral—containing a very beautiful altar—there are numerous churches. On November 8, 1870, the fortress capitulated to the Prussians, with 108 guns and 5000 prisoners. Pop. (1872) 9869.

VERGE, a medieval term for a small shaft.

VE'RGER (Lat. *virga*, a wand), an officer of cathedral and collegiate churches, who carries the mace, whether before the dean or other chief dignitary, in procession, or on any other ceremonial occasion. The mace, however, has no sacred significance, but is simply an emblem of dignity.

VE'RJUICE, a vinegar formerly much used, made from sour cider, or from the juice of the wild crab. The expressed juice of unripe grapes is another kind of verjuice used in the vine districts. Both are occasionally employed in cooking.

VERME'JO, an important affluent of the Paraguay (q. v.).

VE'RMÉS (Lat. worms), the name given by Linnæus to one of the classes in his zoological system, in which he included all the lower invertebrate animals, whether of worm-like form or not. The study of their structure has since led to their arrangement in several distinct classes, and the Linnæan term is altogether disused.

VERMICE'LLI (Ital. little worms), a fine kind of Macaroni (q. v.).

VERMICULA'TION, checkering or chancelling formed in mason-work as an ornament, giving the appearance of being eaten by worms.

VE'RMIFUGES, VE'RMICIDES, or ANTHELMINTICS, are remedies which possess the property of destroying intestinal worms, or of expelling them from the digestive canal. The only worms whose presence in the intestinal canal is so common, that the remedies for their destruction and expulsion require special notice, are the two varieties of tapeworm known as *Tænia solium* and *Tænia mediocanellata*, or the *hooked* and the *hookless Tapeworm* (q. v.) the *Ascaris lumbricoides*, or *large round worm*, and the *Ascaris* or *Oxyuris vermicularis*, or *small threadworm*. A few of this class of medicines are said to be useful in destroying all these kinds of worms—viz., the tapeworms, the round worms, and the threadworms. In this category, we may place *Absinthium*, or *wormwood*, whose effects are doubtful; *Sabadilla*, or *Cevadilla*; *Santonica*, or *worm-seed*, and its active principle, *Santonin* (q. v.); and *Oil of Turpentine*. As in our notices of the different human entozoa, we have referred to this article for the appropriate treatment of each, we will commence, in consequence of its greater importance, with the remedies that have been recommended in tapeworm, ranging them according to the repute in which they stand. (1.) The root of the male shield-fern (*Aspidium filix mas*), of which the best preparation is the 'Liquid Extract of Fern-root' of the *Pharm. Br.* It may be taken in the morning before breakfast, in doses of about a scruple, in the form of an emulsion with yelk of egg, syrup of orange-peel, and water; and if the worm does not come away in six hours, a brisk purgative should be administered. Generally, however, it is expelled by a single dose, in the mass, and without pain or much uneasiness. (2.) *Cusso* or *Kousso*, the flowers of *Brayera anthelmintica*, in doses of from half-an-ounce to an ounce of the flowers (infused for a quarter of an hour in ten ounces of lukewarm water and a little lemon-juice), or of four ounces of the infusion of the *Pharm. Br.*, and following in four hours, if it has not acted, by a dose of castor oil, is a safe and very sure remedy. (3.) Decoction of the bark of the root of the Pomegranate tree (*Granati radix*). (4.) *Oil of Turpentine* (q. v.); and besides these, which are the best remedies, the seeds of the Common Pumpkin (*Cucurbita pepo*); *Kamela*, the powder adhering to the capsules of *Rottlera tinctoria*; Santonine, &c., have found their advocates. All these medicines should be taken fasting, or after a light supper on the previous evening.

Foremost amongst the remedies for *Ascaris lumbricoides*, Dr Cobbold places *Santonin* (q. v.); but kamela is also very efficacious in doses of from one to two drachms every four hours. Dr Waring, in his *Materia Medica*, gives a long list of remedies employed with success in the East, but unknown in this country. *Ascaris vermicularis*, or the *threadworm*, is more successfully attacked locally in the rectum by injection, than by medicines administered in the ordinary method. Amongst the best forms of enemata are half a drachm of tincture of sesquichloride of iron in a little gruel, retained in the bowel as long as possible, or injections of salt and water, or of infusion of quassia. As an internal remedy, santonine is the best. The most annoying symptom occasioned by these worms, the intense itching about the lower part of the bowel, especially in the evening and at night, is best relieved by the introduction of a little mercurial ointment within the verge of the anus, when the patient retires to rest.

VERMI'LION, or artificial Cinnabar (q. v.), is a bisulphide of mercury, formed by mixing 100 parts of the metal with 16 parts of sulphur, and subliming them in properly constructed retorts; the result is, heavy dull red cake, an inch or so in thickness, of acicular crystalline texture, and exactly resembling in these respects the native cinnabar. When, however, it is finely powdered, it acquires the beautiful bright red colour so well known in this pigment. The finest European vermilion was, until lately, made at Utrecht in Holland, and this manufactory supplied nearly all Europe. It is now, however, manufactured in other places, particularly in Istria. A new process, invented by Kirchoff, has also been introduced, and is employed in most manufactories for making the finest quality. It is called the humid process, from the employment of water, with which the ingredients are triturated at a temperature of not more than 130° F., until the mixture, which is first black, turns a brownish red, when the temperature is lowered to 114° F., and steadily maintained at that until the brightest colour is obtained; it is then allowed to subside, the liquid is decanted off, and the residue washed in clean water. The Chinese have always been famous for the extreme beauty of their vermilion.

VE'RMIN (Lat. *vermis*, a worm), a term commonly applied to small noxious animals, particularly to those which, unless their increase is checked, are apt to become excessively numerous. Of some of the applications of this term, as to parasitic insects, it is unnecessary to say anything; but it seems proper to notice the use made of it by farmers and gardeners, with reference to quadrupeds and birds injurious to their crops, and by gamekeepers with reference to those which are destructive to game. In the estimation of the gamekeeper, all those animals are vermin which are known ever to prey upon any kind of game, or to rob the nests of game-birds. He therefore wages unceasing war not only against foxes and polecats, but against weasels, stoats, hedgehogs, kites, hawks, carrion-crows, magpies, and owls. The results are not agreeable to the farmer, as the balance of nature being thus interfered with, animals destructive to his crops multiply without restraint, particularly rats, mice, and voles. The farmer is apt to regard some kinds of game themselves as vermin, especially hares and rabbits, which, when very numerous, cause him great loss. As to these, probably, there might be ready enough means found of reducing their numbers, if it were permitted, even although an undiminished assiduity should be maintained in killing all beasts and birds of prey. It is otherwise, however, as to the smaller quadrupeds already named, and the destruction of their natural enemies is followed by their excessive multiplication. Beasts and birds of prey have their use in the economy of nature. The larger kinds, which are dangerous to man himself, or destructive of the animals valued by him as his property, are no longer of use in thickly-peopled and extensively cultivated countries; their extirpation is therefore to be desired, and they rapidly disappear before advancing civilisation; but their use in a different state of things may be seen, if we reflect on the vast multitudes of antelopes and other herbivorous animals in the wilds of Africa, which would soon cease to find sustenance for themselves, but for these destroyers. Kites, kestrels, owls, weasels, and hedgehogs are particularly useful to the British farmer, as preying upon the mice and voles, which are often extremely destructive to his crops, eating whole rows of seed-wheat and beans, proceeding from one end of the row to the other; and all the injury done to him by game, or at least by feathered game, is generally little in comparison with that which results from the continual shooting and trapping of them by gamekeepers. No expedient is known so likely to rid the fields of mice and other such pests, as to put a stop to the destruction of the quadrupeds and birds which prey upon them.

The farmer himself, however, sometimes falls into the error of seeking to interfere unduly with the balance of nature—complaining of rooks as a mere nuisance, and demanding the destruction of rookeries. The money which he expends in guarding his fields from rooks at certain seasons, when they are apt to injure his crops, is more than repaid by their services at other times in the destruction of grubs. Wood-pigeons, which have of late become extremly numerous in some parts of Britain, do more harm to the farmer than rooks, as they feed chiefly on grains, seeds, young clover, and the like, and are very voracious; yet they seldom dig much, but take only what is on the surface of the ground. They, however, are now regarded in the light of true farm-pests. Small birds, such as feed both on insects and seeds, are, like rooks, not to be regarded as vermin. They consume, it is true, a certain portion of the grain, but they are of incalculable use in devouring those insects which are the worst of all destroyers of crops. The consequences which have ensued from the great reduction of the numbers of small birds in France, where they are eagerly sought for the table, should act as a warning to the farmers of all other countries. The most intelligent agriculturists of France are now extremely anxious for the increase of the numbers of small birds, as their only protection against caterpillars and grubs of many kinds. To give a premium for the destruction of sparrows, as is sometimes done in England, is bad policy, unless peculiar local circumstances have led to their extraordinary multiplication.

Moles are amongst the animals commonly regarded as vermin by farmers and gardeners; and in gardens they are certainly a pest; but it is probable that many pastures owe much of their long-continued fertility to the incessant stirring of the soil by moles; and when they are not excessively numerous, it may be better to undertake the labour of scattering the mole-hills, than to attempt the destruction of the creatures which throw them up.

Even rats and mice, although often amongst the most troublesome of vermin, are not, in all circumstances, to be regarded as mere pests. They are so, it is true, in fields, in houses, and in ships; but much of the refuse of towns would probably become far more offensive and injurious than it is, if it were left to putrefy, and the rats, which frequent the most filthy places, render valuable service by devouring it. Police regulations may be imagined, which, if strictly enforced, would render the presence of rats no longer desirable; but in this case, their numbers would probably soon diminish with the diminution of their supply of food.

Some of the means used for the destruction of vermin may be briefly noticed. Besides the use of cats for catching mice and rats, and of dogs, particularly terriers, to kill rats, the principal means employed are traps and poison. Of traps for rats and mice, there is great variety. The common wire spring-trap for mice, baited with cheese or scorched oatmeal, which catches them by the neck and chokes them, on their biting through a thread, in order to reach the bait, is probably the best, and is too well known to need description. The stamp spring-trap in general use for rats is equally well known, but is liable to the objection, that cats, or even dogs, may be caught in it, and have their legs broken, or be otherwise injured, when it is placed in situations to which they have access. Rats also learn to apprehend danger, and avoid the trap; their sense of smell probably guiding them, which is very acute, and apprises them of the touch of human hands. To overcome this difficulty, oil of aniseed, or oil of caraway, is often used, which seems to render the bait more attractive, at the same time that it hides the warning smell. Professional rat-catchers ascribe especial value to oil of rhodium, but it is more expensive than the oils

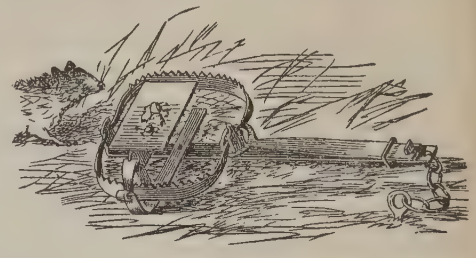

Fig. 1.—Common Stamp Spring-trap, baited and set.

already named. The poison most commonly used is the white oxide of arsenic, which, however, must be used with great caution, so that only the creatures for which it is intended may get at it. Pieces of bread and butter sprinkled with sugar are laid down for a day or two, and then bread and butter sprinkled with arsenic; some of the oils which have been mentioned being at the same time employed. A better mode of poisoning rats is by a preparation devised by Dr Ure, which is fatal to them, but scarcely dangerous to other animals. Hog's-lard is melted in a bottle plunged in water at a temperature of 150° F., and an ounce of phosphorus is added to every pound of lard, with a quantity of proof-spirit, to aid the mixture of the lard and phosphorus, which, when cooled, form a white mass, the spirit separating from it, so as to be fit for use again. This compound, very gently warmed, and mixed with flour and sugar, may be made into pellets, flavoured with some of the attractive oils, and laid down near rat-holes. It is also used with advantage for field-mice, small pellets being scattered where they are very abundant. It is safer for this purpose than nux vomica, which is sometimes used, and more effectual than the powder of hellebore and stavesacre seeds.

In farm-yards, the precaution of placing ricks on frames or supports which mice cannot climb, is of great importance, as mice, when they get into a rick of corn, soon multiply excessively, and effect great destruction. No sticks should be allowed to rest against ricks. Corn in stacks may be secured from mice by building them on stone staddles, with an overhanging ledge, or on iron staddles, the smoothness of the iron preventing mice and rats from climbing.

The method employed with great success for destroying the field-vole, or short-tailed field-mouse, by digging pits, is noticed in the article VOLE.

Rats may be destroyed in great numbers in a barn, if it can be made nearly air-tight, by placing in it a number of chafing-dishes, filled with lighted charcoal, strewing over them bits of broken stick-brimstone; after which the barn must be quitted as quickly as possible, the door closed, and so left for two days. When the door is opened again, numerous rats will be found lying dead. Another method is that of spreading the floor with caustic potash, which, adhering to the rats' feet, is licked off. The result is obvious.

Where rats and mice are not very numerous, the trap is sufficient, but where they swarm, poison must be employed.

Rubbing the hands with a mixture of essential oils, before setting the trap, is enough to prevent

the smell of the hands from being noticed by rats.

Subjoined are illustrations of two traps for taking vermin either alive or dead. They are the invention of Mr Miles, gardener at Roslyn House, Hampstead, and have been found, we believe, to answer well.

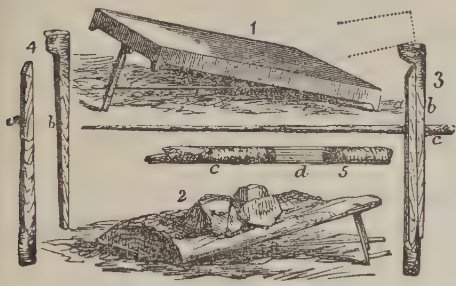

Fig. 2.—Miles' Patent Vermin Traps:

1, trap set for catching animals alive; 2, trap, on the same principle, for killing animals, it being simply a slab of wood loaded with stones; 3, 4, enlarged view of apparatus for setting; a, the strut-piece, which rests on the ground, is bevelled at the top, to catch in the notch of the other strut-piece, b; they are held loosely in position by a notch, d (5), in the piece c, to the end of which the bait, e, is attached. When the animal touches the bait, it detaches the piece c, causing the two strut-pieces to topple over and release the trap.

A very good box-trap used for rats, and also for martens, &c., is open at both ends, the doors closing when the animal runs upon a bridge in the middle. Another and very simple kind of box-trap is used for rats, open only at one end, the bait placed near the other, and connected with a string, which, being loosed whilst the bait is being eaten, the door falls. This trap, however, can secure only one rat at a time.

Mixture of oils recommended for rats: oil of rhodium, 1 scruple; oil of caraway, 1 drachm; oil of lavender, 5 drops; oil of aniseed, 10 drops; tincture of musk, 2 drops.

A stamp-trap, such as is used for rats, is used also for foxes, wild-cats, &c.—the difference being merely in size.

VE'RMONT (Fr. *verd mont*, green mountain), one of the U. S. of America, one of the five New England states, and the first state received after the adoption of the Federal constitution; lat. 42° 44′—45° N., and long. 71° 25′—73° 26′ W.; bounded on the N. by Canada; on the E. by the Connecticut River, which separates it from New Hampshire; on the S. by Massachusetts; and on the W. by New York, from which it is separated for 100 miles by Lake Champlain. It has an area of 10,212 sq. miles, and is divided into 14 counties. The principal towns are Burlington, Montpelier (the capital), Rutland, Bennington, Windsor, St Albans. The surface is rather hilly than mountainous, the Green Mountains being rounded eminences 2000 to 2500 feet, covered with vegetation, and cultivated to their summits. The rivers are the Connecticut and its western branches, and the Onion, Lamoille, and smaller streams, affording abundant water-power, and falling into Lake Champlain (q. v.). The state is studded with small lakes. The geological formations are the azoic and the lower groups of the Silurian. East of the Green Mountains is a bed of Devonian limestone, 20 or 30 miles wide. Drift covers the whole state. Along the western part of the state, a great belt of quartz is covered by a bed of crystalline limestone 2000 feet thick. Slates are found on Lake Champlain, with hæmatite iron, supplying several blast-furnaces. There are deposits of gold, pyritous copper ore, and at Rutland, rich quarries of statuary marble. Clay for white stoneware is found at Bennington, and there are several quarries of soapstone. The climate is cold, with long and severe winters, but healthful—the temperature ranging from —17° to +92°. The soil is a rich loam, and the country well wooded with hemlock, fir, spruce, oak, beech, sugar-maple, pine, hickory, elm, butternut, birch, cedar, &c. The hills are well adapted for pasturage. The chief products are wool, cattle, maple-sugar, butter, cheese, hay, and potatoes. In 1870 there were 34,540 farms, averaging 134 acres, cultivated by their owners; and the live-stock was valued at 23,888,835 dollars. The state has some fine scenery, and beautiful waterfalls—as Bellows Falls on the Connecticut, the Great Falls of the Lamoille, Falls of the Winooski, a fall of 70 feet on the Missisquoi, &c. There are 687 miles of railway, two lines crossing the mountains. The chief business is agriculture. In 1870 there were 8 cotton-mills, 65 woollen-mills, and manufactures of lumber, machinery, leather, bar and pig iron, scales, &c. V. has 699 churches, or 1 to every 472 inhabitants; 3 colleges—the University of V. at Burlington, Middlebury College, and Ripley Female College—with several theological and medical institutions; 41 academies, 3 normal schools, and 2827 district free schools, with 52,067 pupils in attendance; 43 weekly and 3 daily newspapers. The government is of the usual republican form. The governor has a salary of $1000; the state treasurer, $500; and the secretary of civil and military affairs, $275 a year. There are two houses of the legislature, elected by 'every male citizen of peaceable behaviour, 21 years old, and 1 year resident in the state.' The first settlement in V. was in 1724, when it was claimed as a part of the New Hampshire grants. In 1763, it was claimed by New York, under grants of Charles II. to the Duke of York. For ten years, the New York officers were resisted, and sometimes tied to trees and whipped by the lawless settlers. These contests were stopped by the Revolution; but V., a refuge for settlers from the other states, remained eight years out of the Union. It was chiefly the V. militia that gained the victory of Plattsburg, on Lake Champlain, in 1812; and the Green Mountain state contributed largely to the Union forces in the War of Rebellion. The pop., containing less than $10\frac{1}{2}$ per cent. of persons of foreign birth, mostly from Ireland and Canada, with a very slight increase, owing to the large emigration to the western states, was in 1860 315,116; in 1870, 330,551; and in 1880, 332,286.

VERNAL GRASS, Sweet (*Anthoxanthum odoratum*), a grass very common in Britain, in Europe in the United States, and the northern parts of the world generally, growing in meadows, woods, and pastures. It is about a foot high, with spiked oblong panicle, the flowers remarkable as having only two stamens. The spikelets are 1-flowered; the glumes very unequal; the floret accompanied with two rudimentary florets, which botanists have very generally described as two outer paleæ. This grass flowers earlier in summer than most of the European grasses. It is relished by cattle, and is sown along with other grasses to form permanent pastures. The pleasant smell of newly-mown hay is often chiefly owing to this grass, which is fragrant when drying, and contains Coumarin (q. v.). It yields, by distillation, an essential oil of an agreeable odour. The straw of this grass is of use for the finest kinds of straw-plaiting.

VERNA'TION, in Botany, a term employed to designate the manner in which the leaves are arranged in the leaf-bud. It corresponds with

ÆSTIVATION (q. v.) in the flower-bud. There are great differences in the vernation of plants, and these differences are characteristic not only of species but of genera, and even of natural orders, but the vernation of the same species is always the same. The vernation of plants is very interesting; in some, the leaves are very simply placed together; in others, they are most curiously folded, rolled, or plaited, and interlaced with each other, yet so as to separate most readily when the proper time for their expansion comes.

VERNET, ÉMILE-JEAN-HORACE, a celebrated French painter of battle-pieces, in whom may be said to have culminated the talent of a family through several generations distinguished in the sphere of art. His grandfather, CLAUDE JOSEPH, born in 1714, was a native of Avignon. By Antoine Vernet, his father, also a painter, Claude Joseph was early initiated in art, and going at the age of 18 to Italy, he remained there 20 years. Towards the end of that period, much of which had been passed in struggle and privation, his reputation as a landscape and marine painter had become so high, that he was invited to Paris by Louis XV., who assigned him apartments in the Louvre. Between this time (1752) and his death in 1789, he painted an immense number of pictures, one of his chief undertakings being a series of large pieces commissioned by government, representing the chief seaports of France. These were 15 in number, and are still to be seen in the Louvre, with many other of his best works. During his life, he was held to be, in France, without a rival in his own department; and an honourable rank continues to be assigned him among the painters of his country. He married at Rome an English lady, a Miss Parker, by whom he had a son, ANTOINE-CHARLES VERNET, born at Bordeaux in 1758, and popularly known as Carle Vernet. Carle received his education, in the first instance, from his father, and afterwards at the Academy of Paris, where, in 1782, he gained the chief prize, which brought with it the privilege of which he availed himself, of studying for some years in Rome. His subsequent success in Paris was great; he achieved the highest honours of his profession, became Chevalier of the order of St Michel, as also of the Legion d'Honneur, and died September 27, 1836. He was especially celebrated as a painter of horses; but his chief works were battle-pieces on a large scale, chiefly commemorative of the triumphs of the great Emperor, and as such, amazingly popular with the Parisian public. The principal are—'The Battle of Marengo,' 'The Morning of Austerlitz,' 'The Emperor giving orders to his Marshals,' 'The Bombardment of Madrid,' 'Battle of Rivoli,' 'Entrance of Napoleon into Milan,' and 'Battle of Wagram.'

The youth of HORACE VERNET, his son (born in Paris, June 30, 1789), was passed amid the tumults and anarchy of the Revolution; and his general education was as irregular and incomplete as in such an element we might suppose it; but he had in his father a capable instructor in art, the hereditary genius for which very early became noted in him. It was the wish of his father that as he had himself done, his son should go to study at Rome; but he failed in the competition for the travelling-pension for that purpose, given by the *Académie des Beaux Arts*, and the scheme was necessarily abandoned. Undepressed by his disappointment, the young V. married, and commenced his independent career as a painter, being then (1809) only 20 years of age. The *rôle* which he chose was that suggested at once by the previous success of his father, and the military intoxication of the Parisian public. Young as he still was, he had served for some time as a soldier, not, so far as is known, with any special distinction, yet, doubtless, with such practical experience of the detail of a soldier's life in the field, as would be found exceedingly available in his efforts for distinction of another kind. Whereas the treatment of military subjects by his father and others had been, hitherto, more or less of the conventional and so-called imaginative kind, more properly to be called imaginary, the new aspirant, with his fuller sympathy and knowledge, sought for his effects in that serious rendering of truth which is the basis of all authentic imagination. In the halt, the bivouac or the battle, the French soldier should be painted according to the veritable fact of the matter, as V. himself had seen, or could rigorously so conceive it. The success which rewarded this attempt at more earnest and truthful conception, was brilliant and instantaneous, his very first pictures of the kind—'The Dog of the Regiment and the Horse of the Trumpet,' 'Capture of the Redoubt,' 'Halt of French Soldiers,' &c.—being received with an enthusiasm of favour accorded to those of no other artist. In 1812, to confirm this popular approval, the first-class medal was awarded to him; and in 1814, he had the title conferred on him by the Emperor of Chevalier of the Legion d'Honneur. The unrivalled popularity which he had thus at a bound achieved, ever afterwards remained with him; and the favour which he enjoyed from the Emperor, whose victories he signalised on his canvas, was continued to him by the restored dynasty, whose sympathy with these favourite subjects, which, as occasion served, he continued as before to paint, could only be supposed imperfect. By Charles X. he was, in 1825, made Officer of the Legion d'Honneur; and in the next year, he was elected Member of the Institute. In 1827, he was appointed Director of the French Academy at Rome, whither he went to reside. He remained there for several years; and on the withdrawal of the French Legation, occasioned by the revolution of 1830, he was appointed to act as representative of his country at the Roman court.

With Louis Philippe, the services of V. were in especial request; and one of his most gigantic undertakings, the grand series of paintings in the Constantine Gallery at Versailles, commemorative of the triumphs of the French arms in Algeria, was a task prescribed him by that monarch. In pursuance of this object, he more than once visited Algeria; as, indeed, throughout his career, he frequently became a traveller on similar professional errands. To the last, honours continued to flow upon him. In 1842, he was made Commander of the Legion d'Honneur; and in the Universal Exposition of 1855, the grand Medal of Honour was awarded to him. He died January 17, 1863. He left behind him no children; his only daughter, wife of the celebrated Paul Delaroche, having died in 1845.

Though he by no means exclusively confined himself to military subjects, as witness his well-known 'School of Raphael,' 'Judith and Holofernes,' and many others, it is on his consummate treatment of these that his fame mainly rests; and in this particular department, though he has many worthy competitors among his countrymen, no one of them can be said to equal him. With the utmost skill in effective composition, he combines in these works a surprising dash, vigour, and truthfulness; the movement and veritable fiery life of conflict is expressed in them with amazing effect. In the London International Exhibition of 1862, some good specimens were exhibited.

VERNIER, a scale, by which linear or angular

magnitude can be read off with a much greater degree of accuracy than is possible by mere mechanical division and subdivision, derives its name from its inventor, Pierre Vernier, 'Capitaine et Chastellaine pour sa Majesté au Chasteau Dornans,' who gave a description of it in a tract published at Brussels in 1631. The principle of this invention is essentially as follows: AB (fig. 1) is a portion of the graduated scale of an instrument

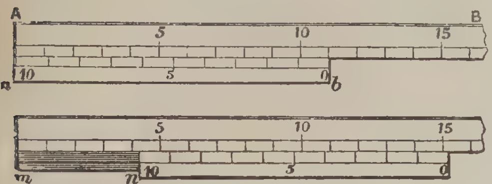

Fig. 1.

shewing divisions and subdivisions; *ab*, a small scale (called the *vernier*), made to slide along the edge of the other, and so divided that *ten* of its subdivisions are equal to *eleven* of the smallest divisions of the scale AB; then each division of the vernier is equivalent to $1\frac{1}{10}$th of a subdivision of AB; and consequently, if the zero-point of the vernier be (fig. 1. A) opposite 11 on AB, the 1 on the vernier is at $9\frac{9}{10}$ ($1\frac{1}{10}$ below 11), 2 on vernier is at $8\frac{8}{10}$ ($2\frac{2}{10}$ below 11), &c. Also, if the vernier be slid along so that 1 on it coincides with a division on the scale, then 0 on the vernier is *one*-tenth above the next division on the scale; if 4 on the vernier coincide with a division on the scale, the 0 of the vernier is *four*-tenths above a division. The vernier is applied to instruments by being carried at the extremity of the index-limb, the zero on the vernier being taken as the index-point; and when the reading-off is to be performed, the position of the zero-point, with reference to the divisions of the scale, gives the result as correctly as the mechanical graduation by itself permits, and the number of the division of the vernier which coincides with a division of the scale, supplements this result by the addition of a fractional part of the smallest subdivision of the scale. Thus (fig. 1, B), suppose the scale-divisions to be degrees, then the reading by the graduation alone gives only a result between 15° and 16°; but as the 2d division of the vernier coincides with a graduation on the scale, it follows that the zero-point is $\frac{2}{10}$ths of a division above 15°, and that, therefore, the correct reading is 15°·2. It will be at once seen that by merely increasing the size of the vernier, as, for example, making 20 divisions of it coincide with 21 on the scale, the latter may be read off to $\frac{1}{20}$ths; and a still greater increase in the size of the vernier would secure further accuracy.

The above is the vernier as proposed by its inventor, and as it was employed for long after his

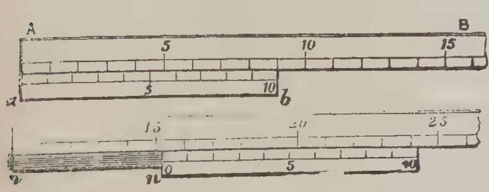

Fig. 2.

time; but in the more recently constructed astronomical and geodesical instruments, a vernier is employed which has one graduation *more* (fig. 2) than the corresponding portion of the scale. A little consideration will shew that the only effect of this modification is to enable the vernier to be graduated towards the same direction as the scale, and thus save a little confusion in the reading off. In small instruments, or where the utmost accuracy is required, a small magnifying lens is fixed over the vernier, to enable the observer, in cases where no two graduations coincide (which is generally the case), to estimate the amount of error introduced by assuming that the two graduations which approach nearest to coincidence actually coincide.

Of the various methods for subdivision which were in use before the introduction of the vernier, the most important were the *Diagonal Scale* (q. v.) and the *Nonius*. The latter, so called from its inventor, Petrus Nonius (Pedro Nunez), a Portuguese mathematician, who described it in a treatise *De Crepusculis Olyssipone*, published in 1542, consists of 45 concentric circles described on the limb, and divided into quadrants by two diameters intersecting at right angles. The outermost of these quadrants was divided into 90, the next into 89, the third into 88, &c., and the last into 46 equal parts, giving on the whole a quadrantal division into 2532 separate and unequal parts (amounting on an average to about 2′ intervals). The edge of the bar which carried the sights passed, when produced, through the centre, and served, consequently, as an index-limb; and whichever of the 45 circles it crossed at a graduation, on that circle was the angle read off; for instance, if it cut the 7th circle from the outside at its 43d graduation, the angle was read off as $\frac{43}{84}$ths of 90°, or 46° 4′ $17\frac{1}{7}''$.

VERNON, a small town of France, in the dep. of Eure, stands on the left bank of the Seine, 50 miles west-north-west of Paris by the Havre, Rouen, and Paris Railway. It contains a handsome Gothic church, and numerous picturesque old houses with wooden frameworks, and is the seat of some trade in grain.

VERO'NA, an ancient and interesting city of Northern Italy, in Venetia, stands on a plain at the foot of the hills which lie at the base of the Tyrolese mountains, 72 miles west of Venice by railway. It stands on the Adige, by which it is divided into two unequal parts, connected by four bridges. The aspect of the town, and of rich landscape around, is considered remarkably fine. V. is a fortress of the first rank, a member of the famous Quadrilateral (q. v.), and has always been considered a place of strength since it was surrounded with walls by the Emperor Gallienus, 265 A. D. Its modern fortifications are amongst the most extraordinary works of military engineering in Europe. After passing into the hands of the Austrians in 1815, it was greatly strengthened; and since 1849, every effort has been made to render it impregnable. Of its many interesting edifices, the chief is the amphitheatre, built, it is supposed, between the years 81 and 117 A. D. The building has been wonderfully preserved, the interior being still, to all appearance, complete. The lesser diameter of the building is 404 feet, that of the arena 146 feet; and the edifice is calculated to have contained 22,000 people. This, as well as many of the other structures of the city, has a handsome appearance, owing to having been built of Verona marble. The Porta dei Borsari and the Arco de Leoni are fine Roman gateways, both of the imperial age. The streets of V. are wide, especially the Corso; there are four principal squares, of which the Piazza dei Signori contains the palace of the Della Scala and the superb Palazzo del Consiglio, the façade of which is adorned with bronze and marble statues of celebrated natives of V., including Catullus, Pliny

the Younger, &c. The picture-gallery contains about 400 specimens, including a Transfiguration by Titian, and a full-length portrait and a Deposition by Paul Veronese. The cathedral, the date of which is uncertain, but which is attributed to Charlemagne, has a handsome porch, guarded by the celebrated paladins, Roland and Oliver. The more modern parts of the cathedral are exceedingly rich, and among other excellent works of art, it contains a famous Assumption by Titian. Altogether, there are in V. about 40 churches, many of them beautiful specimens of Gothic architecture, and containing valuable paintings and other art treasures. The palaces are also numerous and fine; and there are several theatres, hospitals, &c. Manufactures of woollen goods, hats, cotton, silk, hemp, and hosiery are carried on; and the town trades considerably with Venice in garlic sausages. Excellent cattle are reared on the rich pasturage of the vicinity. Wines and fruit are good and abundant. Pop. (1879) 66,151.

The early history of V. is involved in obscurity, and there is some difficulty in determining whether it originally belonged to the Euganei or the Cenomani. It afterwards fell into the hands of the Romans, and under the Empire became one of the most flourishing cities in the north of Italy. Constantine took it by assault in 312; Stilicho defeated the Goths here in 402. Charlemagne took possession of it, and made it the royal residence of his son, King Pepin. The Montagues, who were Ghibellines, lived here in perpetual and deadly enmity with the Guelf Capulets; and from the contentions that took place between these families, Shakspeare—drawing upon an Italian authority—has derived materials for his tragedy of *Romeo and Juliet*. In 1259, the town received Mastino della Scala as its ruler. In 1405, the city gave itself over to Venice, in order to free itself from its tyrants, who were alternately of the Scala, the Visconti, or the Carrara families, and has since shared the vicissitudes of the rest of Venetia.

VERONESE, Paul. See Cagliari.

VERO'NICA, the name of a supposed saint of the Roman Catholic Church, whose history, and indeed whose historical existence, has been the subject of much controversy. According to the legend, V. was one of the women who met our Lord on his way to Calvary; and as he was sinking, overpowered by fatigue, under the weight of the cross, V. offered him her veil, to wipe the sweat from his brow, when, wondrous to tell, the divine features were miraculously impressed upon the cloth, and remained as a permanent picture of the face of our Lord. This miraculous picture is reported to have been preserved in Rome at St Peter's Church from about the year 700. Another, of similar appearance, is preserved at Milan; and many Catholic writers, among whom are the learned Mabillon and Papebrook, have supposed that whatever is to be said of the legend of the pious woman at Jerusalem, the name 'Veronica' is but founded on an erroneous application of what in reality was meant to designate not the personage, but the picture, which was described as *vera icon* (Gr. *eikon*), 'the true image' (i. e., of Christ). Other writers, however, are of opinion that V. is a real name, and designates a real personage, although probably erroneously applied in this legend. The picture has been frequently reproduced both in painting and engraving; the most celebrated of the former is one by the great Spanish painter Morales, surnamed 'the Divine,' from his favourite subject, which was the countenance of our Lord in the 'Ecce Homo' and similar subjects.

VERONICA. See Speedwell.

VERSAILLES, a celebrated city of France, and long the residence of the French court, capital of the dep. of Seine-et-Oise, stands on a plain, 11 miles south-west of Paris by railway. A fine avenue, which forms part of the road from Paris, divides the town into two parts. The town covers a large area in proportion to its population, and is of remarkably regular construction, consisting of long and straight streets, crossing at right angles. V., a city more of pleasure than of industry, long accustomed to find its sustenance in the expenditure of a luxurious court, and at the present day a place of residence for many foreigners, attracted hither by the salubrity of the climate, the fine promenades, and the economy of living, as compared with that in Paris—has few manufactures, and little trade. It is the see of a bishop, and contains a public library of 50,000 vols., many palatial edifices, public fountains, spacious squares, and elm-planted avenues; and when taste in architecture and in landscape-gardening was more formal than at the present time, the town was esteemed the handsomest in Europe. The great attraction of V. is its palace, and the history of this structure may be said to be the history of the town. The site occupied by the palace is known to have been that of the ancient priory of St Julien, the chronicles of which place the date of the building in the early times of the Capetan monarchy. Later, the priory became a feudal stronghold, and its first superior, *Hugo de Versaliis*, lived in the 11th century. In 1570, the manor belonged to Martial de Léoménie, one of the victims of St Bartholomew. The building was converted by Louis XIII. into a château; and Louis XIV. devoted enormous sums to its embellishment, or rather reconstruction. Louis XV. altered the arrangement of the interior and meditated alterations that would have changed the whole character of the edifice, but which he was unable to carry out from want of money. Under Louis XVI., V. continued to be one of the usual residences of the court down to the period of the Revolution, which great event had its beginning here in the meeting of the States-general, in May 1789. Louis Philippe transformed the palace of Louis XIV. into a museum to contain trophies of the victories of France. The approach to the palace is by the *Place d'Armes* and the *Cour d'Honneur*, in the latter of which is a large equestrian figure of Louis XIV. and other statues. The entire length of the palace is nearly 1400 feet. The collections embrace pictures of celebrated events in French history, portraits of French heroes, &c. The most interesting pieces of art are the pictures by David which illustrate the career of Napoleon, and those by Horace Vernet. The gardens, with their broad terraces and long alleys, are imposing, but formal; the fountains are on the grandest scale. From the middle of September 1870, till the conclusion of peace, in 1871, V. was the centre of all the operations of the Germans On September 20 King William and the Crown Prince entered the town; and there, on January 8, 1871, the former was proclaimed emperor of Germany. On January 28 the capitulation of Paris was signed in V. After the peace it became the seat of the National Assembly and government of the republic, and was the headquarters of the army under General MacMahon. Pop. about 50,000.

VERSE (Lat. *versus*, from *verto*, to turn, a turning of the plough, a furrow; a row; a line in writing and in poetry), a section or group of metres written in one line. See Metre, Rhime. The term Verse is often erroneously applied to a group of lines or verses, which is properly a stanza. Verse is often used to signify metrical composition.

VE'RSECZ, a fortified town of the Temesvar Banat, stands on the Versecz Mountains, 45 miles south of Temesvar by railway. It is the seat of a Greek Non-united bishop. The chief industry is the production of silk, wine, and rice. Pop. 17,800.

VE'RSICLE (Lat. *versiculus*, a little verse), a short verse in the service, which is spoken or chanted by the priest or minister alternately with a 'response' by the people.

VERSIONS. See BIBLE.

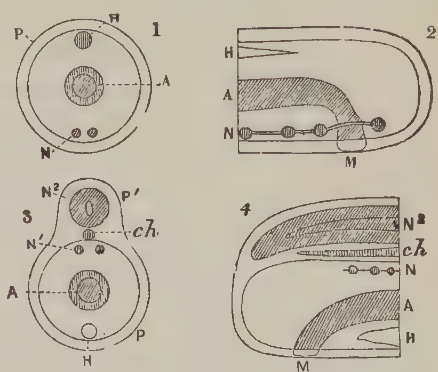
VERST, or **WERST**, in Russian, *wersta*, an itinerary measure, equivalent to 1166¼ yards, or about two-thirds of an English mile.

VERT. See HERALDRY.

VE'RTEBRÆ. See SPINAL COLUMN and SKELETON.

VE'RTEBRATA, the highest and most important of the animal sub-kingdoms, characterised by the universal presence of a backbone, composed of a varying number of small bones called vertebræ (see SKELETON and SPINAL COLUMN), which at once serve for the general support of the other parts, and for the protection of the central part of the nervous system (the brain and spinal cord) in a closed cavity in the interior.

We shall notice first the developmental and then the structural peculiarities of the vertebrates. Like the members of the other sub-kingdoms, the vertebrates begin in a semi-fluid nitrogenous substance called plasma, which separates itself (or differentiates, as it is scientifically termed) into albumen, fibrin, primary membrane (the lemma of Owen), nuclei, and cells, in which form, says the above-named physiologist, 'the individuality of the new organism first dawns as a nucleated germ-cell, or germinal vesicle.' The formation of yolk by the evolution of albuminous granules and oil-particles from the plasma, and the development of an outer layer of membrane, complete the unimpregnated egg. For further development, another principle, the spermatozoon, or product of the sperm-cell, is required. Its reception by the egg is followed by the formation of a germ-mass, which is formed by consecutive divisions, cleavages, or segmentations of the impregnated centre, which incorporates more or less of the yolk. Thus far there is no difference between the vertebrate and the invertebrate germ. The next step, to use the words of Professor Owen, 'impresses upon the nascent being its *vertebrate* type.' As has been shewn in the article DEVELOPMENT OF THE EMBRYO, the parietal portion of the germ becomes raised up on each side into a ridge, so that a long groove or furrow is formed between these parallel ridges (see figs. 6, 7, 8 in DEVELOPMENT); and the margins of these subsequently uniting with one another, constitute a tube, in the interior of which the vertebrate cerebro-spinal nervous centres are developed. In the meantime, the margins of the germs extend downwards over the yolk till they meet and form the abdominal cavity. Hence, in the vertebrates, there are developed from the *chorda dorsalis*, or *notochord* (see DEVELOPMENT), 'a pair of plates "neurad," * to enclose the nervous axis, and a pair of plates "hæmad," † to enclose the vascular axis and organs of vegetative life. Flesh and skin co-extend with the enclosing plates. This formation of two distinct parallel cavities—neural and hæmal—under symmetrical guidance, in the vertical or "neuro-hæmal" direction, with a repetition of parts on the right and left sides, establishing transverse or "bi-lateral" symmetry, constitutes the chief developmental characteristics of the vertebrate animal.'—Owen's *Anatomy of Vertebrates*, vol. i. p. 2. The accompanying diagrams, which we have borrowed from Professor Huxley's *Elements of Comparative Anatomy*, may tend to render this subject more intelligible. In the invertebrates, merely a single saccular or tubular investment is formed, which encloses all the viscera; so that, provided we select one high enough to possess a heart and nervous system—the transverse and longitudinal sections would be represented by 1 and 2, while P



Diagrams representing generalised sections of one of the higher Invertebrates (1, 2) and of a Vertebrate (3, 4).

1, 3, transverse; 2, 4, longitudinal section; A, alimentary canal; H, heart; P, parietes of the body; P′, parietes of neural canal; N, nervous centres of Invertebrate; N′, sympathetic, and N², cerebro-spinal centres of Vertebrate; *ch*, notochord; M, mouth.

represents the parietes, or wall of the body, A the alimentary canal, M the mouth, H the heart, and N the nervous centres. 'It will be observed,' says Professor Huxley, 'that the alimentary canal is in the middle, the principal centres of the nervous system upon one side of it, and the heart upon the other. In none of these animals, again, would you discover in the embryonic state any partition formed by the original external parietes of the body between the nervous centres and the alimentary canal.'—*Op. cit.*, p. 59. But the vertebrate, after it has passed through its very earliest stages of development, is, as we have seen, not a single, but a double tube; and the 'two tubes are separated by a partition, which was, primatively, a part of the external parietes of the body, but which now lies in a central position between the cerebro-spinal nervous centres and the alimentary canal. Hence a transverse section of any vertebrated animal may be represented diagramatically by fig. 3, where, for the most part, the letters have the same signification as in the foregoing case, but where P′ denotes the second or cerebro-spinal tube. The visceral tube (P) contains, as in the case of the invertebrate animal, the alimentary canal, the heart, and certain nervous centres belonging to the so-called sympathetic system. This nervous system and the heart are situated upon opposite sides of the alimentary canal, the sympathetic corresponding in position and in forming a double chain of ganglia with the chief nervous centres of the invertebrata; so that the cerebro-spinal tube appears to be a superaddition—a something not represented in the invertebrate series. In close connection with the profound difference between the chief nerve-centres of the vertebrate and the invertebrate, is another remarkable structural contrast. In all the higher invertebrates, with a well-developed nervous system, the latter is perforated by the gullet, so that the mouth is situated

* Backward in man, upward in beasts.
† Forward in man, downward in beasts.

upon the same side of the body as the principal masses of the nervous system; and some of the ganglia of the latter lie in front of, and others behind the œsophagus. A longitudinal section of such an animal may therefore be represented by fig. 2. A similar section of a vertebrated animal shews, on the contrary, the chief centre of the nervous system not to be perforated by the œsophagus, the latter turning away from it, and opening upon the opposite side of the body (fig. 4).'—*Op. cit.*, p. 60. No structures having any analogy to the *chorda dorsalis*, or *notochord*, or to the *visceral arches* and *clefts* (see SKELETON), are to be found in the embryonic condition of any of the invertebrates.

Passing on from the developmental to the structural differences, we universally have the vertebral column and the nervous centres, consisting of brain and spinal cord; and the organs of the five senses are usually present. All possess a distinct vascular system, containing blood, with red and white corpuscles in suspension, and in all (with the solitary known exception of the *amphioxus*, or Lancelot), there is a compact muscular heart of two or more cavities, and provided with valves. The breathing organ communicates with the pharynx. The alimentary canal has two apertures, usually at opposite ends of the trunk, the mouth or reception aperture never being formed of modified limbs, or working horizontally, as in the *Articulata*, but provided with two bony jaws, placed one above the other, and acting vertically.

All vertebrates possess a hepatic portal system, by which the blood of the alimentary canal is collected into a portal vein, which ramifies through the liver. The limbs may be totally absent, or one or two pair, never more. The muscles surround the bony levers on which they act, and thus, under the influence of the will, move the limbs and other parts. The sexes are distinct.

Comparative anatomists differ in their division of the vertebrates into classes, and as to the best basis of classification. Professor Owen, in his *Anatomy of Vertebrates*, admits of only four classes, viz., Fishes, Reptiles, Birds, and Mammals; whereas Milne-Edwards, Huxley, and many of our leading authorities, separate the Amphibians from the Reptiles, and assign them a class by themselves. Professor Owen, after describing the modifications of the piscine, reptilian, avian, and mammalian types, observes that the vertebrates might be binarily divided into oviparous and viviparous; into anallantoic or branchiate, and allantoic or abranchiate; into *Hæmatothermal* (Gr. *haima*, blood, *thermos*, hot), having four-chambered heart, spongy lungs, hot blood, and *Hæmatocryal* (Gr. *haima*, blood, *cruos*, cold), having less perfect breathing organs, less complex heart, with cold blood; and adopts the latter. Huxley, on the other hand, after noticing the division of the vertebrates into *Branchiate* and *Abranchiate*, and pointing out the non-homogeneous character of the abranchiates—Mammals being so strongly separated from Birds and Reptiles—suggests the removal of them to an independent position. 'Thus,' he observes, 'the classes of the *Vertebrata* are capable of being grouped into three provinces: (1.) The ICHTHYOIDS (comprising Fishes and *Amphibia*), defined by the presence of branchiæ at some period of existence, the absence of an amnion, the absence of a rudimentary development of the allantois, nucleated blood-corpuscle, and a parasphenoid bone in the skull: (2.) the SAURIANS, defined by the absence of branchiæ at all periods of existence, the presence of a well-developed amnion and allantois, a single occipital condyle, a complex mandibular ramus, articulated to the skull by a quadrate bone, nucleated blood-corpuscles, and no parasphenoid, comprising Reptiles and Birds: and (3.) the MAMMALS, devoid of branchiæ, and with an amnion and an allantois, but with two occipital condyles, and a well-developed basi-occipital, and no parasphenoid, a simple mandibular ramus, articulated with the squamosal, and not with the quadratum, with mammary glands, and with red non-nucleated blood-corpuscles.'—*Op. cit.*, p. 74.—For further details, the reader may consult Stannius's *Comparative Anatomy of the Vertebrata* (in German), Wagner's *Comparative Anatomy of the Vertebrata*, translated from the German by Tulk; the works of Huxley and Owen quoted in this article; and the special departments of Cuvier's *Règne Animal*, and Blanchard's *L'Organisation du Règne Animal*, now in course of publication—a work which, if ever completed, will rival Cuvier's *opus magnum*.

VERTI'GO, in Medicine, designates a sensation which the patient describes as one of going to fall, or of turning round, or of everything turning around him. It comes on without premonitory symptoms, excepting a sense of disturbed balance, which may either precede, accompany, or follow it. Associated with it are frequently some of the following symptoms: flashes of light before the eyes, buzzing in the ears, painful sensations in the head, nausea, vomiting, trembling with cold perspirations, muscular tremors, a full, slow, or small and frequent pulse, flushing or pallor of the face, and cold feet.

Giddiness and *dizziness* are only other names for vertigo, although giddiness is commonly applied to its milder forms. Attacks of it come on in paroxysms, usually repeated several times a day, and lasting from a few minutes to a quarter of an hour. This disease is frequently chronic, the chief predisposition to it being in middle and advanced age. Childhood is nearly exempt from it, an observation in accordance with the well-known fact, that children can bear rapid rotatory movements without the induction of giddiness better than adults. A plethoric constitution, especially if associated with a sedentary mode of life, the so-called change of life in women, the debility brought on by exhausting discharges, and the abuse of spirituous liquors, may be regarded as predisposing causes to this affection. The direct cause of vertigo is doubtless an irregularity of the supply of blood to the brain. Hence any condition that occasions either an increase or diminution in the supply of blood, is followed by vertigo. For example, it commonly accompanies disease of the heart, and especially hypertrophy of the left ventricle; it is also induced by suppressed hæmorrhoids, or other constant form of discharge or loss of blood. Injuries and diseases of the brain, and especially of the cerebellum, are often accompanied by this symptom, and so also are diseases of the spleen. Amongst the most common exciting causes are intoxication, not only from alcoholic drinks, but from narcotics, such as smoking tobacco, inhaling carbonic acid gas, or semi-poisoning by belladonna, digitalis, hyoscyamus, &c., gorging the stomach with indigestible food (especially if highly carbonated drinks are at the same time taken); unusual movements or positions of the body, and especially of the head, as in sea-voyages, continued stooping, &c.

There is a peculiar kind of vertigo which occurs in dreams. The direction of the apparent movement is generally from above downwards; dreams of tumbling down stairs being, according to Romberg, the most common; people also dream of sinking into the earth, of chasms opening before them, &c.

According to Boerhaave, 'vertigo is the most easily cured of all the diseases of the head.' This statement is too positive; the vertigo that is caused by profuse discharges and exhaustion is curable,

while it is beyond the aid of treatment when it accompanies cerebral disorganisation. The *treatment* of course depends upon the cause; while in some cases tonics (the mineral acids, small doses of nux vomica, quassia, &c.) are required, in others, the local abstraction of blood from the nape of the neck, cold affusion, &c., are required. The following rules are, however, generally applicable for the treatment of patients subject to giddiness. They should avoid violent, continuous, or rotatory exercise, abstain from highly nutritious or heating articles of diet, and from suppers; they should not indulge in much sleep, r the use of feather-beds, or of warm baths. Counter-irritation to the skin by sinapisms, foot-baths with mustard, the use of the flesh-brush, with cold washing of the body, and the administration of cooling laxatives, are to be recommended. (A good laxative of this kind is obtained by mixing six drachms of sulphate of magnesia [Epsom salts] with two drachms of carbonate of magnesia, and taking a tea-spoonful three times a day.) When the patient feels the attack coming on, Romberg directs that he should 'direct his full attention to movement. The patients do this, in a measure, of their own accord, by supporting themselves firmly with their hands and feet, in order to resist the illusory movement. The sense of vision may be employed for the same purpose; thus, the vertigo produced by rotatory movement of the body may be suppressed by looking steadily at the finger held up to the eye, or by turning round in a direction opposite to the previous movement.'—*On Diseases of the Nervous System*, Syd. Soc. Ed. vol. i., p. 102.

Few of our readers are probably aware of the remarkable vertiginous conditions which they can artificially induce in their own persons. Purkinje, the well-known anatomist and physiologist, was the first who brought these remarkable facts within the range of experimental science in two Memoirs published in 1820 and 1827. Vertical vertigo is thus produced. The experimenter—who must be standing—has a somewhat heavy weight attached to each hand, and as he carefully watches the sensation produced by gravitation for some time, he feels the weights growing heavier and heavier, till he can no longer bear them. On putting them down, when he feels he can bear them no longer, it appears to him as if he was impelled to mount straight upwards, and as if the arms were shortened, and the hands must creep up to the thorax. Similar experiments with the muscles of the eye afford still more striking results. 'If the face,' says Purkinje, 'be turned to the ceiling, and the eye be fixed on a given point, round which, as the pole of a vertical axis, the body is turned a certain number of times, the visible objects of the ceiling, as well as the floor of the room, will, if the position of the head and the direction of the eyes be maintained, appear to move in a horizontal direction. If, during the proceeding, the head be brought back into the ordinary upright position, the horizontal will be turned into vertical vertigo; and this sensation will be communicated to the tactile sense of the hands and feet, the floor appearing to sink down on one side, and to rise on the other.'—See Rust's *Magazine*, &c., 1827, vol. xxiii. p. 290.

An analogous effect is produced by standing on the brink of, or in, a running stream, and fixing the eyes on the water; after a time, the sensation begins all at once of being borne along against the current. When this sensation comes on in wading in a river, it is very difficult to keep one's feet; and hence it is dangerous to let the eyes rest on the current close by.

Hitherto, we have spoken of vertigo merely as a sensation; but there are certain morbid conditions of the brain, and certain operations which experimental physiologists can perform upon it, that will give rise to what may be termed *vertiginous movements*, if we include under the term vertigo *straight* as well as circular movements, as is usually done by writers on this subject. From the experiments of Magendie and Flourens, which have been confirmed by Krauss and Hertwig, it follows that: 1. Removal of both corpora striata of the brain induces an irresistible tendency to advance, the animal shooting straight forward like an arrow; 2. Slicing the cerebellum, whether horizontally or vertically, causes the animal to walk backwards; 3. Section of the corpora quadrigemina of one side, and of one side of the pons varolii, excites rotatory movements and gyrations of the animal towards the injured side; while division of the corresponding parts on the opposite side restores the balance. Vertiginous movements consequent on disease were described by the veterinary surgeons in sheep before they were noticed in the human subject. The *Cœnurus cerebralis*, which is now known to be the larva of a species of tapeworm (*Tænia cœnurus*) infesting the dog, is the well-known hydatid in the brain of sheep, producing in that animal the disease known under the various names of staggers, turn-sick, goggles, rotatory disease, &c. How this hydatid excites these movements when it destroys certain parts of the brain, is now explained by the experiments previously noticed. Dr Romberg has collected a number of very interesting cases of vertiginous movements in the human subject.—On this subject, in addition to Romberg's work, the reader may consult a paper by Dr Paget, 'On Morbid Rhythmical Movements,' in the *Edin. Med. and Surg. Jour.*, 1847, vol. lxvii.; and the remarks of Dr Carpenter (in criticism of some of Magendie's conclusions) on the Cerebellum and its Functions in his *Human Physiology*.

VERTUE, George, distinguished as an English engraver and antiquary, was born in London in the year 1684, of poor but respectable parents. At the age of 13, he was set to study under an eminent French engraver there; subsequently, he became a pupil of Michael Vandergucht, with whom he remained seven years, and in 1709, he commenced business for himself. He was generously befriended by Sir Godfrey Kneller, the great portrait-painter of the day, who did much to procure him employment. His talent soon made itself recognised; and his eminent success in an engraved portrait of Archbishop Tillotson, for which he received a commission from Lord Somers, at once placed him in the very front rank of his profession. In 1711, on the institution of the Academy of Painting, with his friend Sir Godfrey Kneller as president, he enrolled himself as a member; but his contributions were few and unimportant. In his own more special department, he wrought through life assiduously, confining himself for the most part to reproductions of the portraits of Kneller, Richardson, and one or two others of the more eminent painters of the day. On the accession of George I., he issued a large engraved head of that monarch, which had an immense run, much increasing his reputation with the public. Himself, from an early period, devoted to antiquarian research, which from time to time he prosecuted in journeys hither and thither throughout England, he was appointed, in 1717, Engraver to the Society of Antiquaries, in which capacity he worked up to the time of his death, which occurred on 24th July 1756. He lies buried in the cloisters of Westminster Abbey. In addition to his eminence in his art, he was a man of considerable general

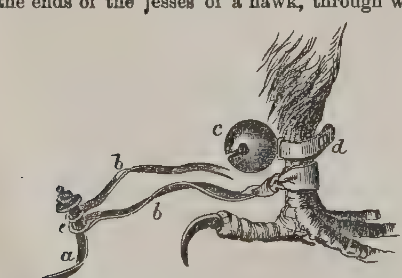
accomplishment; an adept in drawing and music, and with a competent knowledge of the French, Dutch, and Italian languages. He projected a *History of the Arts in England*, and had accumulated masses of material for it. At his death, his manuscripts were bought by Walpole, who made free use of them in his *Anecdotes of Painting in England.* In a supplementary volume of that work, entitled *A Catalogue of Engravers who have been born or resided in England*, a full list of his works is given, with some interesting notices of his character, the genuine unassuming worth of which is indicated in an unaffected expression of respect, of rather more than usual significance, as coming from the caustic and supercilious Walpole.

VERTU'MNUS. See POMONA.

VE'RVAIN (*Verbena*), a genus of plants of the natural order *Verbenaceæ*, with a 5-cleft calyx, one division a little shorter than the rest, the limb of the corolla irregularly 5-lobed, the stamens (4 or 2) included within the corolla, the fruit a 4-seeded utricle, which soon breaks, so that the ripe fruit consists of four adherent achœnia. The species are herbaceous plants and small shrubs, with undivided, trifid, or multifid leaves, natives chiefly of the warmer temperate parts of the world. The Common V. (*V. officinalis*), a perennial plant, with erect somewhat hispid stem, rough lanceolate inciso-serrate or trifid and laciniate leaves, and filiform spikes of pale lilac flowers, is a native of Britain and of most of the temperate countries of the world. It is a common ornament of flower-borders, continuing to blossom all summer. It had at one time a very high reputation as a medicinal plant, but its virtues are now regarded as imaginary. It has also been connected with some of the superstitious rites of different nations, as of the Greeks and Romans, the ancient Persians, and the British Druids.—A number of species of V., chiefly American and East Indian, are occasionally cultivated for the beauty of their flowers.

Verbena officinalis.

VE'RVELS, or VARVELS, small rings attached to the ends of the jesses of a hawk, through which



a, the end of leash; b, b, the jesses; c, the bell; d, the bewit; e, the varvels of silver, with owner's name and address engraved.

a string was passed to fasten them to its leg. They occur as a heraldic charge.

VERVIERS, a prosperous manufacturing town of Belgium, in the province of Liége, most picturesquely situated on the river Vesdre, 15 miles east-south-east of Liége, on the Brussels and Cologne Railway. It is of recent growth, and being composed wholly of workshops and of the dwellings of the manufacturers and their workmen, there are no remarkable objects of attraction. V. is the great centre of the second-rate cloth-manufactures in Belgium. In and around the town, there are 60 cloth-mills, employing 40,000 hands and 155 steam-engines. The exports of cloth to Switzerland, Italy, and America are valued at £1,000,000 a year; and the goods, which are chiefly coarse woollens, are said to be better and cheaper than those of either France or England. The waters of the Vesdre possess qualities which render them admirably fitted for dyeing. Pop. (1879) 40,362.

VESALIUS, ANDREW, the celebrated anatomist, was a native of Brussels, where he was born in 1514. He studied classics at Louvain, and anatomy and medicine first at Cologne, then at Montpelier, and finally at Paris, where his preceptors were Gunther, Sylvius and Fernelius. So keen was his love of dissection, that in order to procure subjects (at that time no easy matter), he ran considerable risks at the hands of the municipal authorities. Driven from Paris by the outbreak of war between Francis I. and Charles V., he returned to the Low Countries, where he served as physician and surgeon in the imperial army from 1535 to 1537. In 1539, he went by invitation to Pavia, where he taught anatomy till 1543. From Pavia he went, again as a lecturer in anatomy, to Bologna and Pisa; and in 1544 was made physician-in-chief to Charles V. at Madrid, where he continued mainly to reside. He was now at the zenith of his prosperity, when an accident befel him which brought his career to a premature and disastrous close. A Spanish gentleman died in 1564, and permission to dissect the body was granted by his relatives to Vesalius. Life, however, was ascertained to be not quite extinct when V. began the operation, the heart being found still palpitating. The family of the deceased, with inconsiderate vindictiveness, arraigned V. before the Inquisition, by which tribunal some terrible sentence would have been passed upon him, but for the interposition of Philip II., who procured for the unfortunate anatomist the milder penalty of an injunction to make a pilgrimage to the Holy Land. V., accordingly, in the train of the Venetian General Malateste, proceeded to Cyprus, and thence to Jerusalem. While sojourning in that city, he was invited to occupy the chair of Anatomy, just vacated in Padua by Fallopius. It is supposed that, in compliance with this invitation, he embarked for Europe; but the ship in which he sailed was wrecked on the shore of Zante. Hunger and misery of mind proved too much for him, and he died in a village of that island in 1564.

V. was one of those men of science who contributed to disenthral the minds of his contemporaries from their servile belief in the ancients. Galen was then to anatomy what Aristotle was to logical method; and V. assailed his authority by independent researches into nature. His first great publication was a series of anatomical tables entitled *Suorum Librorum de Corporis Humani Anatome Epitome* (Basel, 1542, fol.). The plates, from drawings by the best masters, and engraved on wood, were nearly all re-incorporated in his great work *De Corporis Humani Fabrica Libri Septem* (Basel, 1543). Great value is placed on the earliest impressions of these plates, the explanations of which, however, were revised by V. in his second (Basel) edition in 1555. He published in 1546 his severe attack on the errors of Galen's anatomy, the well-

known *De Radicis Chinæ usu Epistola.* The cause of Galen was then espoused by Galen's disciple, Fallopius, to whom V. replied in his trenchant *Anatomicarum Gabrielis Fallopii Observationum Examen* (1561). After his death, a work entitled *Chirurgia Magna*, published under his name, but really a compilation from the ancient anatomists, was edited by his disciple Borgarucci. The great edition of V.'s works appeared with fine plates at Leyden in 1725, 2 vols. fol., under the superintendence of Boerhaave and Albinus.

VE'SICANTS, or BLISTERING AGENTS, are substances which, if kept in contact for some time with the surface of the body, excite such irritation as to cause the effusion of serum from the true skin, leading to the separation and elevation of the cuticle, and the formation of a vesicle or blister. They are employed in the practice of medicine for the purpose of relieving or removing the diseased condition of some internal part, by producing a determination of blood from the interior to the surface over the seat of the affection. They likewise are of great value from their action as general stimulants to the system, and as such are often used with great benefit in the advanced stages of low continued fever. Moreover, they are not unfrequently employed for the direct purpose of withdrawing serum from the vascular system, and with this view they are prescribed with advantage in cases of sudden effusion into the pericardium or the pleura. Blisters used with this object should be of large size, and should be kept in contact with the skin sufficiently long to produce their full effect (twenty-four hours being in some persons necessary for that purpose). Lastly, vesicants are occasionally applied to the surface of the body, for the purpose of removing the cuticle, so as to permit the direct application of various medical agents (especially mercury and morphia) to the absorbing surface of the true skin. It must be recollected that in infancy and childhood, owing to the extreme readiness with which inflammation of the skin is then set up, these agents must be used with extreme caution.

To produce vesication, *cantharidine*—the active principle of *Cantharides*, or Spanish Flies—in one of its various forms is generally employed, although other substances, afterwards to be noticed, are occasionally used. Cantharidine is a white crystalline substance, which is extracted from the powdered insects by rectified spirit, and whose composition is represented by the formula $C_{10}H_6O_4$. It is a very active poison, and produces immediate inflammation of the skin whenever it comes in contact with it, is very volatile, even at ordinary temperatures, and is soluble not only in alcohol, but in chloroform, ether, strong acetic acid, and many oils. This substance is employed in the form of plaster (*Emplastrum Cantharidis* of the *Pharm. Brit.*), blistering fluid (of which there are several excellent forms, such as *Acetum Canth.*, *Æther Canth.*, and *Collodion Canth.*, none of which are in the *Pharm. Brit.*), and blistering tissue (of which there are several forms, known as *Tela vesicatoria*, *Charta ves.*, *Blistering Cloth*,* &c., none of which are officinal). Although the fluids and tissues are the cleaner and neater preparations, the old-fashioned *Cantharides Plaster* is far the most commonly employed in general practice, and is, by many of the authorities in the profession (amongst whom we may name Professor Syme of Edinburgh, and Professor Lister of Glasgow), considered as the most efficacious (its superiority being due to its slower and more prolonged action). In prescribing a blister, it is expedient to sketch the size and shape desired. Before applying it, the skin should be well washed with warm water. If the patient's skin is not easily acted upon, the part should be sponged with vinegar; while if it is very susceptible, and he is liable to strangury from the application of blisters, a piece of tissue-paper should be placed between the skin and the plaster. (In speaking of the plaster, which is a solid mass, we assume that it is spread on some fitting material as wash-leather, soft brown paper, &c., the popular idea of a plaster always including the material on which it is spread.) In order to insure close contact with the skin, the blister should be gently warmed, carefully applied, so as to avoid creases, and kept in its place by a bandage. To produce their full action, blisters should remain from ten to twelve hours, and if on their removal after that time full vesication has not been produced, a hot bread-and-water poultice will often produce the desired effect. The raised cuticle should be punctured, to allow of the escape of the serum (except in the case of children and persons of very irritable skin, when the vesications should be left unopened), and a dressing of simple ointment or spermaceti ointment on soft rag applied, and repeated in twenty-four hours afterwards; or the part may be at once covered with cotton-wool, which, until it gives off a bad smell, can remain till the skin is healed. The troublesome *itching* which often follows the application of a blister, is best relieved by the application of a bread-and-water poultice, moistened with the dilute solution of acetate of lead, formerly known as Goulard's *Vegeto-mineral Water.* Dr Neligan, in his highly practical work *On Medicines*, speaks so strongly of *Collodium Vesicans* as a blistering agent, that although we have no personal experience of it, we shall, on his authority, briefly notice it. It is prepared, when required, by mixing together equal parts of collodium and cantharidal ether (obtained by digesting for three days one part of coarsely powdered cantharides in two parts of sulphuric ether, and expressing). It possesses the advantage that its strength can be readily increased or diminished. 'It is now much used for blistering,' he observes, 'owing to its cleanliness, its certainty, and the facility with which it may be applied in the neighbourhood of joints, or to other parts which are difficult to blister by the ordinary method. It is applied with a camel-hair pencil; two scruples are sufficient to blister a surface as large as the palm of the hand. It is preferable to apply the quantity to be used twice, instead of at one time, on the place to be blistered.'

When a blistering agent with very rapid action is required, as in the state of collapse in cholera, recourse may be had to the application of boiling or nearly boiling water* to a portion of the abdomen, the surrounding surface being protected by a wall of damp cloths; or in less urgent cases, as retrocedent gout shewing itself internally, an almost immediate blister may be produced by saturating a piece of lint of the size of the desired blister in the strong solution of ammonia, and applying it to the skin

* We have not included the well-known *Papier d'Albespeyres*, which is often sold for this purpose, because it is not sufficiently powerful. It is useful for keeping open an already blistered surface.

* Strange and paradoxical as it may appear, 'in the absence of other more suitable means, *cold water* may be used as efficiently as boiling water, and will not present so formidable an appearance to the patient. A piece of bibulous paper (common blotting-paper, for example) should be soaked in cold water, applied to the part to be vesicated, and covered with three or four folds of dry paper. A common smoothing-iron heated to 212° should now be pressed three or four times over all, and on removing the paper, the part will be found vesicated.'—Neligan, *op. cit.*, p. 325.

with moderate pressure. By the time that the ammonia has evaporated, the required result is usually obtained. When it is desired to keep up a discharge from a blistered surface (instead of healing it, as is most commonly required), or to produce a *perpetual blister*, we dress the raw surface with irritants of various kinds, such as savine ointment, *Papier d'Albespeyres*, &c. At each fresh dressing, which in summer should take place twice a day, the part should be cleansed with warm water.

VESICA PISCIS (barbarous Lat. bladder fish, bladder evolved out of a fish), a term often, but not very correctly, used for the aureole or glory, of a pointed oval shape, formed by the intersection of two circles, which, in the religious symbolism of the early middle ages, is often represented encircling the whole body of the Saviour. This form is supposed

Vesica Piscis.

to have been gradually evolved out of the figure of the fish, which is prominent in the symbolism of the early Christians on sarcophagi and elsewhere, and whose use arose out of an anagram on the initial letters of Ἰησοῦς Χριστὸς Θεοῦ· Υἱὸς Σωτήρ, Jesus Christ, son of God the Saviour. The ovoidal form, generally designated by English antiquaries the Vesica Piscis, is much used in painted glass, and became from the 12th c. the almost invariable form of the seals of ecclesiastical persons and institutions.

VESOUL, a small town in the east of France, capital of the dep. of Haute-Saône, stands in a fertile and picturesque country, overlooked by the mountain called the Motte-de-Vesoul, on the Durgeon, 236 miles east-south-east of Paris. The manufactures of the town are unimportant, but the environs are as fertile as they are beautiful; the slopes of the Motte-de-Vesoul are clad with vines; and a trade in grain, hay, and hides is carried on. Pop. about 10,000.

VESPASIA'NUS, Titus Flavius, Roman emperor, was a native of Reate, in the Sabine country, of humble origin. After serving with distinction in various military grades in Thrace, Britain, and Africa, he was sent by Nero to conduct the Jewish war. This appointment he owed to his recognised merits, for he was not a favourite with the emperor, whom he had offended by falling asleep during the recitation of one of his poetical compositions. He conducted the war with vigour, reduced Judæa, and finally laid siege to Jerusalem. At this time occurred the struggle for the imperial dignity between Otho and Vitellius, after the murder of Galba. The legions serving in the East were indignant that the empire should be disposed of at the will of the Prætorian Guards. Their own general was proclaimed emperor, and quickly acknowledged as such by all the East, and, after the death of Vitellius, by Italy and all the provinces. Leaving his son Titus to prosecute the siege of Jerusalem, he repaired to Rome, where he was joyfully received, and immediately set about the work of restoring order. He kept his soldiers under firm discipline, improved the finances, co-operated cordially with the senate in the administration, and did much by his example to lessen the ill effects of the prodigality and luxury of his predecessors. An interesting biography of him has been written by Suetonius, and from the personal anecdotes there recorded, we are enabled to estimate clearly the character of the man. He was simple and unostentatious in his mode of life, too shrewd to listen to flattery, liked a joke, was good-humoured, and easy of access. He is charged with being avaricious, and at times he certainly sought to obtain money by rather undignified ways; but though niggardly in personal expenditure, he was lavish in embellishing the city with public works, and a munificent patron of the arts and sciences. He is chargeable also with one or two acts of cruelty, but usually he bore provocation with great good temper. He died 79 A.D., in the 69th year of his age, after a reign of ten years.

VE'SPERS (Lat. *vespere*, in the evening), one of the canonical hours of the Breviary, called also anciently *Lucernarium*, from *lucerna*, a lamp. It is a service of very ancient use, being plainly referred to in the apostolical constitutions, and is noticeable as that one among the canonical hours which in the Roman Catholic Church continues to be regularly sung as one of the ordinary public services of parish churches, no less than in cathedrals where the entire of the hours are chanted. It resembles lauds, and consists of five psalms and antiphons, a lesson, a hymn with versicle and response, a canticle (the Magnificat), and a collect or prayer. The psalms sung at vespers are Ps. cix.—cxlvii., which are distributed over the several days of the week. The service of vespers has given occasion to some of the most brilliant efforts of modern musical composers. The Evening Prayer of the English Prayer-book corresponds partly with the vespers, partly with the compline (*completorium*) of the Roman Breviary.

VESPUCCI, Amerigo. See Amerigo Vespucci.

VE'STA, VE'STALS. Vesta, an ancient Latin divinity, whose worship was the embodiment of an idea, deeply rooted in the Latin, and particularly, in the Roman mind—viz., that the state was one great family. As the Lares were the tutelary guardians of the individual household, so the Penates and Vesta watched over the welfare of the state. The Greek *Hestia* (hearth) is a kindred conception; and if the word is the same, it may be conjectured that the worship of the chaste divinity that presided over domestic life goes back to a period when the Greeks and Latins were still an undivided people. The state, we have said, was regarded by the Latins as one great family, so each community had its public

Vesta.

altar to Vesta, the central one for the whole Latin people being at Lanuvium, about 20 miles from Rome, on the Appian Way, where the Roman consuls and other officers offered sacrifices on entering upon their offices. The common hearth of the Greeks was at Delphi. There was also a temple of Vesta at Rome, which stood in the Forum, near the temple of the Penates (see LARES, &c.), between the Palatine and Capitoline hills; it was open during the day, and closed during the night. On the first of March each year, the sacred fire was renewed; on the 9th June, the *Vestalia* were held in honour of the goddess; and on the 15th of that month, the temple was cleared out, and the dirt carried into a narrow lane (*angiportus*) behind the temple, which was locked by a gate, that none might enter.

The goddess herself was a virgin, and her fire was carefully tended night and day by the *Vestal* virgins. The number of these priestesses was originally four, but two were subsequently added, increasing the number to six. At first, they were chosen by the kings; but after their expulsion, by the Pontifex Maximus, who, when a vacancy had to be filled up, selected twenty damsels between the ages of six and ten years, from among whom one was chosen by lot. A father could offer his daughter for the office, if he chose, but this seldom happened. The necessary qualifications for the office of Vestal were, that the maiden should be the daughter of free-born parents, then alive and resident in Italy, and engaged in no dishonourable occupation; that she herself should not be younger than six, nor older than ten years, and free from any physical defect. The period during which the priestess was bound to the service of Vesta was thirty years, the first ten being occupied with learning her duties, the next in performing them, and the last in teaching them to others. When she entered upon her office, the Vestal took upon herself a solemn vow of chastity for the thirty years of her service, the dreadful punishment of a violation of which was, that she should be buried alive in a subterranean vault near the Colline Gate, to which she was carried on a bier, as if dead, and where she found a light, with a scanty supply of bread, water, milk, and oil. The chief duty of the virgin priestesses was to keep the fire on the altar of the goddess ever burning; they had also to present offerings to Vesta, sprinkle the temple every morning with water drawn from the Egerian well, and guard the sacred relics, which were a pledge granted by fate for the permanency of the Roman sway. As the extinction of the sacred fire was looked upon as emblematic of the extinction of the state, the Vestal who, by neglect of duty, allowed this to happen, was severely punished, the penalty being, that she should be stripped and scourged by the pontifex in the dark: the fire was again rekindled by the friction of two pieces of wood from a 'lucky tree.'

As a compensation for the strictness of the lives which they had to lead, the Vestals had many privileges bestowed upon them: among others, they were entirely freed from paternal authority; could make a will, and give evidence without taking an oath; had a seat assigned them in the best part of the theatre; were held in the greatest honour, and done homage to by the highest officers of the state; and even the plebs, in their most reckless moments, respected them. If, when out walking, their eye should chance to light upon a criminal, he was set free. At the expiration of her period of service, a Vestal, if she chose, could marry, although to do so was considered very unlucky, so that she generally ended her days in the service of the goddess.

VESTI'BULUM, a porch or ante-room, from which a house or large apartment is entered.

VE'STMENTS, SACRED, the peculiar habiliments worn by ministers of religion in the public discharge of their office, and sometimes in other sacred ministrations, even when privately performed. The use of a distinctive costume in public worship formed a part not only of the Jewish, but of almost all the ancient religions, and has been found in a greater or less degree in the religions of the new world. See Lipsius, *De Monument. et Exemp. Polit.*, l. i. c. 3. The whole 28th chapter of Exodus is taken up with a description of the vestments of the high-priest; and the directions for those of the inferior functionaries are almost equally minute. Whether the same characteristic was carried into the early Christian worship, has been a subject of controversy; some writers being of opinion that the peculiar sacred costume which we find in use among Christian ministers from a very early period was not originally peculiar to the clergy, but was simply the ordinary costume of Rome and of the East in the first centuries, and only came to be a costume distinctive of sacred ministers, because by them it was retained unaltered, whereas in the every-day world the costume varied in fashion, in material, in colour from year to year. There seems little room, however, for doubting, that from a very early time Christian ministers did employ some distinctive dress in public worship; and Catholic writers even find traces in the beginning of the 5th c. of the practice of blessing the vestments which were destined for the public services of the church. See Binterim, *Denkwürdigkeiten*, IV. i. p. 198. From the 8th c. downward, the rituals of the West all contain formularies for the blessing of the several sacred vestments worn by bishops, priests, deacons, and lower clergy. The vestments used in the celebration of the mass by priests of the Roman Catholic Church are six in number—viz. (1) the amice, a square piece of linen, which is worn upon the shoulders, and in some of the religious orders, over the head, which latter, indeed, appears to have been the ancient mode of wearing it; (2) the alb, a long, loose-sleeved, linen gown, sometimes richly embroidered or 'apparelled' at the lower border; (3) the cincture, a linen cord tied around the waist, and confining the folds of the alb; (4) the maniple, a narrow strip of embroidered silk, worn pendent from the arm; (5) the stole, a long narrow scarf, similarly embroidered, and worn by priests around the neck, the ends being crossed over the breast or pendent in front, and by deacons transversely over one shoulder; (6) the chasuble, a loose flowing vestment, open at the sides, having a hole in the centre, through which the head passes, and falling down over the breast and back to some distance below the knees. Most of these vestments have been already briefly described. The three last named are always of the same material and colour; but this colour, which appears primitively to have been in all cases white, now, and for many centuries, varies according to seasons and festivals, five different colours being employed in the cycle of ecclesiastical services—viz., white, red, green, violet, and black. Cloth of gold, however, may be substituted for any of these, except the last. A cap, called *biretum*, is worn in approaching the altar, but is laid aside during mass. Besides these vestments, which are worn by priests during the mass, bishops in the same service use also two inner vestments, of nearly the same form as the chasuble, called 'dalmatic' and 'tunic,' as also embroidered gloves and shoes, or buskins, together with the distinctive episcopal ornaments—the pectoral cross, the mitre, the pastoral staff, or,

if archbishops, the crosier, and ring. Archbishops celebrating mass also wear the Pallium (q. v.). Deacons, at the same service, wear a robe, called dalmatic; and sub-deacons, a tunic. The sub-deacon is not privileged to wear the stole. In other public services, priests and bishops wear a large flowing cloak, called cope (Lat. *pluviale*), with a pendent cape or hood, called orfrey. In the ministration of the other sacraments, and also in administering communion, priests wear the surplice (which is but a short alb) with the stole. The vestments of the Greek priests differ considerably in their general character and effect from those of the Latin clergy, but the several portions of the costume are substantially the same as those of the Latin costume already described. The *stoicharion*, the *zoné*, the *orarion*, the *epimanikia*, and the *phelorion*, correspond respectively with the alb, cincture, stole, maniple, and chasuble. Greek bishops wear the *omophorion*, which corresponds with the later pallium. The *phelorion*, however, is so ample in its folds as to resemble the Latin cope rather than the chasuble; and the general effect of the Greek vestments, which may be said to resemble in all particulars that of the other Eastern rites, is much more picturesque.

The natural effect of the religious changes of the 16th c. was to put aside the costume at the same time and on the same grounds with the ceremonies of the existing worship. This was done, however, by the different churches of the Reformers in very various degrees. The Calvinistic worship may be said to have dispensed with vestments altogether. The Lutherans generally retained with the cassock the alb, and in some countries the chasuble. In the English Church, a variety of practice has existed. The disputes about the use of the Surplice (q. v.) have been already described. As to the rest of the costume, the first Prayer-book retained the Roman vestments with little change; and as, by a remarkable accident, the rubric of this Prayer-book has never been formally repealed, a so-called ritualistic movement in the English Church has re-introduced in some places almost every detail of the Roman costume in the communion and other services, an innovation which has in many instances been vigorously resisted.

VESTRY, in English parishes, is a meeting of the inhabitants of the parish assembled to deliberate on some matter which they have a right to decide (see PARISH). The vestry is the regular organ through which the parish speaks; and in numerous matters relating to church-rates, highways, baths and wash-houses, and other sanitary matters, it has important functions to discharge, and is a conspicuous feature of parochial management. A statute was passed in 1818 to regulate the mode of procedure. No vestry, or meeting of inhabitants in vestry, shall be held until public notice of the place and hour of meeting be given, as well as of the special purpose of such meeting. This notice is required to be given by publishing it on some Sunday during, or immediately after, divine service, by affixing a written or printed copy on the principal door of the parish church or chapel. Such notice is to be previously signed by a churchwarden of the church or chapel, or by the rector, vicar, or curate of the parish. These meetings were formerly held in the vestry-room of the church, hence the name given to the meeting itself. In large parishes, the vestry-room of the church was found too small; and wherever the population exceeds 2000, the vestry may apply to the Poor-law Board to have some room, or other place of meeting than the church, built or hired for the purpose of the vestry-meetings. The minister of the parish—that is to say, the rector, vicar, or perpetual curate—if he be present, is entitled to be the chairman; but if he be not present, then the meeting may nominate one of the inhabitants to be chairman. The chairman has the power of adjourning the meeting, but he must exercise such power prudently, and so as to facilitate the business. None but persons rated to the relief of the poor can vote in a vestry; and though formerly none could vote unless actually residing in the parish, this is no longer necessary, provided the person is rated to the poor of the parish. The number of votes depends on the rental or value of the occupation, one vote being allowed for each £25 of value, or rental, provided that no person shall have more than six votes. In case of joint occupiers, each votes according to his own share of the joint value. One of the incidents of holding a vestry is, that any vestryman, after a show of hands is taken, may demand a poll, and if the poll be refused, the resolution come to is void. The law has surrounded this parochial right to a poll with jealous care; and if there is not fair play given, and ample notice and time for all the inhabitants entitled to vote to come and give their vote, the whole proceedings are void. It is the duty of the churchwardens and overseers to keep a book in which to enter the minutes of the vestry. The vestry appoints annually church-wardens and highway surveyors, and nominates overseers. A church-rate can only be made by a vestry, and if the majority choose to make none, then no rate is possible. The vestry also deliberates and resolves as to stopping up, diverting, or turning highways; whether the owners of small tenements ought to be excused from paying poor-rates; whether baths and wash-houses, parish libraries, etc., shall be adopted. In large parishes, a vestry clerk is usually appointed, and paid out of the poor rate; and in such case he is appointed by the vestry. His duty is to give notices of all vestry meetings; to summon the church-wardens and overseers; to keep the minutes, accounts, and vestry-books; to make out the church rate; recover arrears of rates; make out lists of persons qualified to act as jurymen, and to give notices for claims to vote for members of parliament. Some parishes are governed by a select vestry, which means a small part of the chief inhabitants appointed by justices of the peace under a statute, and their duty consists of relieving the poor, and they supersede the common vestry of the parish.

VESU'VIAN, or IDOCRASE, a mineral, allied to garnet, and sometimes called *Pyramidal Garnet.* It is found in volcanic and in primitive rocks. It is frequent in masses ejected from Vesuvius, whence its name. The hardness is about equal to that of quartz. The colours are various—yellow, green, brown, almost black, rarely azure. V. is composed of silica, alumina, and lime, in somewhat varying but not very unequal proportions, with a little oxide of iron and oxide of manganese. It is employed as an ornamental stone, but is not very highly valued. The green-coloured varieties are known as *Volcanic Crysolite*, and the brown as *Volcanic Hyacinth.*

VESU'VIUS, a well-known volcano, is situated near the east shore of the Bay of Naples, about ten miles from the city of that name. It is a solitary mountain, rising majestically from the plain of Campania, having at the base a circumference of about 30 miles, and dividing, at a certain height, into two summits, Somma and Vesuvius Proper. The height of the mountain and form of its apex are subject to frequent changes by eruptions. It is estimated to be at present nearly 4000 feet high

In the single eruption of 1822, it lost 800 feet, nearly all of which has been restored by subsequent eruptions. Before that event, the summit was a rough and rocky plain, covered with blocks of lava and scoriæ, and rent by numerous fissures, from which clouds of smoke were given out. But it was then altered to a vast elliptical chasm, three miles in circumference, three-quarters of a mile at the greatest diameter, and about 2000 feet deep.

The first recorded eruption took place in the year 79 A.D. Warnings had been given 16 years before by a great earthquake, which shattered the cities of Herculaneum and Pompeii, and the earth was frequently shaken by slight shocks until August of the year 79, when they became more numerous and violent. Previous to this, V. was not suspected to be a volcano. Its sides were covered with famous vines, and its ancient crater, partly filled with water, formed the stronghold of the rebel chief, Spartacus. The morning of 24th August brought comparative repose; but in the course of the day, a huge black cloud rose from the mountain, from which stones, ashes, and pumice were poured down on all the region around. The elder Pliny, who commanded the Roman fleet at Misenum, sailed to the help of the distracted inhabitants: he landed near the base of the mountain, was enveloped in sulphurous vapour, and was suffocated. The younger Pliny gives a graphic account of the eruption in two letters to Tacitus, which are well known. No lava was ejected on this occasion, nor indeed in any eruption in historic times up to the year 1066. Pompeii was buried under a thickness of 20 feet of loose ashes, and remained unknown till about a century ago. A torrent of mud spread over Herculaneum, which, by additions from subsequent repeated eruptions, now forms a thickness of 80 or 100 feet. Since this first famous eruption, V. has been an active volcano, and has been frequently but irregularly in eruption, about 60 great and numerous smaller ones having taken place. In 472, the eruption was so great that the ashes fell even at Constantinople, and caused great alarm there. The summit known as Monte Nuovo was, in 1538, forced up in two days to the height of 413 feet, and with a circumference of 8000 feet. In 1631, the villages at the foot of the mountain were covered with lava, and torrents of boiling water were sent forth. Since that described by Pliny, the most famous is the eruption of 1779, of which Sir William Hamilton, then British minister at Naples, gives a long and interesting account. In the spring of that year, it began to pour forth lava; this was succeeded by rumbling noises and puffs of smoke; then jets of red-hot stones and ashes made their appearance, and increased in number and intensity, until the eruption arrived at its climax between the 5th and 10th of August. Then enormous volumes of white clouds rose from the crater to a height four times that of the mountain, and lava poured from the crater in torrents down the sides of the cone. This was followed by columns of fire, which rose on some occasions to three times the height of V., or more than two miles. In the midst of all this, showers of stones, scoriæ, and ashes were thrown out to a great height. One mass of rock ejected was 108 feet in circumference, and 17 feet high. A more terrible eruption took place 15 years later, by which the greater part of the town of Torre del Greco was destroyed. The violent eruption of 1822 has already been alluded to. One of the most remarkable of the recent eruptions was that of May 1855, when vast floods of lava poured down the sides of the mountain, spreading desolation in every direction, and destroying the village of Cercolo. Before its close, 11 cones were in active operation, the discharge from which was so great that at one time a total falling-in of the mountain was dreaded.

Foro Civile at Pompeii, with Vesuvius in the distance.
(From a Photograph.)

VE'SZPRIM (Ger. *Weiszbrunn*), a town in the west of Hungary, beautifully situated among vineyards to the north of Lake Balaton, and 70 miles south-west of Pesth. It is a bishop's see, and contains a handsome episcopal palace, a fine cathedral, a Piarist college, gymnasium, and an institution for decayed or disabled priests. Cloth and flannel weaving, silk-spinning, the cultivation of wine, fruits, and tobacco, are the principal industries; but coal-mining, iron-works, large cattle-markets, and general trade, are carried on. The town has been on several occasions in the possession of the Turks; and an interesting memorial of them is a slender minaret, which rises from an old Gothic tower, and which now serves as a watch-tower against fire. Pop. 11,300.

VETCH (*Vicia*), a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, having a tuft of hairs on the style beneath the stigma, nine stamens united, and one free. To this genus the *Bean* (q. v.) is generally referred. The species, however, are mostly climbing plants, annuals, with pinnate leaves ending in tendrils, and with no terminal leaflet. A number of species are natives of Britain. The common V. (*V. sativa*), sometimes called by agriculturists TARE, frequent in cultivated ground in Britain and throughout Europe, and itself much cultivated as green food for cattle, has rather

large purple, blue, or red flowers in pairs, axillary and almost sessile. In cultivation, it varies considerably both in size and other particulars, as in the breadth of the leaflets, the number of them in a leaf, &c. Oats are generally sown along with it, to afford it a little support, and thus prevent its rotting in wet weather.—*V. Cracca* and *V. sepium* are very common British species, the former with many-flowered stalks, bearing beautiful bluish-purple flowers, a chief ornament of hedges and bushy places in the latter part of summer. These

Vetches.

and other species, natives of Britain or of different parts of Europe and the north of Asia, have been either occasionally cultivated as food for cattle or recommended for cultivation, and generally agree with the Common V. both in their qualities and in the mode of cultivation which they require. *V. biennis* and *V. Narbonnensis* are amongst those chiefly cultivated in some parts of Europe. The species of V. are very numerous, chiefly in the temperate parts of the northern hemisphere.

VETCH, BITTER. See OROBUS.

VETCHLING. See LATHYRUS.

VETERAN CORPS are among the Military Reserves of all nations. They consist of old soldiers past the prime of active manhood, and incapable of taking the field. Their discipline and steadiness, however, admirably fit them for garrisons or fortresses, and for the instruction of young troops. The Veteran Battalions did good service during the French war as home guards, releasing the active troops for foreign service. The British veteran troops consist of about 12,000 Enrolled Pensioners (see PENSIONS). But from the short periods during which men serve as soldiers, and the number of officers who sell out on reaching the rank of captain, it is almost certain that very large veteran corps could be formed from civil life in any case of national emergency.

VETERINARY MEDICINE (Lat. *veterina*, beasts of burden; probably for *vehiterina*, from *veho*, to carry) embraces the medical management of the domestic animals, and appears to have been studied by the ancient Egyptains as well as by the Greeks and Romans. Hippocrates contributed a treatise on equine disorders; Columella and Vegetius (the latter of whom flourished about 300 A. D.) have left several curious veterinary works. Until after the middle of the 18th c., there were, however, no schools for the teaching of veterinary science or art. The several works published in France, Italy, and elsewhere were not of great value. In Great Britain, Blundville and Gervase Markam, who lived in the reign of Elizabeth, published volumes on farriery; Snape, farrier to Charles II., produced an anatomical treatise on the horse; Mr Gibson, previously a surgeon in a cavalry regiment, paid much attention to the disorders of animals, and about the middle of last century, published *The Farrier's Guide*, which continued for many years the best authority on the subject. The treatment of sick horses remained, however, in the hands of the riding-master, the groom, or the shoeing-smith or farrier (from *ferrum*, iron); whilst the doctoring of the other domestic animals devolved upon the goatherd, shepherd, or cowleech.

Veterinary medicine, as a scientific art, takes date from 1761, when the first veterinary college was established at Lyon with royal patronage, under the able teaching of Bourgelât. Five years later, the flourishing school of Alfort, near Paris, was founded. In February 1791, the London College was organised, Charles Vial de St Bel being appointed principal, with Delabere Blaine as assistant-professor. St Bel died in 1793, and was succeeded by Mr Coleman, who, during many years, zealously improved the position and teaching of the college. In Scotland, lectures on veterinary medicine were first given by Mr Dick in 1819. Under the auspices of the Highland and Agricultural Society, and Senatus Academicus, Mr Dick, in 1823, began his systematic teaching of veterinary surgery. Soon afterwards, he erected the college buildings in Clyde Street, Edinburgh, with hospital for sick animals; he collected a valuable museum; extended the curriculum of study; and engaged efficient assistants, among whom were John Barlow and Dr George Wilson, to instruct his pupils in anatomy and physiology, chemistry and materia medica, cattle-practice and histology. At his death in April 1866, Mr Dick bequeathed to the city of Edinburgh the college which he had founded, and his entire fortune, to be devoted to the teaching and improvement of veterinary medicine. For many years, upwards of 80 professional pupils, with a number of agricultural and amateur students, have annually attended the classes at the Edinburgh Veterinary College. About the same numbers are enrolled at the Camden Town College, London. A new school, presided over by Mr John Gamgee, was established in 1865 at Bayswater, London. Since 1861, a veterinary school has been conducted in Glasgow by Mr James Macall. An attendance at one or other of these colleges, during two sessions of five months each, is required before a pupil can present himself to be examined for his degree. The fees for the whole curriculum range at the different educational establishments from £16 to £26, 5*s*. At the Camden Town College, London, a preliminary examination is now very properly required before a pupil can be enrolled, and such an examination must be rendered imperative at all the teaching colleges. As the subjects taught have multiplied and extended, the period of time spent at college must likewise be extended: regular attendance throughout three winter sessions, and one or two shorter summer courses, should be required, before a student becomes eligible for examination. At the best continental schools, three years' study is generally required before a student can obtain his license to practise, and the period is not too long for the acquirement of the scientific and practical knowledge which an educated and competent veterinarian ought to possess. During a longer residence at college, the pupils will have more careful and systematic clinical training in the boxes and hovels of the sick animals; and fuller instruction must likewise be provided in the diseases of cattle, sheep, and pigs.

In 1844, a royal charter was granted, under which veterinary surgeons became a corporate body, with authority to appoint examining boards, and grant diplomas or licenses to practise. According to the Register, 1000 persons now hold these diplomas, which cost £7, 7*s.*, and constitute the holder a member of the Royal College of Veterinary Surgeons. For nearly 40 years, the Highland and Agricultural Society of Scotland have annually appointed an examining board, consisting of medical men and skilled veterinarians; and at the cost of £2, 2*s.*, have granted to pupils who have studied for two sessions at the Edinburgh Veterinary College, a certificate, which has been fully recognised as a guarantee of professional ability by the public throughout her Majesty's dominions, as well as by the authorities at the Horse Guards and at the India Office. The Highland Society's certificate will probably be shortly superseded by the diploma of a College of Veterinary Surgeons for Scotland, empowered by royal charter to grant licenses to practise, and to regulate and extend the teaching at the several Scottish educational establishments. With the annually increasing numbers and value of every description of live-stock throughout our own and other countries, the veterinary profession must continue to rise, and draw towards it men of liberal education. With steadiness and ability, veterinarians frequently realise as much as their medical brethren. In many English towns and districts, there are practices worth from £600 to £1000 a year; whilst in London, Manchester, and elsewhere, the receipts of a few exceed that amount.

The literature of veterinary medicine is still meagre. Mr Percivall and Messrs Gamgee and Law have published text-books on anatomy. The chief reliable authorities on diseases consist of Mr Dick's excellent little manual of veterinary science; Percivall's *Hippopathology*, in 3 vols.; Blaine's *Veterinary Art;* Youatt's volumes on the *Horse, Cattle, Sheep*, and *Pigs;* Mr Gamgee's *Domestic Animals in Health and Disease;* Blaine, Youatt, and Stonehenge on *Dogs;* F. Dun's *Veterinary Medicines, their Actions and Uses; with an Appendix on Diseases of Animals.* The *Veterinarian*, a monthly periodical, has been published for many years, and is now well conducted by the professors of the London College. The *Edinburgh Veterinary Review*, started by Mr Gamgee in 1858, was continued first as a quarterly, and subsequently as a monthly, magazine until 1864.

VETERINARY SURGEON (Army), an officer of a cavalry regiment, or in the artillery, who is charged with the supervision of the horses, and with their cure, if in need of medical aid. A veterinary surgeon is required to produce proper testimonials of qualification, and to pass an examination. By United States regulations one veterinary surgeon at $75 per month is allowed to each of the six old cavalry regiments; but two are attached to each of the four new regiments, one at $100, and one at $175.

VE′TIVER, or CUSCUS, the dried roots of an East Indian grass (*Andropogon muricatus*), which has a very agreeable and persistent odour, something like sandal-wood. It is much prized in India and other parts of the world, and is used to perfume linen, &c. Baskets, fans, and mats are made of it in India; it is remarkable for giving out its perfume for many years, and it is strongest when moistened.

VE′TO, in Politics, the power which one branch of the legislature of a country may have to negative the resolutions of another branch. In the United Kingdom, the power of the crown in the act of legislation is confined to a veto—a right of rejecting, and not resolving. The crown cannot of itself make any alterations in the existing law, but may refuse to sanction alterations suggested and consented to by the two Houses of Parliament. The necessity for such refusal is generally obviated by an observance of the constitutional principle, that the will of the sovereign is that of the responsible ministers of the crown, who only continue in office so long as they have the confidence of parliament. The royal veto is reserved for extreme emergencies; the last instance in which it was exercised was in 1707, when Queen Anne refused her assent to a bill relating to the militia in Scotland. The House of Lords will generally support the prerogative of the crown by rejecting a measure repugnant to the sovereign; and a knowledge of this may enable the ministry to defeat it in the House of Commons—a result which the constitutional influence of the crown and the House of Lords in the Lower House may assist in producing, so as to avoid a collision between the branches of the legislature. In bills of supply, the power of the House of Lords amounts merely to a veto, as does that of the House of Commons in bills affecting the peerage.

In the United States of America, the President has a qualified right to veto all laws passed by Congress; but after that veto has been exercised, the bill which he has rejected may become law by being passed by two-thirds of each House of Congress.

In the French constitution of 1791, it was resolved to have but a single house of legislature, on the principle that it was inconsistent with the idea of a legislature representing the national will that one part of it should have a veto on another, and the same view was adopted by the Convention of 1793. But the arbitrary and violent measures of that latter body induced a strong general conviction that a division of the legislative power, and a veto in some form, was essential to give stability to the government, and moderation to faction; and in the constitution of 1795, a Council of Ancients was introduced, with a power to veto the resolutions of the legislative body.

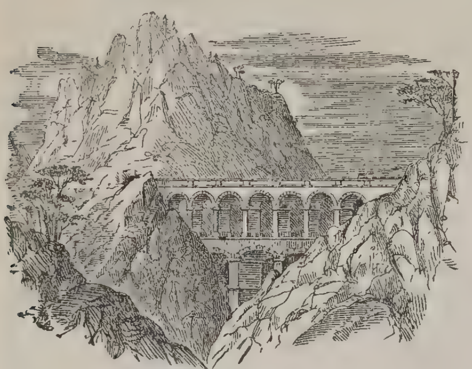
VETO ACT, in Scottish Ecclesiastical Law. See Patronage; Scotland, Church of.

VEUILLOT, Louis, French journalist and author, born in 1813, at Boynes en Gatinais (Loiret). The son of a small cooper, he was sent to a school near Paris, from which he was transferred in 1826 to a lawyer's office. He chose the profession of journalism, and filled several engagements on the provincial press, in the course of which his personalities involved him in various duels. He visited Rome in 1838, previous to which, he states, he was without much faith, either religious or political. He returned to Paris, however, a zealous adherent of the papacy, and, as editor of the *Univers*, soon signalised himself as an aggressive and uncompromising champion of the church. In 1842, he accompanied Marshal Bugeaud to Africa as his secretary, and on his return was made Chief Secretary to the Ministry of the Interior. He again edited the *Univers* in 1848; but his polemical disquisitions brought upon him the censure of the Archbishop of Paris; and in 1853 the clergy of the diocese of Orleans were expressly forbidden by their bishop to read the *Univers*, and the paper, after the usual three warnings, was suppressed by the French government in 1861. It was replaced by the *Monde*, in which V. discussed religious matters in a more temperate spirit. In 1862, he published a pamphlet, under the title of *Parfum de Rome*, which was principally devoted to heaping coals of fire on the head of Cavour, and assailing the Abbé Passaglia with the

bitterest objurgations. As an illustration of V.'s style of dealing with religious adversaries, he prays that 'Heaven may accumulate on the abbé the load of the sins which he has committed, and those which he may have remitted;' that 'his robe may become a robe of fire,' and that Heaven 'may refuse him a single tear to temper its burning.' V., besides polemical pieces, wrote novels, hymns, and a collection of articles entitled *Mélanges Religieux, Historiques, et Littéraires* (1857). He died April 7, 1883.

VEVAY (Ger. *Vivis*), a small town of Switzerland, in the canton of Vaud, remarkable for the beauty of its situation, on the north shore of the Lake of Geneva, 13 miles east of Lausanne. It stands at the mouth of the gorge of the Veveyse, where it opens upon the lake, and where the scenery of the banks is exceedingly beautiful. From the elevations about the town, the fine view to the east commands the gorge of the Rhone, backed by the magnificent rampart of the Alps of Valais. In the church of St Martin (date 1438), Ludlow, one of Charles I.'s judges, and Broughton, who read to him his sentence of death, are buried. The country in the vicinity, especially that between V. and Lausanne, is much occupied by vineyards and orchards, and the wines of the vicinity have some reputation. Pop. about 8000.

VI'ADUCT, a structure for conveying a roadway across a valley or low level, being so called in distinction from an *Aqueduct* (q. v.), which is an erection of the same description for the conveyance of water over a hollow. It is in every respect similar to an extended bridge. The great extension of railways within recent years has rendered the



The Bollerswand Viaduct on the Great Sömmering Railway.

use of viaducts much more common than formerly. These are of every kind of construction—of wood, iron, stone, and brick work (see BRIDGE, TUBULAR BRIDGE, WOODEN BRIDGES, &c.). A railway embankment is also a species of viaduct; but the term is limited to those structures which are more or less open, and rest upon piers. A very peculiar example is that over the Moine, near Nantes in France. The piers are all perforated by a pointed arch, which intersects the main cylindrical arches, and forms a groined roof, similar to that of a Gothic cathedral. This viaduct consists of 15 arches, and is 348 feet in length, and is all built of fine granite.

VIA-MA'LA, a remarkable defile in the canton of Grisons, Switzerland, is a portion of the Hinterrheinthal (see RHINE) which lies between Thusis and Zillis. The sides of the cleft, which is about two miles in length, are immense walls of rock, almost parallel to each other, and so hard that the disintegrating influence of the elements appears not to have produced the slightest effect on them, each projection on one side corresponding to an indentation on the other, almost as perfectly as at the time they were separated. The walls have a maximum height of about 1600 feet, and at various parts of the defile are not more than ten yards apart at the top. Far beneath, the Hither Rhine, compressed till it appears to one above like a mere thread, rushes like an arrow through the gorge. The first part of this defile was long deemed quite inaccessible, and had received the name of the Lost Gulf (Fr. *Trou perdu;* Ger. *Verlorenes Loch*), but in the early part of this century, a magnificent road was constructed along the whole length of the defile, from 400 to 600 feet above the river, by blasting and cutting a 'notch' in the side of the rock. The road is necessarily steep and narrow, crosses from side to side of the defile by three bridges, and is protected now by a canopy of rock overhead, and again by a wooden roofing, from falling stones and trees. So narrow is the crevasse in some places, that fallen trunks and stones are often wedged in between its sides at a considerable distance above the ordinary water-level; and on the occasion of the great flood of 1834, the river, which is generally 400 feet below the second bridge, rose to within a few feet of it, and at the same time carried off the upper bridge.

VIA'NNA, a fortified city and seaport in the north of Portugal, in the province of Minho, stands at the mouth of the Lima, 40 miles north of Oporto. It is handsome and clean, with a tolerable harbour, which admits vessels of 150 tons burden; and it carries on considerable trade with Newfoundland in salt-fish. Pop. about 9000.

VIARE'GGIO, a town of Central Italy, in the province of Lucca, close to the shore of the Mediterranean, 30 miles south-east of Spezia. It is modern, stands in a delightful plain, and has wide straight streets. At the beginning of the present century, it consisted of only a few huts; but its climate, which is healthy and delightful all the year round, and its fine situation, have induced many rich families to settle here, and it is yearly increasing in extent. It is much frequented for bathing in summer. The vicinity is productive in olives, grapes, &c. Population, about 15,000.

VIA'TICUM (Lat. *viaticum*, money allowed for a journey), the word applied in the ancient as well as modern ecclesiastical terminology to the communion administered to dying persons, which, in the case of the great journey to eternity, is thus quaintly likened to the money-provision made for a journey upon earth. This special ministration of the Eucharist to the dying is very ancient (see LORD'S SUPPER); it was the one exceptional case in which, during the times of rigorous canonical penance, the penitents were admitted to the communion before the completion of the appointed cycle of penance. By the modern practice of the Roman Church, it is permitted to the sick, to whom the Eucharist is administered in the form of the viaticum, to receive it, although not having fasted (as is required in all other cases) from the midnight previous. The viaticum may be given frequently during the same sickness, at intervals anciently of ten or seven days, but by the modern practice, even daily, should it be earnestly desired by the sick person. The priest is ordered to bring the sacred elements from the church to the dying person at any hour, whether by day or by night, when he may be called on for this last service of religion.—Protestants reject the very idea of a

viaticum, and regard the administration of the Lord's Supper in that character as superstitious.

VIA'TKA, a government of the east of European Russia, bounded on the east by the governments of Perm and Orenburg, and on the south by that of Kazan. Area, 55,356 sq. m.; pop. (1867) 2,347,796. The surface consists for the most part of marshes and sandy plains, varied here and there by hills. The soil, fertile only in the southern districts, is mostly a mixture of sand and clay. In the south, agriculture is effectively carried on, wheat, rye, barley, and oats being produced in abundance, as well as flax and hemp, which supply materials for the linen manufactures. The principal rivers are the Viatka and Kama (navigable throughout the whole year), and their affluents. Owing to the number of navigable streams, and to the well-regulated land-communications, the traffic of the government is successfully carried on. Horses of a fine breed are reared, but the principal source of the wealth of V. is its timber. Iron-works, distilleries, tanneries, and glass and cotton factories, are in operation.

VIATKA, a town of Russia, capital of the government of the same name, on the river Viatka, 280 miles north-east of Nijni-Novgorod. It was founded by the inhabitants of Novgorod, and was annexed to the Muscovite dukedom in 1489. The chief branches of industry are the preparation of skins and the manufacture of tallow and wax-candles. Corn is exported annually to the amount of 300,000 roubles (£46,875). Pop. 19,624.

VIA'ZMA, a town of Great Russia, in the government of Smolensk, and 100 miles east-north-east of the town of that name, on the Viazma. It is first mentioned in 1239, and, after being owned successively by the Lithuanians and Poles, it finally became Russian in 1634. In 1812, after a bloody battle between the Russian and French armies, in which the former was victorious, V. was demolished, and there are now hardly any remains of the old town. It carries on an active trade in corn, flax, hemp-seed, tallow, &c., and is the entrepôt for goods exported to St Petersburg and Riga. V. gingerbread is exported to all parts of the empire. Pop. 10,853.

VIBI'CES. This term is applied, in Medicine, to patches on the skin, varying in tint from bright red to violet, which occur in certain diseased conditions of the blood, and especially in purpura. They are caused by minute hæmorrhages of the capillaries of the true skin. The word is a Latin one, being the nominative plural of *vibex, -icis*, the mark of a stripe.

VI'BORG, the oldest city in North Jutland, and one of the oldest in Denmark, on a small lake, 25 miles west of Randers. Its cathedral, originally founded in the 12th c., was rebuilt in 1726. V., at which all the great highways of the interior converge, is important as a military post. Pop. 4579, engaged in the manufacture of woollen fabrics, leather, and tobacco.

VIBRIO'NIDÆ, a family of Infusoria, having an elongated or worm-like form, of which the Ear-cockle (q. v.) is an example. They derive their name from their darting and quivering motion. Some of them, as the ear-cockle, are found in living plants, others in corrupting organic matter, as the *eels* of paste and vinegar.

VIBU'RNUM, a genus of plants of the natural order *Caprifoliaceæ*, having a 5-toothed calyx, a 5-lobed, wheel-shaped, bell-shaped, or tubular corolla, 5 stamens, 3 sessile stigmas, and a one-seeded berry. The species are shrubs with simple leaves, natives chiefly of the northern parts of the world. *V. opulus* is the Guelder Rose (q. v.), or Snowball Tree, and *V. Laurustinus* is the Laurustinus (q. v.), both well-known ornamental shrubs. *V. Lantana*, sometimes called the WAYFARING TREE, is a native of the warmer temperate parts of Europe and Asia, not unfrequent in England, and often planted as an ornamental shrub. It is a large shrub or low tree, with large elliptic serrated leaves, downy, with star-like hairs on the under side. The young shoots are very downy. The flowers are small and white, in large dense cymes; the berries purplish black, mealy, and mucilaginous, with a peculiar sweetish taste, disagreeable to many, but relished by some. They are useful in diarrhœa and catarrh. Bird-lime is made from the roots in the south of Europe. The inner bark is very acrid, and was formerly used as a vesicant. The wood is white and hard, and is prized by turners. Tubes for tobacco-pipes are made of the young shoots.—A North American species, *V. opulus*, or *Cranberry tree*, nearly allied to the Guelder Rose, produced berries of an agreeable acid taste, which are used like cranberries.

VICAR (Lat. *vicarius*, from *vicem*, i. e., *gerens*, acting in the place of another), the title given to the substitute, whether temporary or permanent, employed to act in the place of certain ecclesiastical officials, whether individuals or corporations; as of the pope, a bishop, a chapter, a parish priest, &c. Vicars take different names from these various considerations. Vicars of the pope are called 'vicars-apostolic,' and they are generally invested with episcopal authority, in some place where there is no canonical bishop. Vicars of a bishop are either 'vicars-general,' who have the full authority of the bishop all over his diocese, or 'vicars-forane' (Lat. *foraneus*, from *foris*, abroad), whose authority is confined to a particular district, and generally otherwise limited. A vicar-capitular is the person elected by the chapter of a diocese, during the vacancy of the see, to hold the place of the bishop, and to exercise all the authority necessary for the government of the diocese. The vicar-capitular, however, is not competent to do any act of episcopal order, as ordination, confirmation, &c. His power is restricted in other ways which it would be out of place to detail here. Parochial vicars are either perpetual, as in parishes, which were anciently held *in Commendam* (q. v.), or which were held by religious corporations; or temporary, whose appointment may be recalled at pleasure, or after a fixed time. The name, in this sense, is sometimes given, especially in the Roman Catholic Church, to the assistant-priest, or, as he is called in England, the curate, in a parish. The functions of 'vicars-apostolic' are described under the head IN PARTIBUS INFIDELIUM.

VICE-A'DMIRAL. See ADMIRAL and FLAG-OFFICER.

VICE-CHA'MBERLAIN. See CHAMBERLAIN, LORD.

VICE-CHA'NCELLOR, a judge in equity, appointed by the crown under letters-patent, to assist the Lord Chancellor of England. The title and functions are at least as old as the reign of Henry II.; but the office long fell into disuse, and was revived by statute 53 Geo. III. c. 24, appointing one vice-chancellor. Act 5 Vict. c. 5, s. 19, afterwards appointed two more, on the abolition of the equitable jurisdiction of the Court of Exchequer. The office is ancillary to that of the Lord Chancellor for whom the vice-chancellor is empowered to act in his absence, besides being entitled to hold separate courts. The vice-chancellor and the Master of the Rolls have co-ordinate jurisdiction, in the first

instance, over all matters of equity, subject to the revision of the court of appeal. The vice-chancellors hold their office *ad vitam aut culpam*, and are not expected, like the Lord Chancellor, to resign office with the ministry.

The vice-chancellor of a university is an officer who is empowered to discharge certain duties of the chancellor, chiefly those connected with granting degrees, in his absence.

VICE-CON'SUL, a subordinate officer, to whom consular functions are delegated in some particular part of a district already under the supervision of a consul. A British vice-consul is selected by the consul under whom he is to act, and his name is transmitted for approval to the Secretary of State for Foreign Affairs. If he is approved of, the consul is directed to furnish him with authority to act, and to impart to him instructions similar to what he himself has received from the Foreign Secretary. The vice-consul acts under the general supervision of the consul, corresponding with him in ordinary cases, but in some special cases with the Foreign Office. A consul is not at liberty to dismiss a vice-consul acting within his district without the sanction of the Foreign Secretary; but if of opinion that sufficient grounds for the dismissal exist, his duty is to give information to the Foreign Secretary, suspending the vice-consul in the meantime, if the circumstances be urgent; and in all cases awaiting the decision of the Foreign Secretary, before taking ulterior steps. See CONSUL.

VICE'NNIAL PRESCRIPTION, in the Law of Scotland, is the limitation which is put to certain actions after the lapse of 20 years, such as actions by heirs to reduce an erroneous retour.

VICE'NZA, a handsome city of Italy, beautifully situated at the confluence of the rivers Bacchiglione and Retrone, 42 miles west of Venice by railway. The rivers are crossed by eight bridges, one of which, a bold single arch, is attributed to Palladio, who was a native of the city, and to whose genius it is much indebted for its beauty. V. is surrounded by a moat, and walls half in ruins, and contains many fine palaces and churches. The Piazza dei Signori, a remarkably fine square, contains a lofty and slender campanile, 270 feet high, and only 23 feet wide. The Palazzo della Ragione is a handsome Gothic building, by Palladio. The Palazzo Prefettizio, by the same architect, is a rich and fanciful Corinthian edifice. The Duomo, built in 1467, is Gothic; the nave of it is 60 feet wide; and in certain of the chapels are interesting pictures. The Teatro Olimpico, the scenery of which is fixed, and represents a species of piazza, with diverging streets of real elevation, but diminishing in size, is by Palladio. V. contains a lyceum, a seminary, and many colleges; a library, numbering 60,000 vols., and a hospital, and many benevolent institutions. Manufactures of silk, linen, earthenware, paper, and velvet are carried on. The surrounding country, studded with mansion-houses, and rich in vineyards, is exceedingly beautiful. Pop. 25,000.

V. (anc. *Vicentia*, or, more correctly, perhaps, according to inscriptions, *Vicetia*) is a very ancient city. An inscription records its existence in 136 B. C.; and it continued to be a municipal town of some consideration, till it was laid waste by Attila, 452 A. D. It revived again under the Lombards, and became for a time, in the middle ages, an independent republic.

VI'CEROY (Lat. *vice*, in place of, and Fr. *roi*, king), a title popularly given to any officer who is delegated by a sovereign to exercise regal authority in his name in a dependency, as the Lord-lieutenant of Ireland—who, however, is never officially so styled. It was the proper official designation of the governors of Naples, Spain, and Peru, under the old Spanish monarchy.

VICH, or VIQUE, a city of Spain in Catalonia, modern province of Gerona, on a hill-girt plain about 45 miles north of Barcelona. Its cathedral, built about 1040, but repaired and modernised about the end of the 18th c., is bold and elegant in the interior, and the Gothic cloisters are of the most rich and elegant description. Corn, fruit, and a bad wine are the products of the vicinity; and the inhabitants are employed in weaving, and in the manufacture of hats and paper. Pop. 12,000. V., the Roman *Ausa*, was afterwards called *Ausona* and *Vicus Ausonensis*, of the first part of which its present name is a corruption.

VICHY, a small town of the interior of France, in the dep. of Allier, stands on the Allier, in a fine valley, surrounded by hills clad with vines and fruit-trees, 35 miles south-south-east of Moulins. Pop. 5424. V. is the most fashionable bathing resort in France. The springs which rise at the foot of the volcanic mountains of Auvergne (q. v.) are of the alkaline class, and the most efficacious of the kind that are known. They vary in temperature from 68° to 112° Fah., and are used both for drinking and bathing. They are resorted to in cases of indigestion, chronic catarrh, gout, &c. See MINERAL WATERS.

The virtues of the *aquæ calidæ* of this place were known in Roman times, as is testified by the numerous remains of marble baths and coins of the times of Claudius and Nero that have been dug up; but their modern repute arose only in the present century.

VI'CIA. See VETCH and BEAN.

VI'CKSBURG, a city and port of Mississippi, U. S., on the Mississippi River, 408 miles north of New Orleans, 44½ west of Jackson, built on a collection of high bluffs. It is the chief town between Memphis and New Orleans, exporting before the war of 1861, 100,000 bales of cotton per annum. It was strongly fortified in 1861, and provided with a large garrison. In January 1862, it was attacked by the U. S. naval forces from Memphis and New Orleans, but without success. In April 1863, a naval attack was combined with the land-forces under General Grant, who defeated General Pemberton near Jackson, cut off supplies and reinforcements from the garrison, and with a close siege and continual assaults, compelled a surrender, July 4, 1863, with 30,000 prisoners of war, 200 cannon, and 70,000 stand of arms. Pop. (1880) 11,814.

VICO, GIAMBATTISTA (or GIOVANNI BATTISTA), a jurist, philosopher, and critic, was born at Naples in 1668, spent the whole of his life in that city, and died there in 1744. He was the son of a small bookseller. He was educated by the Jesuits, and afterwards studied for the bar. Weak health preventing him from following his profession, he became tutor in jurisprudence to a nephew of the Bishop of Ischia; and after filling this position for nine years, he obtained the chair of Rhetoric in the university of Naples. This office was poorly paid; but though much distinguished by persons of the highest position, V. did not succeed in getting a better one until the accession of the Bourbons in 1735, when he was appointed historiographer to the king of Naples. As he married early, and had a large family, his life was passed in great poverty, and it was, moreover, embittered by family troubles, and by constant ill-health. The great work which has made his name illustrious, the *Scienza Nuova*, first appeared in 1725; but it was completely recast in a subsequent edition, published in 1730, with the effect of making

it more imposing as a system, at the expense of a great loss of clearness. A third edition, in which the work was considerably enlarged, was published in 1745, shortly after the author's death. In the *Scienza Nuova*, V. brought together, and attempted to fuse into a system, opinions which he had previously advanced in a somewhat numerous series of separate treatises. The work was long in arriving at its proper place in European literature, which must be in a great measure attributed to its obscure and enigmatical style. Much of the obscurity arises from the use of an uncouth terminology, which the author often leaves unexplained, and (in the case of the later and authoritative editions) from the rigorous application of the deductive method to subjects which do not always admit of it. The *Scienza Nuova* was virtually unknown out of Italy in 1822, when a German translation of it appeared at Leipzig. It was, a few years later, translated into French (with some curtailment) by M. Michelet (*Principes de la Philosophie de l'Histoire, traduits de la 'Scienza Nuova' de G. B. Vico;* Paris, 1827); and the author has since that found his proper rank among the most profound, original, and ingenious of modern thinkers.

The *Scienza Nuova* (*De' Principj d'una Scienza Nuova d'interno alla Comune Natura della Nazioni*) may be described as a *Novum Organum* of politico-historical knowledge. Observing, amid the infinite variety of thoughts and actions, of language and manners which the history of nations presents, a constant recurrence of the same characteristics, in the political changes which peoples the furthest removed from each other in time and place have passed through, an essential similarity of development, V. proposed to himself the task of distinguishing amid social phenomena the regular from the accidental; of finding out the laws which govern the formation, the growth, and the decay of all societies; in fine, of tracing the outlines of the universal, the ideal history of society—the idea of which he himself believed to have existed from eternity in the mind of God. In doing this, he attempted, by means of historical criticism on the widest basis to illustrate the inter-dependence of all the sciences; to shew that the progress of each of them is related to that of all the others, and the progress of all of them dependent upon, while also acting powerfully upon the general condition of society. And while holding that the actual state of every society is the result of a free development of the human faculties, he attempted to give a historical demonstration of the existence of a Divine Providence directing the career of nations, overruling the designs which men propose to themselves; operating, however, not by positive laws, or arbitrary interferences, but by means of methods and expedients which men resort to freely. It has been not inaptly said that the *Scienza Nuova* includes a system of social (as distinguished from natural) theology—a demonstration of God's government of the world, and of the laws in which that government consists. V., in these inquiries, accepted from Descartes the individual consciousness as one of the criteria of truth; but he also employed another—the collective consciousness, or the common sense of mankind—the accord of the race, as it may be gathered from history—in a word, authority.

It would be difficult to overrate the ingenuity and originality of many of the inquiries into which V. was led by the attempt to delineate the ideal history of society; and he has rarely failed to put forward views rational and probable compared with those which were accepted among his contemporaries. With a truly admirable insight, he has not seldom hit upon the conclusions to which increased social knowledge and more scientific conceptions have conducted inquirers of later generations. Thus, in clearing the ground for the foundation of his system, he was led to precisely those views about Homer and the authorship of the Homeric poems which are popularly associated with the name of Wolf; and to anticipate the general view of the credibility of early Roman history which was elaborated by Niebuhr. (See also COMTE, the germs of many of whose speculations may be found in Vico.) The beginnings of religion, the origin of poetry and language, the commencement of society (which he ascribes to the influence of a common religious belief and worship), the foundation of the privileges of the heroic or aristocratic class, are among the earlier subjects of his speculation. He proceeds to trace the origin of jurisprudence, and to shew how its development has been dependent upon social changes; and he afterwards deduces from the history of ancient societies, and in some degree from the history of the governments which sprung out of the ruins of the Roman Empire, the laws which govern the progress, the conservation, and the decay of nations. A monarchy, with an equality of civil and political rights as between subjects, was his ideal of good government for advanced societies.

Though he ascribed to religion a paramount influence in forming and in conserving society, and though it was one of his principal objects to demonstrate the divine government of the world, V. did not escape the suspicion of having written in a spirit of hostility to religion. It was alleged that he had written so obscurely, as he often did, through the fear of incurring ecclesiastical censures. Some critics of another school charged him, with at least equal plausibility, of having striven, both in his particular doctrines and in his consecration of the principle of authority, to satisfy the Roman Catholic Church. The cavils made on either side, however, do not seem deserving of much attention; and it is pleasant to know that V., though not unconcerned about the accusations made against him, felt in his later years consoled for the many trials and disappointments of his life, by the completion of a work, the greatness of which he knew better than any of his contemporaries. In 1818, the Marquis de Villa Rosa published a collection of the whole of V.'s works. A second edition appeared in 1835.

VICTOR, CLAUDE PERRIN, Duke of Belluno, and Marshal of France, was born, 7th December 1764, at La Marche, in the dep. of Vosges, and at the age of 17 enlisted as drummer in a regiment of artillery. He received his discharge after eight years of service as a common soldier; but re-enlisted in 1792, and having fortunately attracted the attention of Napoleon by his able conduct at the siege of Toulon in 1793, was promoted, through his influence, at the close of that year. In the Italian campaigns of 1796—1797, and 1799—1800, he commanded the vanguard, and aided by the favour of Napoleon, who threw opportunities in his way, displayed great skill and extreme daring on numerous occasions. At Marengo he maintained such an obstinate resistance for eight hours to the overwhelming numbers of the enemy, that the expected reinforcements had time to arrive, and convert the imminent victory of the Austrians into a crushing defeat. In 1806, he commanded with distinction a *corps d'armée* in the Prussian and Russian campaigns, and though captured in 1807 by Schill's partisans, he was exchanged (for Blücher) in time to win, on the bloody field of Friedland, the baton of Marshal of France, and the title of Duke of Belluno. As governor of Berlin, he gained the esteem of the

Prussians by his dignity and moderation; and in 1808, he was sent to command the first corps d'armée in Spain. Here he gained several victories, notably over Blake at Espinosa, and Cuesta at Medellin; but was defeated by Wellington in the obstinate battle of Talavera (q. v.), and again by Sir Thomas Graham at Barrosa (q. v.). After a fruitless blockade of Cadiz, he was recalled to command the ninth corps d'armée in the Russian campaign of 1812; and though occasionally defeated in his many contests with the Russians, his general conduct and success were worthy of his previous high reputation. When the allies, in overwhelming numbers, were closing round France, V. appeared prominently in the fore-front of the defence, made a valiant stand at the passes of the Vosges, and retook Saint Dizier and Brienne at the point of the bayonet; but his neglecting to occupy the bridge of Montereau was a fault which Napoleon could not pass over, and he was deposed in favour of Gérard (q. v.). Notwithstanding this disgrace, he persisted in continuing with the army, and his zeal for his country suffered no diminution, as his energetic conduct at subsequent minor combats, and at the battle of Craonne, sufficiently proved. A severe wound which he received at this last battle brought his military career to a close; and had it chanced to be mortal, the character of V. would have stood out in bold relief on the page of history as an able soldier, a faithful friend and follower, and a sterling patriot. But though not mortal, in a physical sense, it brought death to his hitherto spotless reputation; for the sickening ardour of his professions of loyalty to the Bourbons, and his vile calumniations of the now fallen chief, to whom he wholly owed his rise, displayed the foulest ingratitude. V.'s servile attachment to Louis XVIII., however, gained him a peerage and other honours; but the readiness with which he accepted the presidency of the military commission appointed to try such of his old companions in arms as had deserted to Napoleon during the 'Hundred Days,' brought upon him merited obloquy. His subsequent career requires but brief notice: he was minister of war in 1821—1823; second in command in the Peninsula in 1823; and was afterwards accredited as ambassador to the court of Vienna. The Austrian court refused to receive him unless he laid aside his ducal title; and this question of etiquette attracted so much attention, and gave rise to so much vehement discussion, that the good understanding of the two countries was for a time endangered. After this event, V. took no part in public affairs, and died at Paris, March 1, 1841.

VICTOR-AMADEUS, the name of three sovereigns of the House of Savoy.—VICTOR-AMADEUS I., Duke of Savoy, succeeded his father, Charles-Emmanuel the Great, in 1630, and carried on the war with France; but in 1631, he was forced to surrender Pignerol, La Perouse, Angrone, and Luzerne to France, in exchange for Montferrat and Alba. He paid great attention to the internal improvement of his dominions, and re-established the university of Turin on an extended scale; but the irresistible pressure exercised on him by Richelieu, forced him into a war with the Spaniards in Italy; and after routing his opponents at Tornavento (1636) and Montebaldone (1637), he died at Vercelli, October 7, 1637.—VICTOR-AMADEUS II., grandson of the preceding, and one of the most able of princes, was born May 14, 1666, and succeeded his father, Charles-Emmanuel II., in June 1675. Till 1680, the administration of government was in the hands of his mother, Marie Françoise of Nemours, who, in spite of the pressure of France on one side and Austria on the other, succeeded in preserving a neutral attitude in the quarrels between her two powerful neighbours. In 1684, V. married Anne-Marie of Orleans, the niece of Louis XIV.; but the overbearing insolence of the 'Grand Monarque,' who forced him to persecute the Waldenses (q. v.), and arrogantly ordered him to contribute an auxiliary force to the French army, and give up the citadel of Turin, roused the ire of the high-spirited young duke, speedily put an end to the good understanding which would naturally have accompanied their intimate relationship, and drove him into a league with Austria and Spain against France. In revenge, a French army under Catinat assailed V.'s dominions, and though he was reinforced by 4000 Austrians under his relative, Prince Eugene, the allies were completely routed at Staffarda (August 1690), and the victorious Catinat had completed the reduction of Savoy and Nice before the winter of 1691. The duke, aided by considerable reinforcements from Austria and Spain, gallantly maintained the contest; but a second and much more disastrous defeat at Marsaglia (October 4, 1693), where he left 10,000 dead on the field, put almost the whole of Piedmont at the mercy of the French. The war, however, continued; the duke's obstinacy and almost romantic daring balancing Catinat's high military genius; till in the autumn of 1696, a treaty much more favourable to Savoy than to France, detached the former from the grand alliance. When the quarrel respecting the Spanish Succession (q. v.) broke out, V. took part with France—an alliance cemented by the marriage of his second daughter, Louisa Gabriele, to Philip of Anjou, the new monarch of Spain, as well as by the previous (1697) marriage of his eldest daughter (the mother of Louis XV.) to Louis, Duke of Burgundy, Louis XIV.'s grandson—and was appointed commander-in-chief of the combined armies of France and Spain; but though he was aided by the counsels of his old opponent Catinat, the Austrians, under his former ally, Prince Eugene, defeated him at Chiari (November 1701), and drove him behind the Oglio. Two years afterwards, the successes of Vendome in Italy and Villars in Germany, by bringing more prominently before his imagination the possibility of having the Bourbons for his neighbours on the east as well as on the west, along with the tempting offers of Austria and Britain, induced him to abandon France, and join the alliance against her. In revenge for what they called the duke's treachery, the French under Vendome overran and devastated Piedmont; but with the recall of their chief, fortune deserted the French, and they were totally routed by the duke and Prince Eugene under the walls of Turin, 7th September 1706. The duke, who had some years before retired from this contest, was rewarded by the treaty of Utrecht (1713) with the rest of Montferrat, Val-Sesia, Lomellino, and the island of Sicily, with the title of king; besides being acknowledged as heir to the Spanish throne, in case of the failure of the Bourbon dynasty. In 1720, he was made to surrender Sicily to the emperor in exchange for Sardinia. The latter portion of V.'s long reign was wholly free from foreign strife; and his restless energy was employed in improving the system of administration, thoroughly assimilating the new continental acquisitions, in replenishing the treasury, which, in spite of the British subsidy, had been drained by the long contest with France, and in encouraging agriculture and industry, especially the cultivation of mulberry trees and tending of silk-worms. Reforms and improvements were effected in the university of Turin, and several colleges founded. On September 2, 1730, the king abdicated; but attempting, in the following year, to resume the regal dignity and functions, he was arrested and

imprisoned. He died at the château of Moncalieri, near Turin, 31st October 1732.—VICTOR-AMADEUS III., grandson of the preceding, succeeded his father Charles-Emmanuel III. in 1773. His reign was full of misfortune and disaster, and was brought to a close by his death in 1796, after the compulsory cession of Savoy and Nice to the French Republic.

VICTOR-EMMANUEL I. (Ital. *Vittore-Emmanuele*), king of Sardinia, the second son of Victor-Amadeus III., was born 24th July 1759, and till his accession, bore the title of Duke of Aosta. He was one of the most determined adversaries of the French Revolution; and on the outbreak of war in 1792, he was chosen to command the Sardinian army, repulsed the French at Gillette, and forced his way to the mouth of the Var, but was ultimately compelled to seek shelter among the Alps. He opposed himself strongly to the conclusion of peace with France in 1796; and from this time lived in Southern Italy, and afterwards at Cagliari, whence he did not return to Turin till 1814. He had assumed the royal title on his elder brother's abdication in 1802; and the treaty of Paris restored to him Piedmont, Nice, and the half of Savoy in 1814; the treaty of 1815 added the remainder of Savoy, while the Congress of Vienna presented him with the duchy of Genoa—so that the little kingdom had profited territorially by its troubles. But the loyal delight of the Savoyards and Piedmontese at the return of their legitimate ruler was speedily quenched by the first acts of his administration. The French institutions to which they had been long enough accustomed to feel their immense superiority over the system they had supplanted, were abolished, and the old absolutism gradually restored. This change, which was no doubt to a certain extent effected by way of destroying all trace of French domination, by depriving the people of various important privileges and amenities, restoring old and hated abuses, and increasing taxation, excited wide discontent, which was heightened by the odious religious persecutions of the Vaudois and the Jews; secret societies were formed, and on March 10, 1821, a revolution broke out. The army proclaimed the constitution promulgated by the Spanish Cortes in 1812; and the king, rather than take the oath to it, resigned in favour of his brother, Charles Felix, March 23, 1821. He died at Moncalieri, near Turin, January 10, 1824.

VICTOR-EMMANUEL II., late king of Italy, the son of Charles-Albert (q. v.), king of Sardinia, was born March 14, 1820. He was a pupil of the Jesuits; but nevertheless, under his father's superintendence, received an excellent education; and, being heir to the throne, he commanded, in accordance with an old custom of his House, the brigade of Savoy in the campaign of 1848—1849, and displayed great gallantry at Goito and Novara. On the evening of the latter battle, his father, seeing the hopelessness of the struggle, and unwilling to bow to the onerous conditions offered by Radetsky, abdicated in favour of V., who, being the husband of the Archduchess Adelaide (the cousin of the Austrian emperor), and uncommitted to the views of the Italian Ultra-democrats, might hope to obtain more favourable terms from the victor. V. thus ascended the throne of Sardinia, 23d March 1849, and restrained effectually, for a time, the enthusiasm of the more ardent among the national party, though, on the other hand, he maintained, with the utmost fidelity, the provisions of the liberal constitution granted by his father. He made a happy choice of ministers in such men as Cavour, D'Azeglio, &c., whose policy it was to increase the strength and importance of the country by improved administration, rigid economy in the finances, care of the army, and encouragement to trade by the conclusion of commercial treaties with foreign nations. They saw too clearly that, despite the intense and almost unanimous desire for unity throughout Italy, a contest single-handed with Austria was utterly hopeless, and preferred, till a more convenient season, to seem to renounce all idea of any such project. The property of the state was sold, and various measures calculated to greatly diminish the privileges, and restrict within moderate limits the inordinate influence of the clergy, adopted—changes which brought upon the king the thunders of the Vatican; but V., nothing daunted, protested by a vigorous 'memorandum,' and more obstinately asserted and maintained his independence of the papacy. The revolt at Genoa was sternly suppressed; but the king and his ministers were, in secret, by no means displeased to see that the feeling of nationality was still vigorous; for, following the traditional policy of the House of Savoy, he was only biding his time to 'descend with the valley of the Po,' and swallow 'another leaf of the artichoke.' With the view of improving his position in Europe, and gaining a place at its council-board, he sent an army of 17,000 men, under La Marmora, to take part in the Crimean war on the side of Turkey; and visited (1855) in person the courts of Paris and London, being received by French and English with great enthusiasm. After the peace of Paris (1856), he entered into a closer alliance with France, gave his elder daughter Clotilde in marriage (30th January 1859) to Prince Napoleon, and backed by the French arms, provoked a war with Austria. The campaign was brief but decisive—the Austrians were routed in every battle, and the Italians were hailing with exultation the near approach to fulfilment of their long-cherished dreams of unity, when the suddenly concluded peace between France and Austria at Villa-Franca dashed their hopes to the ground. The Milanese (minus the fortresses of Mantua and Peschiera) only was added to the Sardinian monarchy, and for this the king ceded Nice and Savoy (the cradle of his race) to France as the price of its alliance. But the people of Central Italy refused indignantly the offer of Prince Napoleon as their sovereign; and Tuscany, Modena, Parma, and the Romagna, renouncing their allegiance to their respective sovereigns, voted for annexation to Sardinia, and were formally adopted by V. as his subjects. This was a greater advance towards the unification of Italy than the French emperor wished, and accordingly, V., who was still dependent on his ally for safety, though secretly favourable to the project of the 'Italian Liberator,' disavowed all knowledge of Garibaldi's expedition to Sicily, forbade him, after the island was conquered, to pass over to the continent; though he subsequently, with the consent of Napoleon III., who was desirous of preserving Rome to the pope, sent an army to aid him in conquering Naples, and formally accepted the sovereignty of the Two Sicilies. But in 1862, Garibaldi, thinking that the conquest of Rome in the same way would be equally acceptable to his sovereign, returned to Sicily, raised an army of volunteers, and was rapidly advancing on the ancient capital, when V., forced by France, put an end to the expedition by capturing Garibaldi and his army at Aspromonte. Though proclaimed by the Senate and House of Deputies *King of Italy* in February 1861, V. prudently postponed all attempts to annex Rome and Venice; and directed his attention to the internal affairs of his kingdom, which was much distracted by the intrigues of the sovereigns whom he had supplanted

At length, in the quarrel between Prussia and Austria for supremacy in Germany, appeared his opportunity; and an offensive and defensive alliance with the former of these powers was followed by the invasion of Venetia, which was ultimately surrendered by Austria. The evacuation of Rome within two years by the French was stipulated by a convention between France and Italy, and the small remnant of the 'patrimony of St. Peter' (see PAPAL STATES) which remained to the Pope was taken possession of by an Italian army after the withdrawal of the French garrison, and annexed to the dominion of Victor Emmanuel, Oct. 9, 1870. On Dec. 31, 1870, he entered Rome in triumph, and thenceforth ruled over united Italy with honour to himself and satisfaction to his subjects until his death, which occurred Jan. 9, 1878. He was succeeded by his son, Prince Humbert.

VICTORIA I., Queen of the United Kingdom of Great Britain and Ireland, daughter and only child of Edward, Duke of Kent, 4th son of George III., was born at Kensington Palace, May 24, 1819. Her mother, Victoria Mary Louisa, was 4th daughter of Francis, reigning Duke of Saxe-Coburg-Saalfeld, and sister of Leopold, king of the Belgians. Her first husband, the Prince of Leiningen, died in 1814; and on the 11th July 1818, she married, at Kew, the Duke of Kent. The duke died January 23, 1820, leaving his widow in charge of an infant daughter only eight months old, who had been baptised with the names of Alexandrina Victoria. The Duchess of Kent fulfilled the important duties which devolved upon her with more than maternal solicitude, and with admirable care and prudence. The infant princess, as she grew up, was taught to seek health by exercise and temperance, to acquire fearlessness even from her amusements, such as riding and sailing, and to practise a wise economy united to a discriminating charity. After a few years, the Duchess of Northumberland was associated with her mother in her nurture and education. The Princess V. became accomplished in music, drawing, and the continental languages; and acquired a knowledge of some of the sciences, particularly botany. Her father having belonged to the Whigs, her political education was naturally derived from the members of that party; and to Viscount Melbourne (q. v.) belongs the credit of having thoroughly instructed her in the principles of the British constitution. She ascended the throne of the United Kingdom on the demise of her uncle, William IV. (q. v.), June 20, 1837; her uncle, the Duke of Cumberland, becoming king of Hanover, in virtue of the law which excludes females from that throne. By this event, the connection which had lasted for 123 years between the crowns of England and Hanover was terminated. Victoria was proclaimed June 21, 1837, and crowned at Westminster, June 28, 1838. She found on her accession Viscount Melbourne at the head of the government; and during his premiership, and with the cordial assent of her subjects, the young queen was married at St James's Palace (February 10, 1840) to Prince Albert (q. v.), Prince of Saxe-Coburg and Gotha, and second son of the then reigning duke. Her Majesty has had issue — four sons and five daughters: the Princess Royal, Victoria, born November 21, 1840, who was married, January 25, 1858, to Frederick William, now Crown Prince of Prussia, and heir-apparent to the throne of Prussia and Germany; Albert Edward, Prince of Wales, heir-apparent to the throne of the United Kingdom, born November 9, 1841, married, March 10, 1863, Princess Alexandra of Denmark, eldest daughter of Christian IX., king of Denmark; Princess Alice, born April 25, 1843, married, July 1, 1862, Prince Frederick William Louis of Hesse; Prince Alfred, born August 6, 1844, created Duke of Edinburgh 1866; Princess Helena, born May 25, 1846, married, July 5, 1866, to Prince Christian of Slesvig-Holstein-Sonderburg-Augustenburg; Princess Louisa, born March 18, 1848, married, March 21, 1871, to the Marquis of Lorne; Prince Arthur, born May 1, 1850; Prince Leopold, born April 7, 1853; Princess Beatrice, born April 14, 1857.

It will suffice here to refer to a few of the more memorable events of this eventful reign. The changes of administration may be traced in the articles GREAT BRITAIN, MELBOURNE, PEEL, RUSSELL, DERBY, ABERDEEN, PALMERSTON, GLADSTONE, DISRAELI. The legislative measures of greatest importance were the establishment (1840) of the penny-postage (see POST-OFFICE); the Amendment of the Poor Laws (q. v.) in Scotland (1845) and Ireland (1847); the Abolition (1846) of the Corn Laws (q. v.), and (1849) of the Navigation Laws (q. v.); the Irish Encumbered Estates Act (see TITLE, &c.); the transfer (1858) of the Indian possessions from the East India Company to the crown (see INDIA); the admission (1858) of Jews into the House of Commons; the Reform Act of 1867; the Disestablishment of the Irish Church (1869); the Irish Land Act (1870); the Abolition of Purchase in the Army (1871); the Elementary Education Act for England (1870), and the Scotch Education Act (1872). Other events which will signalise this period of British history were the formation of the Free Church (q. v.) of Scotland (1843); the discovery of the North-west Passage (q. v.) by Sir Robert M'Clure (1850); the Exhibitions (q. v.) of 1851 and 1862; the discovery of gold in Australia (q. v.) and in British Columbia; the war (1854—1856) with Russia (q. v.) in defence of Turkey (q. v.), in which the siege of Sebastopol and the sufferings of the British army form the most prominent episodes; the Indian Mutiny, in 1857 (see INDIA); the Volunteer (q. v.) movement (1859), and the establishment (1866) of telegraphic communication with America (see TELEGRAPH); the Abyssinian war, 1867 (see THEODORE, in SUPPLEMENT); the formation of the Dominion of Canada, 1867 (see CANADA), and the Ashantee war, 1873—1874. The same period has witnessed the most signal commotions and changes among surrounding nations; 1848 was a year of European revolutions, during which the throne of Queen Victoria remained unshaken, the only disturbance being an abortive Chartist demonstration (see CHARTISM). The constitutional monarchy of France (q. v.) fell, and was succeeded by a republic, which soon gave place (1852) to the second Empire under Louis Napoleon (q. v.), and which fell in 1870. The great civil war in the United States of America (q. v.) has resulted in the extinction of slavery; the formation of the kingdom of Italy (q. v.) has been completed by the acquisition of Rome (see VENICE and ROME); the brief war of 1866 between Prussia and Austria has led to the unification of Germany, and the formation of a northern confederation, under the leadership of Prussia; and the Prusso-Gallic war in 1870—1871 has been followed by the re-establishment of a German empire.

The all but universal loyalty and devotion of her subjects have not prevented attempts on her life. In 1842, John Francis fired a pistol at her Majesty, who happily escaped unhurt; he was sentenced to death, but her Majesty commuted his punishment to transportation for life. In the same year, one Bean presented a pistol at the Queen, but a bystander struck down his arm. Bean was sentenced to 18 months' imprisonment, and an act was passed inflicting the punishment of whipping for such attempts. In 1852, Lieutenant Pate struck her Majesty with a cane.

'In Queen Victoria,' according to Macaulay, 'her subjects have found a wiser, gentler, happier Elizabeth.' No former monarch has so thoroughly com

prehended the great truth, that the powers of the crown are held in trust for the people, and are the means, and not the end, of government. This enlightened policy has entitled her to the glorious distinction of having been the most constitutional monarch Great Britain has ever seen. Not less important and beneficial has been the example set by her Majesty and her late Consort in the practice of every domestic virtue. Their stainless lives, their unobtrusive piety, and their endeavour to educate the royal children so as to be a pattern to every other family in the kingdom, have borne rich fruit in the stability of the throne, and have obtained for the royal family of England the respect of the civilised world.

The progress made by the nation in the various elements of civilisation, especially in that of material prosperity, has been almost unparalleled (see GREAT BRITAIN), and perhaps under monarchical institutions no greater measure of political contentment is possible than has blessed both sovereign and people during her unusually long and auspicious reign

VICTO'RIA, although one of the youngest, and, in point of area, the smallest, of the colonies of the Australasian group, is already the most important. In extent of commerce, indeed, it takes precedence of the other British colonies—India alone excepted. The extreme modernness, so to say, of the Australian colonial picture is one of its most striking features, for it belongs emphatically to the present generation. Men who might still be called young may recollect when the Port Phillip Settlement—the name first given to V.—had no existence; and those are not yet very old who may remember when even the geographical outline of Australia was incomplete, and when the great harbour of Port Phillip, now a busy scene of world-wide commerce, was undiscovered and unheard of.

Geographical Position and Extent.—V. comprises the south-east corner of Australia, at that part where its territory projects furthest into cool southern latitudes. Wilson's Promontory, to the south-east, the most southerly headland, just passes the 39th degree of S. lat.; while the most northern point, which is at the opposite or north-west extreme, is in S. lat. 34°. The long. comprises 9°—between 141° and 150° E. of Greenwich. To the W. is the colony of South Australia, separated by the 141st degree of E. long.; to the N. is New South Wales, separated by the line of the Murray River eastwards from 141° E. long. to its source, and thence by a straight line south-east to Cape Howe; and from Cape Howe to South Australia, again, the colony is bounded on the S. by Bass's Strait. The extreme length is east and west, and is about 500 miles, by an extreme width, north and south, of 300 miles. But a remarkable indentation of both the north and south boundary opposite each other, about the middle of the colony, reduces the breadth between the head of the Port Phillip inlet and the Murray to only 120 miles. The superficial area is 55,671,840 acres, or 86,831 sq. miles.

Physical Aspect.—Although V. may be called mountainous, as compared with the general flatness of Australia, it has much of the quiet and peculiar scenery characteristic of that division of the world. Vast naked plains are deviously traversed by broad and deep river-channels, which are mostly, however, mere chains of ponds, if not altogether dry, excepting in winter and spring, or after heavy showers. Overspread, in cool and moist seasons, with brilliant verdure, the drought and heat of summer quickly convert the grass into a natural hay, which, in the scarcity of sustenance from its ceasing to grow in that condition, is eaten off to the very roots by the sheep and cattle, leaving the surface a bare and blackened mass. The 'open forest' is another and very pleasing variety of scenery characteristic of Australia, and largely prevalent in Victoria. It distinguishes the gently undulating country of the better soils, whose surface is overspread by large trees, chiefly of the red gum (*eucalyptus*) and silver wattle (*acacia*). The trees being widely apart and of spare foliage, and the surface free from underwood, there is commonly a good growth of grass, the whole presenting a charming and park-like aspect, although felt to be somewhat tame and monotonous, especially under the great defect of most Australian landscapes, the general want of water. Mountain and forest prevail most in the east division, where the Australian Alps of Gipps' Land, the loftiest of Australian chains, culminate in an elevation (Mount Strzelecki) of 6500 feet above the sea. The west district, on the other hand, is chiefly remarkable for its numerous isolated hills of volcanic origin, some of them with craters still perfect, which probably have not, in a geological sense, been very long at rest. To this extensive volcanic system, V. owes the large proportion of its good arable land, as compared with the light sandstone and granitic soils that prevail elsewhere in Australia. The chief rivers, besides the Murray and its branches (elsewhere treated of), are the Snowy River, the Thomson, the Mitchell, the Macallister, and the La Trobe—all of Gipps' Land; the Yarra-Yarra, on whose banks Melbourne is built; the Barwon, the Hopkins, and the Glenelg, of which rivers, however, the three last are not perennial streams. Australian scenic peculiarities are incomplete without its very remarkable fauna, notably the kangaroo or pouched family, and the emu or great wingless bird. There are besides the *echidna* and *platypus*, of quite a different family, and even more singular in structure, especially the last, as indicated by its other name of *Ornithorhynchus paradoxus*. The dingo, or native dog, is remarkable as a non-marsupial exception, on which account it has been regarded as an introduction by human agency. But several years ago, Professor M'Coy of Melbourne met with its fossil remains associated with those of extinct animals, and in deposits that, although recent, geologically speaking, are in other respects so remote as to establish this animal's indigenous claim.

Climate.—This is on the whole healthful and agreeable, but subject to frequent and sudden change in condition and temperature. The average temperature of the year is between 57° and 59°, or about 9° above that of London, and 11° above that of Edinburgh. The common summer-heat is from 65° to 80°, with an occasional advance to 90°, and even to 100°, during hot winds and a dry season. The winter-range is mostly from 45° to 60°. Ice occurs in the midwinter of July, but it rarely, except on elevated ground, survives the noonday sun. Every few years, an unusually severe season will cover the higher levels, and even the country generally, with snow, to recall to the colonists the familiar scenes of ancestral homes. The cold of winter is keenly felt, and household fires are not uncommonly indulged in for even six months of the year, especially in the morning and evening.

Civil and Political Divisions.—Victoria is divided into four districts and 37 counties, the principal counties being Bourke, Talbot, and Grant. Prior to 1848 there were but three counties, the still existing Bourke, Grant, and Normanby, laid out in 1837, along with the sites of several chief towns, when the infant settlement, then but two years old, was officially taken charge of by the New South Wales government, within whose jurisdiction the territory

was then comprised. One chief object of the counties was to distinguish by certain special regulations the more accessible and valuable of the colonial lands, leaving the remainder (the districts) to pastoral or squatting uses. But the subsequent discovery of the gold-fields, in 1851, interfered with this arrangement, as the new condition created towns and markets indiscriminately in county and district. Squatting is still an important colonial vocation, second only to gold-mining, and still pursued over most of the colonial area. The electoral districts, in general, coincide (but not always) with county and municipal divisions. This is the case for the Assembly, but for the Council or Upper House, there is a special division of the colony into six great districts. A law of the colony specially facilitates townships to become municipalities; and there are already in V. (census of 1861) 61 such towns, all of them with their respective mayors and corporations.

History.—The distinction of first settling V. is due to the Messrs Henty of Launceston, Tasmania, who occupied the south-west part at Portland Bay with some flocks of sheep in 1834. But the settlement that mainly influenced the future was that of the following year upon the shores of Port Phillip. This enterprise also was from Launceston, first in May and June by a small party under Batman, which occupied Indented Head, on the west side, 15 miles inside the harbour; and again in August following by another party sent forth by Fawkner, he himself having been detained a short while longer by sickness. This last party passed on to the head of Port Phillip, ascended the Yarra, and settled upon the site of the present capital, Melbourne. The story of the subsequent progress is marvellous even in an age of marvels as to colonies. When the gold mines were discovered, the settlement, after 16 years' existence, had a colonial population of 80,000, of whom nearly one-third were in the capital. Thenceforth for several years the advance has scarcely been paralleled. The imports, exports, and the public revenue increased ten-fold. In 1856, Melbourne had become a city of great wealth and commerce, containing 100,000 inhabitants, while the colony comprised above 400,000. The race has since been at a more leisurely speed. Melbourne has not grown much larger, but it has been greatly improved and beautified. See MELBOURNE. Some interior towns, however, are rising to importance, in particular, Ballarat, erected beside the first-discovered of the principal Victorian gold-fields. Geelong, with 15,026 of population, finely situated on the western arm of Port Phillip, was long second only to Melbourne, but is now surpassed by Ballarat with 47,201, and Sandhurst with 21,987. The population of V., in 1871, was 730,198, of whom 330,478 were females.

V., while a part of New South Wales, was termed the Southern or Fort Philip District of that colony. As early as 1840, an agitation for separation and a government independent of that of New South Wales began, and was ended successfully in 1851, when the new colony received the name it now bears. The title of Lieutenant-governor was then given to the Queen's representative in this colony, as well as in others adjacent, the Governor-general being in New South Wales. But the rising importance of V. led to this distinction being discontinued some years afterwards. This importance indeed expedited, to these colonies, their concession of self-government, which was inaugurated about seventeen years ago (1854—1856), with very lively demonstrations on the part of the colonists, who have since shewn no want of interest or earnestness in the charge of their own affairs. During this last brief term, although the progress in point of population, owing to diminished immigration, has been unimportant, there has been a very marked advance in the improvement of the colony generally, and of the arts and industries and amenities of social and commercial life. At the Great International Exhibition of 1862, V. stood at the head of the entire colonial department, its contribution having been officially described as 'embracing the largest and most varied collection of objects ever sent by a British colony to Europe.'

Population, Colonists.—The population of V., in common with that of the other members of the group, is in the main English, in the wider sense of the word. The whole foreign element, according to the census of 1861, did not exceed one-tenth. Of that proportion, more than one-half was Chinese, whose sudden irruption into the colony, above 12 years previous, was at once one of the many novelties, as well as one of the doubtful benefits resulting from the world-wide fame of the gold-fields. The Germans are the only other foreign element of any noticeable strength. They began to arrive in 1849, Australia having become favourably known to them by a considerable preceding emigration to Adelaide. They have proved, on the whole, an advantageous immigration, for although slow to adapt traditional usages to their new circumstances, they have set a commendable, and often a much-needed example of frugality, industry, and sobriety. The various divisions of the United Kingdom contribute somewhat rateably their quota to the colonial population. The census of 1871 gave the numbers in connection with the various denominations as follows: Church of England, 257,835; Presbyterians, 112,983; Methodists, 18,191; Independents, 16,311; Roman Catholics, 170,620; Lutherans, 3540; Baptists, 10,559; Jews, 3571. There are in the colony 1232 churches and chapels, besides 325 school houses and 577 other buildings also used for public worship. Pop. in 1881, 858,582.

Natives.—By the census of 1871, the aborigines were found to number 1333, consisting of 990 males and 343 females. Probably about 200 more had missed enumeration. The number when the settlement began is usually stated to have been 6000, although probably much larger, seeing that Tasmania, only one-fourth of the extent, and with a climate less genial to savage life, is supposed to have contained 5000. But that is a point about which we can now only conjecture. The native is fast dying out from the colonised area. The progress of colonisation has been utter destruction to his prospects. Philanthropic and Christian efforts on his behalf, although not absolutely barren, have had but little fruit. He does not rise to the level of the surrounding civilisation. As his hereditary mode of life is now on every side interfered with, he pines away in a purposeless existence, a victim to the vices, without the virtues, of the new order.

Commerce.—Prior to gold-mining, wool was the great colonial staple. It is still of great importance, the exportation from V. in 1871 having amounted to 76,334,480 lbs. weight, of the value of £4,702,164. The gold export for the same year was 1,647,389 oz., of the value of £6,590,962. After the gold discoveries in 1851, there came an extraordinary commercial development. For that year, the imports had been £1,056,437, and the exports £1,422,909. In 1854, the amounts were respectively £17,659,051 and £11,775,204. But this sudden extension—at least as regarded imports—was not maintained, because it was due, in part, to a temporary extravagance, and partly because the colony has since then been successfully organising its industry, so as to produce fully as cheaply and as

well many articles that were at first imported. For 1871, the imports were £12,341,995, the exports £14,-557,820. The shipping in the same year comprised, in all, 1,149,004 tons—namely, inwards, 655,329; outwards, 493,675. The gold production of V. has gradually diminished from £12,000,000, to which it rose in 1856, to a little over £6,500,000 in the year 1871. This diminution is partly made up to the world by the greatly increased gold-mining of late in New Zealand. The yearly production of all these colonies is now about £10,000,000, distributed thus: V. 5; New South Wales, 2; Queensland, ½; New Zealand, 2½. The greater part of this gold is usually sent direct to Britain; but the proportion is very irregular, depending on the state of the exchange with India. Thus, while in 1865, £5,051,170 was received in England, in 1864 it was only £2,656,971, and the year before it was £5,995,368. The total of Australian and New Zealand wool received in 1871 amounted in value to the sum of £10,845,830. The exportation of articles, the produce of Great Britain, to V. amounted for 1871 to the value of £4,244,006, and for all the others of these colonies to £5,881,109, making a total of £10,125,115. The chief articles of this exportation are apparel and 'slops' (i. e., ready-made clothing), boots and shoes, haberdashery, cottons, woollens and worsteds, and iron in various stages.

The chief colonial vocations are squatting, or pastoral pursuits, agriculture, and latterly, gold-mining. The first-mentioned was the earliest that rose to importance; but the last has rapidly outrivalled every other. Agriculture, at first dwarfed by the success and influence of squatting, and for a time impede afresh by the social upturning during the first years of gold-mining, is now, however, rapidly extending, and is improving, socially as well as physically, the aspect of the country.

Squatting.—This colonial term has long since passed from its originally semi-savage and outcast associations, to represent in Australia a rural aristocracy. The squatter, using the country just as he found it, placed upon it his live-stock, which lived and throve on the natural herbage. This ready adaptation of the surface, with comparatively little of preliminary outlay, is the chief cause of Australia's rapid progress. At first, the pastoral 'stations,' or 'runs,' as they were then very appropriately called, were unenclosed areas, parcelled out to a small number with a very bountiful hand, and at a nominal rent or occupation license-fee. Now, however, these areas have been much subdivided, and much has been done in enclosing the runs with stout fencing. By a late official return, there were in V. 1156 different stations, comprising an area of 31,875,468 acres, and contributing to the revenue a yearly rental of £225,113, 17*s.* 7*d.* The rate is from ¼*d.* up to 8*d.* per acre, according to a valuation of pastoral capability. The present number of sheep in the colony is 10,002,381; of cattle, 799,509; and of horses, 181,643.

Agriculture.—Comparatively little was accomplished in this branch for 25 years, until 1860, when the government began to increase the facilities for acquiring and cultivating the public lands. In 1861, there were but 180,000 acres under the plough; in 1871, the area had increased to 909,015 acres, including 284,167 acres in wheat, and 149,309 in oats, these two being the cereals most cultivated in the Australian colonies. The average yield for the season 1870—1871 was: wheat, 10.1 bushels; oats, 15 bushels per acre. These figures shew a great falling off from those of previous years. The dry climate of Southern Australia seems favourable to the quality of wheat; and the Victorian samples at the last Great Exhibition ranked amongst the very best. There were 5523 acres in vineyard. Vine-culture rapidly extends, and wine-making is now general, with a large consumption in the interior districts, and periodical public sales of the vintages.

Gold-mining.—This may now be termed one of the skilled labours of the colony; but it is not by any means, on an average, among the most remunerative. Of the two great branches of mining, viz. (1) the crushing of the auriferous rock for the washing out of the gold, and (2) the washing from the débris or 'drifts' which nature has already pounded down ready to the miner's use, the latter, as embracing the simpler process, was at first the most general, but more lately the other has been increasingly followed. By means of improved machinery, quartz-crushing has been steadily rising to the position of a comparatively regular and sure source of living. There were, on March 1, 1871, about 58,220 persons in V. directly engaged in mining; and 941 sq. m. of auriferous ground were actually worked upon.

Finances.—The public revenue is derived mainly from three different sources—customs' dues, land-sales and rents, and public works. The total revenue of V. for 1870 amounted to £3,261,883. The chief items were—customs, £1,318,974; land-sales, £367,565; public works (chiefly railway receipts), £643,451. The revenue for 1871—1872 was £3,825,195, in proportions somewhat similar. The income is generally ample for all expenses. The outstanding public debt amounted (Dec. 1872) to £11,994,800. About ⅘ths of this amount represents the cost of the railway system now completed, and traversing the colony from Port Phillip to the river Murray. The remainder is the cost of water-supply to Melbourne and other parts of the colony, and of aids to Melbourne and Geelong for town improvements. This debt exists in the form of debentures, nearly all bearing interest at 6 per cent., and due at various terms up to 1891. These debentures are nearly all, excepting about one million, held in Great Britain, and are well known in the London market, the chief stock being 'The Railway Loan' of £7,000,000.

Taxation, according to the revenue accounts, amounts to a little over £5 per head. Deducting, however, the revenue from railways and from the sales of land, the amount per head is reduced by one-half, bringing it to about the same as in this country, although more equally distributed, owing to the greater equality of condition among the colonists, and more equal consumption of articles subject to customs' dues. The customs' revenue is derived mainly from strong drinks and tobacco. There are also moderate duties on sugar, tea, and coffee, and various other articles. Municipal and road-district taxation are additional.

Political Institutions.—The self-government conceded to V. and the adjacent colonies gives them a responsible system similar to our own. The governor represents the sovereign who appoints him; and he governs by ministries, who are of the crown's, that is, of the governor's nomination, but who must possess the confidence of parliament. There are two houses of legislation, both in V. being elective—the Council or Upper House by a high and special qualification, the Assembly by manhood suffrage, without any qualification for members. Elections are by secret ballot. The term of the governorship is usually seven years. The present salary of the office in V. is £10,000 a year; and in the expensive times more immediately succeeding the gold discoveries, it was £15,000. New South Wales allows he governor £7000. Judged by the criterion of salary, the Victorian appointment is the most important of the colonial list, the governor-generalship of India

excepted. The salary is paid wholly by the colony; but by a recent imperial act, the home government allows moderate pensions to retired governors, according to the term of service—a measure that had been called for in face of occasional reverses of fortune to the later life of persons who had previously represented royal splendour.

Religion.—The divergence of the British self-governed colonies from home example is perhaps most striking in two very important subjects—religion and education. In religion, as in politics, the tendencies are towards a complete equality, and therefore opposed to the privileges involved in church establishments. In this respect, change of scene, and equality and independence of condition, sensibly weaken the strength of tradition and usage as exhibited in the senior country. All religious bodies, therefore, stand alike before the civil power, none having any coercive jurisdiction except such as its own members voluntarily impose upon themselves, either by their own rules, or by a special act solicited from the colonial legislature. In V. there is still a yearly dotation of £50,000 from the public revenue to the support of religion. It is distributed rateably among the sects, Unitarians and Jews included, and is 'scheduled'—i. e., not subject to yearly vote—under the Constitution Act. This system had been introduced into Australia thirty years ago, as a substitution for the preceding Church of England supremacy. More lately, the public feeling had tended to a disapproval of this system of indiscriminate support to religion, and some of the smaller bodies had altogether rejected it. The state aid has therefore been abolished in some of the colonies. In V. a few years ago, after many trials, a bill passed both houses whereby the grant in aid of religion wholly ceased in 1875.

Education.—The energy displayed on this subject by the popular administrations of the self-governed colonies, and the tenacious persistence with which they encounter the problem of the education of the whole people, are among the best results presented to us by these young offshoots. Under the preliminary 'imperial régime' of colonial public life, the comparatively neglected field as to education is taken up, and with creditable zeal, by the various clergy, who institute, of course, the denominational system. But their main object being to inculcate their respective religious views, a general education of the people under this system, almost impossible anywhere, is altogether so in the thin populations of colonies. A national system, to compete with the previously established denominational, had been introduced into New South Wales and V. with the advent of the partially representative legislatures that for about twelve years preceded the present self-government. National and denominational, each conducted by a separate board of management, were alike aided by the state. After much debate, political and religious, the institution of a national system and of a single board was carried in the Victorian legislature in 1862. Four years afterwards, the same system carried in New South Wales, after similar debate and repeated failure. The system was in effect that all state assisted schools must be open to the children of all religious bodies, and that four hours daily of secular teaching be imparted to every pupil. This arrangement, on experiment, was unsuccessful. Schools still remained in connection with the several denominations; denominational school committees controlled the election of teachers, who were also permitted to impart religious instruction when desired. As a result, schools were unnecessarily multiplied in some localities, and the money of the state was wasted in their support. After various attempts to establish a system of state schools unconnected with any denomination—attempts which several of the religious bodies combined to defeat—the Victorian government, in the late session of parliament, succeeded in overcoming all difficulties, and a bill passed both houses of the legislature which completely establishes a national, as opposed to a denominational, system of education. The total number of schools in V. is 1867, including 908 'common' schools, with a total attendance of 154,353 scholars; total cost of maintenance, £249,762.

Remarks to Emigrants.—Intending emigrants should understand that V. is no longer a new and scantily-peopled territory, with all the superabundant employment and means of subsistence that are readily found now-a-days on such a scene by help of the arts and implements of an advanced civilisation. There are now in the colony the advantages of a settled society, having much of the amenities of home-life; but, on the other hand, the colonial vocations are tolerably filled up by the increasing population, so that the unsuitable or the inexperienced have hardly any better chance out there than here. It is owing to considerations of this kind that the system of free or assisted emigration—a system still maintained to a limited extent by the colony—has been latterly conducted upon very strict principles; the object being, that persons unsuitable to the colony may, as far as possible, be prevented from going there. The government emigration is now placed under the care of the Commissioners for Emigration, Park Street, Westminster. The latest regulations are those of July 1865, and they give free and assisted passages to certain eligible persons of both sexes, with special encouragement to the emigration of females. The *free passages* are given to domestic servants of from 18 to 25 years, and to married agricultural labourers and their wives not exceeding 40 years, with not over two children under 12 years. All must provide proper outfit, and pay besides 10*s.* per adult towards bedding as supplied to them on shipboard. There is also, to a limited extent, a system of *assisted passages*, by which suitable persons are granted passages, subject to their paying a part of the cost. The payment varies from £1 for females, and £2 for males, above 15 years, up to £5 and £8 respectively for those of 40 years and upwards. A third system enables residents of the colony to bring out eligible persons of their own nomination, by taking out *passage warrants*, subject to like payments and conditions as those just given. In all cases, there is special encouragement to female emigration, as there is still a marked sexual disproportion in the colony. As a general rule in V. at present, wages and remuneration generally are one-third or one-fourth higher than in England; while the chief requirements of life are, one with another, at about the same price as they are in the latter country. House-rent is rather higher, while butcher-meat is cheaper, and other articles about equal. The climate is, as a whole, highly enjoyable, with its bright skies and sunshine; but to working-men, six months of the year (from the middle of October to the middle of April) will be found somewhat oppressive for great physical toil—a consideration no doubt present to the working-classes of the colony in connection with their successful introduction of an eight-hours' labour system. There are now more facilities than the colony formerly enjoyed for acquiring land at a reasonable price, and the climate has been found quite suitable for the cultivation of all the cereal crops of this country, as well as the grape and other fruits, the gift of a temperature more genial than that of England.

VICTORIA, a city, capital of the colony of British Columbia, stands at the south-east extremity of Vancouver's Island, 320 miles from Portland, Oregon. Three miles from V. is the harbor of Esquimault, the western terminus of the Canada Pacific Railway. V. was originally a trading establishment or fort of the Hudson Bay Company, but now contains churches of the various denominations, several hotels, about 40 stores, 4 breweries, ship-yard, &c. Two daily and two weekly newspapers are published here. Value of imports in 1872, \$1,790,352; exports, \$1,915,107. Pop. 5925. See VANCOUVER'S ISLAND.

VICTORIA, a seaport of Brazil, capital of the province of Espiritu Santo, stands on a bay of that name, 270 miles north-east of Rio de Janeiro. It has a good harbour, an active coasting-trade, and about 6000 inhabitants.

VICTORIA, a genus of plants of the natural order *Nymphæaceæ*, resembling the common water-lily, but most nearly allied to the genus *Euryăle*, and distinguished from it particularly by the deciduous tips of the calyx, and the sterility of the innermost stamens. Only one species is yet known, *V. regia*. This is said to have been first observed by Hänke, about 1801, and afterwards to have been seen by Bonpland, D'Orbigny, and others. It was first described in 1832 by Pöppig, who observed it in the river Amazon; and it has since been found by Schomburgk and others in many rivers of the north-east of South America. Its leaves are orbicular, float upon the water, and attain a diameter of 5—6 feet; have the margin turned up, and about two inches high; are of a purplish colour on the under side, and there exhibit a sort of wicker-work of very prominent veins, furnished with prickles. The flowers rise amongst the leaves upon prickly stalks. They are more than a foot in diameter, white, internally rose-coloured, and are very fragrant. The fruit is a capsule, almost globose, with a depression on the top, about half the size of a man's

Victoria regia, flower and leaf.

head, fleshy within, and divided into numerous cells, full of round farinaceous seeds, which are an agreeable article of food. The plant is therefore called *Maïs del Agua*, or Water Maize, in some parts of South America. To the cultivation of this plant, special hothouses have been devoted in some places in Britain and also in the United States. It has been introduced into India from seeds produced in England.

VICTORIA BRIDGE, across the St Lawrence at Montreal, on the Grand Trunk Railway of

Victoria Bridge, Montreal.

Canada. This, the greatest tubular bridge in the world, was begun in May 1854, and finished in December 1859. The engineers were Robert Stephenson and Alexander M. Ross. The dimensions and other particulars are stated in the article TUBULAR BRIDGE; and the accompanying view will help to give a conception of the vastness of the structure.

VICTORIA CROSS. See CROSS, VICTORIA.

VICTORIA LAKE, called also ALEXANDRINA or KAYINGA LAKE, a brackish lagoon in the south-east of South Australia, is separated from the sea only by a narrow belt. It receives the rivers Murray, Bremer, Angus, and Finnis, and communicates with the sea by a narrow passage that leads into Encounter Bay. It is 30 miles long, and about 12 miles broad. A sand-bar at the entrance to the lake impedes access for vessels from the sea; but the interior navigation is safe.

VICTORIA-NYANZA. See NYANZA.

VICU'GNA (*Auchenia Vicugna*), a species of the same genus with the lama and alpaca. It is a more beautiful animal than any of its congeners. In size, it is intermediate between the lama and the alpaca. Its neck is longer and more slender than theirs; its wool is also finer, short, and curled. It is of a rich brown colour, with patches of white across the shoulders, and the inner side of the legs. The V. inhabits the most desolate parts of the Cordillera, at great elevations; and delights in a kind of grass, the Ychu (*Stipa Ychu*), which abounds there in moist places; but it seldom ventures to the rocky summits, for which its tender feet are ill adapted. It is commonly found in small herds of from 6 to 15 females with one male. When the females are quietly grazing, the male stands apart, and carefully keeps guard, giving notice of danger by a kind of whistling sound, and a quick movement of foot. When the herd takes to flight, the male covers their retreat, often pausing to observe the motions of the enemy. If he is wounded or killed, the females gather round him, and will suffer themselves to be captured or killed, rather than

desert him. The V. is a very active animal, like the wild goat or the antelope. The Indians seldom kill it with firearms, but set up a circle of stakes, about a mile in circumference, into which the vicugnas are driven.—A hybrid has been produced between the V. and the alpaca, which has a black and white fleece of long wool, resembling the richest silk.

VIDOCQ, François-Jules, who acquired notoriety as a detective-officer of police at Paris, was born on 23d July 1775, at Arras, where his father was a baker. On the principle of set a thief to catch a thief, his earlier life may be regarded as an almost invaluable apprenticeship to the profession in which he afterwards became distinguished. As a boy, he was employed in his father's shop, the till of which, it was found, he persistently robbed. To cure him of this evil habit, he was sent to the house of correction; but so little were his morals improved there, that he signalised his return to business by decamping with a sum of about £80. Of this money, a sharper relieved him at Ostend; and in order to keep himself in life, he engaged himself to sweep the cages of a travelling menagerie. From this menial service he was advanced to the post of tumbler and acrobat; and a further promotion was intended him to that of a supposed savage, whose performance involved the eating of raw flesh, and drinking greedily of blood. As he saw fit to decline the appointment, his further services were dispensed with; and shortly after, he returned to his father. Having entered the army, he attained the rank of corporal, and served with some credit in Belgium and elsewhere, till a wound obliged him to return home. For some years after, he seems to have lived as a scoundrel at large, occupying himself in swindling and disreputable love-affairs. In 1796, he turned up in Paris, and being detected in forgery, he was sentenced to pass eight years as a galley-slave. Before his term of durance had expired, he found means to escape, and became one of a band of highwaymen. As the story goes, his new associates, on chancing to discover that he was an escaped galley-slave, saw fit to decline his further acquaintance. This refinement of squeamishness on the part of these gentlemen of the road, seems not in itself very probable; but on whatever ground of dislike, they desired to rid themselves of M. V., and summarily did so, exacting from him a solemn oath not to betray them. M. V. took the oath very solemnly, and instantly proceeded to deliver the whole gang into the hands of the authorities. This pretty exploit seems to have suggested to him the *rôle* which he afterwards developed with such consummate success. Hieing to Paris, he offered his services to the authorities there as a spy upon the criminal classes. His advances were at first coolly received; but gradually he made his way; and shortly his services became so important that official recognition was vouchsafed him. In 1812, a 'Brigade de Sûreté' was organised, with V. as chief. Consisting at first of only 4 men, by degrees it was enlarged till it came to include 28; and its efficiency was something marvellous. Suspicions, however, grew rife that V. was himself the originator of many of the burglaries he shewed himself so clever in hunting out, and even contrived to make a good thing of them. It does not appear that this charge was in any case clearly brought home to him; but M. V. being plainly the sort of person in whom any suggested blackguardism is rather more likely than not, it had every inherent probability. Guilty or not as he may have been, so strong was the popular feeling against him that, in 1825, it led to his being superseded. After his dismissal, he became a paper-manufacturer; and in 1834, established a Trade Protection Society, the object of which was to furnish confidential information as to parties whose credit might be dubious. In 1829, he published an Autobiography, a *rédaction* of which he put forth in 1844 (Eugène Sue's famous novel having just taken the public by storm), under the title of *Les Vrais Mystères de Paris*. Finally, he died in Belgium in the year 1850.

VIE'NNA (Ger. *Wien*, Lat. *Vindobona*), capital of the Austrian Empire, stands on a plain, surrounded by gently-sloping hills, 251 miles south-east of Prague by railway. An arm of the Danube, serving the purpose of a canal, passes along the north-east side of the city, and separates it from the suburb of Leopoldstadt. Into this arm flows a foul and insignificant stream, called the Wein, and from this stream the old city derives its name. V. consists of the old city or inner town, nearly a mile in length, and half a mile in breadth, with narrow streets, and about 55,000 inhabitants, and of a circle of suburbs 36 in number, which completely surround the central part. All around the old town, and between it and the suburbs, is a ring of open space from 600 feet to 15,500 feet broad, covered with grass, laid out in walks and in avenues planted with acacia and chestnut trees. This space was the glacis of the fortifications, which, since 1857, have been demolished. The suburbs are of comparatively recent erection—the former suburbs having been destroyed on the occasion of the last siege of V. by the Turks in 1683. The streets of V.—broad and straight in the suburbs—all run to a point in the centre of the inner city, like the spokes of a wheel, or the converging threads of a spider's web. Surrounding the suburbs is a wall over 12 feet high, and pierced by 13 gates. This wall forms what are called the *lines* of Vienna. Unlike most other European cities, the old part of the city is the most fashionable. In the old or inner town are the palaces of the emperor and of some of the principal nobility, many stately mansions, the public offices, the finest churches, most of the museums and public collections, the colleges, the exchange, and the most splendid shops. The suburbs are laid out in wide streets, many of which, being unpaved, are muddy in winter, and dusty in summer. Among the principal squares are the *Josephsplatz*, with an equestrian statue of the Emperor Joseph II.; the *Burgplatz*, with a colossal bronze statue of the Emperor Francis; the outer *Burgplatz*, with an equestrian statue of the Archduke Charles; the *Neumarkt*, with a fountain embellished by four figures, representing the rivers of the archduchy of Austria—the Ens, Ips, Traun, and March; the smaller square, called the *Freiung*, with a much more beautiful fountain, adorned with five figures, representing Austria and the four chief rivers—the Danube, Vistula, Elbe, and Po—of the Austrian dominions. V. is the see of an archbishop; and of all its churches, of which there is a large number, the chief is the cathedral of St Stephen's, one of the most beautiful Gothic edifices in Germany. It is 345 feet long, 230 feet in greatest breadth; was founded—on the site of an older church, parts of which still remain—in 1359, and completed in 1480. It is roofed with coloured tiles, and its exterior presents much rich tracery and curious carvings and monuments. The interior is gloomy; but the lofty nave, the pillars of extraordinary size, the rich sculptures, and the old brilliant painted glass, combine to render it very beautiful. The south tower, a masterpiece of Gothic architecture, was 449 feet in height in 1864; but in that year, when the spire was being restored, it was intended to increase the height by 15 or 20 feet. The Capuchin Church contains the burial-vault of the imperial family; the Church of the Augustines is remarkable

for its monument of the Archduchess Christina of Saxe-Teschen, one of the most successful works of Canova. Other important churches are those of Maria-Stiegen, in the purest style of Gothic; the *Votif-Kirche*, also a noble Gothic structure; and the New Synagogue, superbly decorated in the interior. The Imperial Royal Palace is an ancient building consisting of various parts erected at different times. Adjoining the palace, or forming part of it, are the Imperial Library, Riding-school, Jewel Office, several collections, and the Burg Theatre. The Archduke Albert's Palace contains a library, and one of the finest collections in Europe of engravings and drawings, comprising among the latter Raphael's own sketch of the Transfiguration. The Imperial Arsenal contains manufactories of all sorts of weapons, and an armoury containing one of the largest and finest collections of arms and ancient armour in Europe. The Ambras Museum contains the most interesting collection of armour of the 16th c. in Europe, besides collections of art-treasures, and many excellent pictures, among which are several by Paul Veronese, Titian, Raphael, Salvator Rosa, the Caracci, Correggio, Rubens, Van Dyck, Ruysdael, and others. There are other collections of pictures, as those of Count Czernin and Count Schönborn. The Polytechnic Institute is attended by 500 pupils, who are taught in science, the arts, and in trade, commerce, and manufactures. The university, founded in 1237, is attended on an average by 2000 students, more than half of whom receive gratuitous instruction. The professors, about 80 in number, receive their salaries from government. As a school of medicine, the university of V. is celebrated over the continent. There are numerous schools and charitable and benevolent institutions. Among the latter are the General Hospital, with accommodation for 3000 patients. The glacis, already mentioned, the private gardens attached to the palaces of Prince Schwarzenberg, the *Augarten*, and the *Prater*, the last being the Hyde Park of V., are the principal places of public resort and recreation. V. contains eight theatres, of which the *Hofburg* and the *Kärnthnerthor* theatres, and the *Theater an der Wien*, are the chief. The manufacture of silk-stuffs is an important branch of industry, and 4000 persons are employed in the weaving of shawls. But the most flourishing trade is the manufacture of meerschaum pipes, in which much skill and artistic taste are displayed. Glove-making is also carried to much perfection, and the trades and manufactures common in large capitals are carried on. Pop. (1869) 607,514; (1873) of V. and suburbs proper about 850,000; and in 1880, 1,003,857. See AUSTRIA.

VIENNA, TREATIES, &c., OF. This capital, from its central position, and from the prominent part which Austria has always taken in the wars of modern Europe, has been oftener selected than any other city (Paris perhaps excepted) as the meeting-place of the representatives of the various European nations. The *first* treaty of V. (April 30, 1725) was a mutual guarantee of their dominions by the Emperor Charles VI. and Philip V. of Spain; besides which, the former agreed to aid in the recovery of Gibraltar from Britain, and to aid the Pretender in supplanting George I. in consideration of the latter guaranteeing the Pragmatic Sanction. The *second* treaty (March 16, 1731) was a joint guarantee of the Pragmatic Sanction by George II. of Britain and the States of Holland. The *third* (November 18, 1738) was a similar guarantee by Louis XV. of France, in consideration of the reversion of Lorraine and Bar (to be given meantime to Stanislas, the ex-king of Poland), as well as a settlement of the Polish succession dispute, and a rearrangement of the possessions of Austria, Spain and Sardinia, in Italy. The *fourth* treaty (October 14, 1809) was concluded between France and Austria, after the battle of Wagram, and the armistice of Znaim, by which the latter agreed to resign some districts on the western border of the archduchy to Bavaria; Goritz, Friuli, Trieste, Carniola, and parts of Croatia, Carinthia, and Dalmatia. to France, these provinces to be formed into the government-general of Illyria; some districts of Upper Lusatia to the king of Saxony; Western Galicia, with Cracow and Zamocz, and a share in the salt mines of Wielicza, to the grand duchy of Warsaw; and the eastern corner of Galicia to Russia: a total loss to Austria of 58,170 sq. m., with a pop. of 3,500,000, and all her seaports.

The next, and by far the most important meeting of the representatives of European nations, was the *Congress of Vienna*, which was held here after the first treaty of Paris, for the general settlement of the affairs of Europe. The congress, which first met on September 30, 1814, was composed of the Czar Alexander I. of Russia, with Count Nesselrode; the king of Prussia, with Hardenberg; Lord Castlereagh, and afterwards the Duke of Wellington, as representatives of Britain; Prince Metternich for Austria; Count Talleyrand for France; as well as representatives of Spain, Portugal, Sweden, Rome, Germany, and all the other minor powers, who were interested personally in the deliberations: the total number of those who assisted at the congress being about 500. But the representatives of the minor states, who had expected a species of European parliament, to which all would be admitted, were sadly disappointed by the preliminary resolution of the great powers to constitute two committees, one of which would deliberate on the affairs of Germany; and the other, composed only of the representatives of Austria, Prussia, Russia, and Britain, would discuss the affairs of Europe generally, decide respecting the partition of the conquered districts (formerly belonging to France and her allies), and the frontier of each European sovereignty. To this latter council, Talleyrand, by the influence of Castlereagh, who early saw the necessity of a counterpoise to the influence of Russia and her follower, Prussia, in the conferences, was admitted (October 5); and three days after, it was increased by the representatives of Spain, Sweden, and Portugal. The first resolution of the European committee, to rearrange Europe so as to leave the parties directly interested nothing more to do than give their adhesion to the arrangements made for them, being an arrogation of sovereignty over all Europe, was loudly exclaimed against; but the congress was one of rulers and *their* representatives, and not of the nations and *their* representatives, so the indignant clamour which rose on all sides was quite unheeded. The points which were at once and unanimously settled were—the constitution of Belgium and Holland into one kingdom (*the kingdom of the Netherlands*); the annexation of Norway to Sweden; the restoration of Hanover, with a large slice of Westphalia, to the king of Great Britain; of Lombardy to Austria; and of Savoy to Piedmont. But the questions as to the disposal of Poland, Saxony, and Genoa were not so easily settled. Russia and Prussia, overweeningly vain of the prominent share they had had in crushing Napoleon, were bent on aggrandisement of the most extravagant sort; the former loudly insisting on obtaining the whole of the grand duchy of Warsaw (see POLAND); while nothing less than the whole of Saxony, and some of the trans-Rhenish provinces of Westphalia, would satisfy the latter; and both significantly

hinted at the proximity of their colossal armies, with the view of awing the other powers into compliance. But Castlereagh was not the man to be so influenced; and while steadily refusing to yield an iota to such preposterous pretensions, he joined with Metternich and Talleyrand in a secret treaty, offensive and defensive, February 3, 1815; which was cordially acceded to by Hanover, Sardinia, Holland and Bavaria. The news of this agreement soon leaked out, and produced a considerable modification in the pretensions of the northern powers. At last it was agreed that Prussia should obtain a portion of Saxony (now Prussian Saxony), Posen, Cleves, Berg, the greater part of the left bank of the Rhine as far as the Saar, and Swedish Pomerania; and cede East Friesland, Hildesheim, &c. to Hanover, Anspach and Baireuth to Bavaria, and Lauenburg to Denmark: while, with the exception of Posen, Thorn, and those parts of the grand duchy which had been (1809) taken from Austria, Poland was to be erected into a kingdom separate from Russia, but under the rule of the czar. Austria recovered the cessions which she was forced to make in 1809, obtained also the Valteline from Switzerland, and the establishment of collateral Hapsburg lines in Tuscany and Piombino; while Maria-Louisa obtained Parma. The pope was replaced in his former position as a temporal sovereign; the ancient constitution of Switzerland re-established; and Genoa—despite the strongly expressed aversion of its inhabitants—incorporated with Sardinia. The news of Napoleon's return from Elba somewhat hurried the conclusion of these multifarious arrangements, yet the negotiations were not interrupted; Metternich's scheme for a new confederation of the German states (the same which has continued till 1866) was unanimously agreed to, the question of mutual indemnities, rectifications of frontier, &c., being subsequently settled (July 20, 1819) at Frankfurt, by a territorial commission composed of representatives of the four great powers. The questions of the slave-trade and of the free navigation of the Rhine and its tributaries, were brought up by England, and also satisfactorily settled. Finally, a formal treaty (the *fifth treaty of Vienna*) was drawn up and signed, June 9, 1815.

VIENNA PASTE is a preparation which is extensively used as an encaustic, although it is not contained in the Pharmacopœia. A mixture, termed *Potassa caustica cum calce* (Caustic potash with lime), which is itself a caustic, and is much employed for producing issues, is first prepared by mixing equal weights of caustic potash and freshly-burned lime in a warm mortar, and rubbing them to a powder, which should at once be placed in an air-tight bottle. The caustic powder of which Vienna paste is made is obtained by similarly mixing 50 parts of the preceding compound with 60 of quicklime. It must be kept in a well-stoppered bottle; and when required for use, the powder is made into a soft paste with a little spirit, and applied to the part it is desired to cauterise. It is much employed by some physicians in certain affections of the womb; and is one of the best applications to an indurated chancre. See SYPHILIS.

VIENNE, an interior dep. in the west of France, bounded on the N. by the deps. Maine-et-Loire and Indre-et-Loire, and on the W. by Deux-Sèvres, which intervenes between this and the maritime dep. of Vendée. Area, 2690 sq. m.; pop (1872) 320,598. The Vienne, an affluent of the Loire, is the principal river, and all the other streams of the dep. are tributary to it. It flows from south to north, and receives the Clain, Gartempe, and Creuse—of these, the last only is navigable. The surface is flat, with a gradual slope toward the north. The country consists almost wholly of fertile plains, fine pasture-lands, and extensive forests. The climate is soft, temperate, and healthy. Grain is cultivated in greater quantity than is required for local consumption. On an average, 13,200,000 gallons of wine are produced annually. In general, however, agriculture is in a backward state. The mineral riches of the department consist principally of iron and manganese, and numerous quarries of building and other stones, including lithographic stones, which are finer and harder than those of Munich. The dep. is divided into the five arrondissements of Poitiers, Châtelherault, Civray, Loudun, Montmorillon. Poitiers is capital.

VIENNE, one of the most ancient towns of France, in the dep. of Isère, on the left bank of the Rhone, 19 miles south of Lyon by railway. The river Gère passes through the town, and here joins the Rhone, after having supplied motive-power to a number of mills and factories. V. was the chief town of the Allobroges, is mentioned by Cæsar (*De Bello Gallico*, vii. 9), and by Martial, who terms it *opulenta Vienna.* At the time of the Roman emperors, it was the rival of Lyon. Besides numerous water-conduits, &c., of Roman construction, there is a temple supposed to have been dedicated to Augustus, and which is now used as a museum, and contains a number of ancient Roman remains. There are also a Roman arch, remains of a theatre, and an obelisk, called L'Aiguille, 72 feet high; and the cathedral of St Maurice, a stately Gothic edifice, with much delicate carving. Manufactures of coarse woollens are carried on; and there is a good trade in wine. Population (1872) 19,844. In 1312, a council was held here, in which Pope Clement V. pronounced the suppression of the order of the Templars.

VIENNE, HAUTE, an interior dep. of France, bounded on the west by the deps. of Vienne, Charente, and Dordogne; area, 2130 sq. miles; pop. (1872) 322,447. It is watered by the Vienne and its tributaries—the chief of which is the Gartempe. The surface is for the most part level; but traversed by ranges of low hills, of which the Monts du Limousin, which traverse the south of the dep. from east to west, rise in their highest summit to 3000 feet. The Mont de Puy-Vieux, the highest in the dep., is 3200 feet above sea-level. The climate is cold, humid, and frequently foggy. The soil is not fertile, and agriculture is in a very backward condition. There are, however, extensive meadows, and the domestic animals are reared in great numbers. Mines of iron, lead, and copper are worked. The dep. is divided into four arrondissements. Capital, Limoges.

VIERSEN, Prussia. See SUPPLEMENT in Vol. X.

VIETA (otherwise given VIET, VIETTE, or DE VIETTE, and by himself Latinised into VIETÆUS), FRANÇOIS, the most eminent French mathematician of the 16th c., was born at Fontenai-le-Comte, near La Rochelle, in 1540. Of his early life and education we know nothing, and almost all our acquaintance with the details, meagre as they are, of his personal history, is derived from the records of his friend, De Thou (q. v.). V. was employed throughout his whole life in the service of the state under Henry III. and Henry IV., and devoted only his hours of leisure to the study of mathematics and other subjects—affording an excellent illustrative argument against the belief that abundant leisure is essential to high eminence, and in favour of the contradictory theory that mental work of whatever sort tends to prepare the mind for any other species of thought-labour. V. was a zealous

Roman Catholic, and a strenuous supporter of the doctrine of the divine right of kings. His genius and persevering industry brought him prominently into notice on various occasions. During the war against the Spaniards, the latter, to preserve as much as possible their communications with their numerous outlying possessions, and prevent the French from profiting by information from intercepted letters, adopted a species of cipher (see CRYPTOGRAPHY) of more than 500 characters, each varying from time to time in its signification. Some specimens being intercepted, were submitted to V., who after a time discovered the key to the cipher, to the great discomfiture of the Spaniards, who, incapable of accounting for the discovery otherwise, attributed it to magic; though the story that V. was summoned to Rome to defend himself before the pope against the charge of having dealings with the devil may safely be regarded as untrue. V.'s next prominent appearance was as an assailant of the Gregorian calendar, in opposition to which he published (1600) a 'true Gregorian calendar,' which was with justice considered by his contemporaries as inferior to that which obtained the papal sanction. However, V. did not, or would not, see his error, and attacked the Jesuit Clavius, to whom the pope had intrusted the compilation of the calendar, in a bitterly abusive manner; displaying, however, such a mastery of knowledge, that one of Clavius' defenders was led to sympathise with the unfortunate Jesuit who had to withstand the assault of one who was at once a lawyer, theologian, mathematician, orator, and poet. V., however, is almost exclusively recognised by posterity as a mathematician; yet, though worthy to rank among the highest of this class, immediately after such men as Newton and Lagrange, the incessant state of politico-religious turmoil in which France was kept during his life, and the fact that all his works printed during his life were set up at his own expense, and distributed among his friends, have hitherto hindered a general recognition of his high merit. The Italian tabulators of the progress of mathematical science have thus had a good opportunity of decking out their national idols (Cardan, especially) with plumes stolen from the obscure French investigator. The claims of V., however, are now becoming more and more generally recognised. He is indisputably entitled to be considered as the creator of modern algebra, which he established on the footing of a purely symbolical science; he applied his algebra to the extension of trigonometry, discovering the relations of multiple angles; and he extended the ancient process of extracting square and cube roots to the solution of all equations, an extension which has been since modernised and modified, and now appears as *Horner's method*. Besides, he proved his superior mathematical powers, by solving problems which had puzzled Apollonius, Regiomontanus, &c.; and was acknowledged by the mathematicians of Belgium and Italy as their master. Yet, strange to say, his own countrymen, the French, have so little knowledge of the surpassing talents and achievements of V., that, omitting all intelligent mention of his peculiar successes, they ascribe to him praises due to his Italian predecessors, and to his great English successor, Newton. Most of V.'s works were collected by Schooten, and published by the Elzevirs, at Leyden, in 1646. Two other works of his have been recently discovered, the *Harmonicon Cœleste* and the *Canon Mathematicus*, the latter the first table in which the trigonometrical functions of an angle are completely given. Of the first, two MSS. exist; while the second was printed and circulated according to V.'s usual fashion, and has long been a bibliographical curiosity; but neither has yet been published. See Knight's *Eng. Cyc.*, art. 'Vieta.'

VIGAN, LE, a small, prettily situated town in the south of France, in the dep. of Gard, 45 miles west-north-west of Nîmes. It carries on a trade in wine, oil, mules, horses, and silk. Silk and cotton fabrics are manufactured; and hides are tanned, known as Vigan hides. Pop. about 6000.

VIGE'VANO, a town of Northern Italy, in the province of Novara, 15 miles south-east of the town of that name. It stands on a rising ground on the banks of the Mora, and is surrounded by walls. It manufactures silk, linen, and cotton fabrics, and has an active trade in grain and wine. Pop. 17,673.

VIGIL (Lat. *vigilia*, Fr. *vigilo*, I watch), a preparatory time of devotion, which, by a very ancient Christian usage, went before the more solemn festivals, and especially Christmas, Easter, Pentecost, and the principal martyrs' days. In English, it was called 'Eve' or 'Even,' a name which is still retained in relation to several festivals, as Christmas Eve, Hallow-e'en, &c. The observance is traceable in the very earliest centuries, and was established everywhere in the 4th and 5th centuries. It is one of the usages of his time against which Vigilantius inveighs, and which Jerome vindicates in his celebrated *Letter against Vigilantius*. On the day before the great festivals, which seems from the first to have been held as a fasting-day, the people assembled in great multitudes. The services proper to the vigil, but having a certain bearing on the coming festival, were celebrated; the night was spent chiefly in the church and in prayer, and other devotional exercises; but abuses arose out of these night-watches, which led to their suppression, as well as to the abolition of certain festivities which grew up in connection either with the vigil or with the feast itself. The observance of vigils is still retained in the Roman Catholic Church, and with it all the ecclesiastical offices, together with the fast, at least in the great vigils of Christmas, Easter, Pentecost, Saints Peter and Paul, Assumption, All-Saints, &c.; but all the other details of the celebration have gone into disuse. In the English Prayer-book, the 'vigils or evens' of the chief festivals of our Lord, of the Blessed Virgin Mary, and of the Apostles are retained in the Calender; but they have no special services appointed for them, nor any other celebration.—See Blunt's *Annotated Common Prayer*, p. 28.

VI'GNETTE (Fr. little vine, a tendril; Lat. *viticula*), a term originally applied to the flourishes in the form of vine tendrils, branches, and leaves with which the capitals in ancient manuscripts were often surrounded. Similar decorations were introduced into printed books, and all kinds of printers' ornaments, such as head and tail pieces, came to be designated as vignettes. More recently, the name has been applied to engravings not enclosed in any definite border, and which are generally placed on the title-page of a book, opposite to the frontispiece.

VIGNY, ALFRED, COMTE DE, a French poet and novelist, was born at Loches in Touraine, March 27, 1799, and educated at Paris. After spending some time as a soldier, he married, in 1826, a wealthy Englishwoman; and two years later, withdrew from the army, in order to devote himself exclusively to literature. He died September 18, 1863. V. belongs to the Romantic school, but is free from all their extravagance of style and sentiment. No modern French poet exhibits an equal refinement and delicacy. His principal works are *Poëmes* (1822), *Poëmes Antiques et Modernes* (1824—1826), among which are his famous *Moïse*, *Dolorida*, and *Eloa*;

Cinq-Mars (1826), a historical romance of the time of Louis XIII., which is much admired in France, and has gone through more than a dozen editions; *Stello ou les Diables Bleus* (1832); *Servitude* and *Grandeur Militaires* (1835)—two very striking and suggestive novels; *La Maréchale d'Ancre*, and *Chatterton* (1835)—dramas of considerable merit. Besides these, he published *Consultations du Docteur Noir* (1856). A posthumous work appeared in 1864, entitled *Les Destinées, Poésies Philosophiques.*

VI'GO, an ancient town and seaport on the north-west coast of Spain, beautifully situated on a bay of the same name, about 85 miles north of Oporto. Its delicious climate renders it important as a medical station; and its position on the slopes of a hill, overlooking a charming bay, and forming the centre of a scene, oriental in its wealth of palms, orange-groves, flowers, and orchards, is likely to tell in its favour as a residence for the rich. Its old walls and gates; its winding, narrow streets; its houses, white-washed, or coloured red or green; the craft which frequent its harbour, and the picturesque dresses of the peasants, are delightful to the artist, as well as to the ordinary observer. The country in the vicinity is exceedingly rich, and fruits, corn, wine, and oil abound. The trade of the port—which is also a harbour of refuge—is increasing. About 2500 vessels, of 300,000 tons, entered and cleared the port. Pop. 8500.

The Bay of Vigo has an inland sweep of 20 miles, and is 5 miles wide at its mouth. The town has frequently been attacked by the English: by Drake in 1585 and 1589; by the Duke of Ormond, Rooke, and Stanhope in 1702; and in 1719 by Lord Cobham.

VIHÂRA (which, in Sanscrit, means, 'walking for pleasure or amusement') is, with the Buddhists (q. v.), the name of their temples and convents. Originally, it designated the hall or halls where the Buddha S'âkyamuni, and the priests by whom he was accompanied, used to meet; but when these halls gradually were converted into temples, the name of *Vihâra* was applied to them; and when, in time, the temples became the centre of a number of habitations in which the priests belonging to the temples resided, the whole monastic establishment was comprised under the same name. Properly, therefore, the Vihâra merely designates the Buddhistic temple, and it is generally used in this restricted sense. Such Vihâras are in Ceylon permanent structures, the walls being plastered, and the roof covered with tiles, even when the dwellings of the priests are mean and temporary. Near the entrance are frequently seen figures in relievo, representing the guardian deity of the temple. Surrounding the sanctum there is usually a narrow room, in which are images and paintings; and opposite the door of entrance there is another door, protected by a screen; and when this is withdrawn, an image of Buddha is seen, which occupies nearly the whole of the apartment, with a table or altar before it, upon which flowers are placed. The walls of the Vihâra are covered with paintings, and its stories generally illustrate some legend of Buddha's life. Some Vihâras are built upon rocks; others, and amongst these the most celebrated, are caves, in part natural, with excavations carried further into the rock. The Cave-temple at Dambulla is one of the most perfect Vihâras in Ceylon (see the description of it by Forbes in the *Ceylon Almanac*, 1834). On the continent of India, the finest specimens are those at Ajunta, Ellora, Salsette, and Junir. Sometimes no land is attached to the Vihâras, but sometimes also they are rich in lands; and in the case of one of the Vihâras in Kandy, there is an area belonging to it, which, under the native government, was regarded as a sanctuary for malefactors.—See R. Spence Hardy *Eastern Monachism*, and the authorities quoted there (London, 1850).

VI'KING (plural VIKINGR), a name given to the piratical Northmen who infested the coasts of the British Islands and of France in the 8th, 9th, and 10th centuries. This word is quite unconnected with 'king,' being derived from the Scandinavian *vik*, a bay; and this class of marauders were s called because their ships put off, not like the king' ships, from the lawful harbour, but from the bay See NORMANS.

VILKOMI'R, a town of West Russia, in the government of Kovno, on the Swenta, 130 miles south-east of Riga. It was a flourishing town in the 13th c., and continued prosperous till the 17th c., when it began to decline, in consequence of the wars with Sweden, Russia (V. being at that time a Polish town), and the Cossacks. The town contains an ancient church of the 13th century. Flax is exported to Riga; but the trade is not extensive. Pop. 7480.

VI'LLA, a term now applied to detached suburban residences with about one acre or less of ground attached to them. In the time of the Romans, the villa was a cluster of buildings in the country, forming a sort of private town, and containing in one the residences of the proprietor, farmer, and servants, and all the necessary offices and other accommodation for the cattle—the gardens, pleasure-grounds, &c. These villas were sometimes of enormous size, but they do not seem to have been built on any regular architectural plan, so as to produce an effect commensurate with their extent. The villa was divided into several parts, according to their uses: 1. The *Villa Urbana* was the portion in which the proprietor resided, and was laid out, as the name indicates, in a manner very similar to that of a town-house. The size and style of this part depended, of course, on the pleasure or quality of the master. It contained the eating-rooms, bed-chambers, baths, covered porticos, walks, and terraces. 2. The *Villa Rustica* was the portion set apart for the stabling, servants, &c., and the accommodation for the cattle. Its extent depended on the size of the farm and number of cattle. 3. The *Villa Fructuaria* was for the wine, oil, and other produce. The number of servants accommodated in a villa was very great. The livery-servants, along with the gardeners for the pleasure-grounds, comedians, musicians, &c., belonged to the Villa Urbana. The *Villicus* presided over the others, including the servants for tilling the land, the herdsmen, shepherds, goatherds, swineherds, poulterers, &c. There were also frequently several artisans, kept constantly on the premises, such as smiths, carpenters, &c.

VILLA or SANTA MARIA DEL PRINCIPE. See PUERTO PRINCIPE.

VILLAFRA'NCA, a small town of Northern Italy, in the province of Verona, and 9 miles south-west of the city of that name, on the left bank of the Tartaro. It was formerly a place of great strength; but it is now notable chiefly as the place where the treaty of peace between the emperors of France and Austria, which brought the Italian war of 1859 to a close, was signed June 11th of that year. Pop. (including the surrounding hamlets) 7500.

VILLAFRA'NCA DE PANA'DES (of the Bakers), a dull, backward town of Spain, in the province of Tarragona, in Cataluña, about 30 miles west-south-west of Barcelona. It contains some very early palaces of the kings of Aragon, not, however, of much interest. Pop. about 5500. V., founded

by Amilcar, was the earliest Carthaginian settlement in Cataluña.

VI'LLA-REA'L, a town of Valencia, Spain, in the province of Castellon, and 5 miles south of the city of that name, about 3 miles distant from the Mediterranean shore. It has wide, straight streets, laid out at right angles to one another, and contains flour and oil mills, woollen factories, and brandy distilleries. Pop. 7750.

VI'LLA RI'CA, a city of Brazil, capital of the province of Minas Geraes, called also Ouro Preto (q. v.).

VILLARS, Charles-Louis-Hector, Duc de, Marshal of France, one of the most illustrious of the great captains of Louis XIV.'s time, was born at Moulins, in the dep. of Allier, 8th May 1653. Being of a noble family, his education, with a view to the military profession, was prosecuted at the college of Juilly, and he subsequently volunteered into the army which was employed in Holland; and having attracted Louis XIV.'s attention by his daring courage and striking elegance of figure, obtained a troop of horse in 1672, served for two years under Turenne in Germany, and after the battle of Seneffe, received a regiment of cavalry, when yet in his 21st year. After a further term of service under Luxembourg and Crequi, he returned to Paris with the reputation of being one of the most promising young officers of the time. During the next ten years (1678—1688), he was employed in diplomatic service, chiefly at the court of Bavaria. In 1688, Louvois appointed him commissary-general of cavalry; and in the war which immediately followed the league of Augsburg, placed him at the head of the cavalry in Flanders. He was subsequently distinguished in the campaigns on the Rhine and in Italy. From 1699 till 1701, he represented France at the court of Vienna, and watched with sleepless vigilance the tortuous policy of the Austrian ministers, foiling by his penetration their most promising schemes, till he came to be regarded personally with extreme dislike, was shunned by all the court (Prince Eugene excepted), and even his life threatened. On his return, he was employed in Italy under Villeroi; and after a brief period of service under Catinat, was for the first time (1702) raised to independent command, when he was sent to succour the Elector of Bavaria, who had taken up arms on the side of France. Towards the close of 1702, V. crossed the Rhine, defeated the Markgraf of Baden at Friedlingen, took Treves, Traerbach, and Nancy; and early in the following year, again crossed the Rhine, traversed the almost impassable defiles of the Black Forest, and debouching from the mountains at Villingen, joined the Elector near Dutlingen, on the 12th of May. His bold and well-conceived scheme for carrying the war into the enemy's country, by advancing upon Vienna, while so many Austrian troops were employed on the middle Rhine, in Italy, and against Ragotski in Hungary, was foiled by the stupid obstinacy of his colleague, the Elector; and after his skill and genius had been tasked to the utmost to keep the Austro-Germans under the Markgraf of Baden and Stirum at bay, and he had been relieved by the return of his ally (who had been soundly beaten by the Tyrolese mountaineers), he reopened his line of communication westward, and leaving Marsin in command, returned in disgust to France. He was next commissioned to put down the insurrection of the Camisards (q. v.), which had been zealously fostered, for strategic reasons, by English and Dutch agents. V.'s manly moderation and soldierly frankness fairly won over Cavalier, the ablest of the insurgent leaders; and might, with his consummate military skill, have suppressed the insurrection. However he was not allowed to manage matters for himself, and all he could do was to reduce the ferment to insignificant proportions. V. was then sent to watch over the north-eastern frontier, and took post on the heights of Fronsberg, when Marlborough advanced upon him with 110,000 men; but V. had shewn such skill and strategy in the selection and fortification of his position, and such wise self-control in remaining strictly on the defensive, that the great English hero declined to risk an attack, and retreated; upon which V. burst into Alsace, captured the enemies' reserves of supplies and artillery, and advanced to Rastadt and Stuttgart. The withdrawal of some of his troops to reinforce the north French army forced him to recross the Rhine; yet, with his small army, he, in 1708, completely foiled all the attempts of Prince Eugene to penetrate into France. In 1709, he was sent to oppose Marlborough in the north; but unfortunately, at the commencement of the battle of Malplaquet (q. v.), he was severely wounded, carried off the field insensible, and rendered unfit for service till the following year; and the reopening of his wound in the autumn of 1710 forced him again to resign the command. But in 1711, he returned to his post, headed the last army France could raise, and with it fell upon the British and Dutch under Albemarle, who were intrenched at Denain (24th July 1712), carried their intrenchments sword in hand, and captured the most of them; he then turned upon Prince Eugene, and drove him under the walls of Brussels. This magnificent series of successes saved the national honour, and even life, of France, and brought about the peace of Rastadt (see Utrecht), which V. signed as plenipotentiary, 6th May 1714. After the peace he became, at court, the principal adviser on military affairs and on questions of foreign policy; was a strong opponent of Law's financial measures; but through the intrigues of Fleury, lost favour at court. The outbreak of war in 1732, however, brought out the old hero from his retirement, and with the title of 'Marshal-general of the Camps and Armies of France' he went to head the French army in the Milanese. The campaigns of 1733—1734 shewed that the weight of years had left V.'s military genius and spirit untouched; but the ill-behaviour of his ally, the king of Sardinia, determined him to solicit his recall; and he accordingly set out for France; but falling ill at Turin, he died there, 17th June 1734. V. was the last of the great military geniuses of the French monarchy, and was wholly free from the restless anxiety for *éclat* which detracts from the merits of so many of them. As a general, he possessed in a high degree rapidity of apprehension, skill in disposition, and promptitude (without precipitancy or rashness) in action. Humanity and sincerity, joined to thorough self-reliance, may be traced through the whole of his long and eventful life; and the two latter qualities occasionally exhibited themselves so prominently at court as to cause the 'professional courtiers' of Louis XIV. to look askance upon him as a 'rude and *immodest*' person. His Memoirs have been printed in Holland, and his Autobiography by Anquetil.

VILLA'RSIA, a genus of plants of the natural order *Gentianaceæ*, the species of which are widely distributed over the world, and are either aquatic or marsh plants, with entire leaves and yellow flowers. V. *nymphæoides* is a native of England, but rare. It is more common in many parts of Europe, from Denmark to the Mediterranean, and is very abundant in Holland, often covering large tracts of the canals with its beautiful flowers and

leaves. It abounds in the south of Siberia. It is easily cultivated.

VILLEFRANCHE, a town of France, in the dep. of Aveyron, is seated on the river of that name, in a valley surrounded by hills, 85 miles north-east of Toulouse by railway. It contains many interesting houses of the 15th and 16th centuries, and, in the market-place, a large collegiate church, in the pointed Gothic style of that period, and carries on important manufactures of copper wares, of gray cloths, and packing. Ironworks and foundries are in operation. Pop. about 15,000.

VILLEFRANCHE-SUR-SAÔNE, a small, industrious town of France, in the dep. of Rhone, stands on the Morgon, an affluent of the Saône, 18 miles north of Lyon, on the Paris and Marseille Railway. It is surrounded by a district studded with charming country-seats, and consists chiefly of a handsome street a mile and a quarter in length. Manufactures of cotton goods are carried on, and there is a great trade in wines, horses, cattle, hides, and cloth. Pop. about 12,000.

VILLEIN. See SERF.

VILLEMAIN, ABEL FRANÇOIS, a distinguished French scholar and writer, was born at Paris, June 11, 1790, and educated at the Lycée Impérial (now the Lycée Louis-le-Grand). In 1810, he was appointed Extraordinary Professor of Rhetoric at the Lycée Charlemagne; and shortly after, Maître de Conférences de Littérature Française et de Versification Latine, at the Ecole Normale. During the years 1812—1816, three of his literary essays were crowned by the French Academy—the *Eloge de Montaigne*, *Avantages et Inconvénients de la Critique*, and *Eloge de Montesquieu*. In 1816, he was appointed to a chair of Modern History at the Sorbonne, as assistant to Guizot; but in the course of the same year, was transferred by Royer-Collard to the chair of Eloquence, which he held till 1826. In 1819, he published, in 2 vols., his *Histoire de Cromwell d'après les Mémoires du Temps et les Recueils Parlementaires*—a work written in a calm, liberal, and wise spirit. Louis XVIII. took notice of the author, and V. was induced to enter on a political career. The post assigned to him was rather a delicate one, that of Chef de l'Imprimerie et de la Librairie. Under the ministry of M. Decazes, he also held the office of Maître des Requêtes to the Council of State, and in 1820 was decorated with the Legion of Honour. Two years later, appeared his translation (with preliminary essay and notes) of the *Republic* of Cicero; and in 1825, a drama entitled *Lascaris, ou les Grecs du XV. Siècle*, and an *Essai sur l'Etat des Grecs depuis la Conquête Musulmane.* In 1827, having gradually passed over to the ranks of the liberal opposition, he was charged, along with Lacretelle and Chateaubriand, to draw up the petition addressed by the French Academy to Charles X. against the re-establishment of the censorship of the press! The result of this hardihood was the loss of his appointment as Maître des Requêtes, and in consequence, a vast increase of his popularity as a lecturer at the Sorbonne. In the beginning of 1830, he was sent to the Chamber of Deputies by the electoral college of Evreux, took his seat among the liberal party, signed the famous address of the 221, and was altogether very prominent and active in those movements which brought about the constitutional monarchy of Louis Philippe. But he was too sober, unsympathetic, philosophical a politician, too much a *Doctrinaire* of the Guizot school, to be a favourite with the excitable masses, and he only sat in the Chamber for one year. In 1831, the king named him member of the Royal Council of Public Instruction, of which he became Vice-president in 1832. The same year witnessed his elevation to the peerage. V. held the portfolio of Public Instruction in the ministries of Soult (1839—1840) and Guizot (1840—1844); but his health failed under the immense labours of his department, and the impossibility of pleasing so many different parties—the Church, the University, the Reds, the Liberals, the Doctrinaires, and the king himself; and in consequence, he found it necessary to resign. Subsequently V. wisely devoted himself to literature alone. His principal works are: *Cours de Littérature Française, Tableau du XVIII. Siècle, Discours et Mélanges Littéraires* (1823), *Nouveaux Mélanges Historiques et Littéraires* (1827), *Etudes de Littérature Ancienne et Etrangère* (1846), *Tableau de l'Eloquence Chrétienne au IV. Siècle* (2d ed. 1849), *Etudes d'Histoire Moderne* (1846), *Souvenirs Contemporains d'Histoire et de Littérature* (1856), *Choix d'Etudes sur la Littérature Contemporaine* (1857), *La Tribune Contemporaine, M. de Chateaubriand* (1857), *Essais sur le Génie de Pindare et sur la Poésie Lyrique* (1859); besides a vast number of Essais, Etudes, Discours, Notices, and Rapports, addressed to the French Academy, of which he was perpetual Secretary from 1832 until his death. V. was one of the most accomplished writers of his time. He died in 1870.

VILLE'NA, a town of Spain, in the modern province of Alicante, and 37 miles north-west of the city of that name by railway. The streets are narrow and winding, and are overlooked by an old castle, which has an imposing appearance, owing chiefly to its elevated position. Around the town, the hills are clad with vines, and the country is fertile. A great fair, at which goods are sold to the value of £120,000, takes place here every autumn. Pop. 8224.

VILLENEUVE D'AGEN, or **VILLENEUVE-SUR-LOT**, a town of France, in the dep. of Lot-et-Garonne, in a charming valley, 15 miles north of the town of Agen. The river Lot divides it into two unequal parts, which communicate by a remarkably bold bridge of a single arch. The town, formerly called Gajac, was completely destroyed in the wars of the commencement of the 13th century. It was afterwards rebuilt, and then took its present name. A great trade is carried on in wines, prunes, cattle, and iron; there are manufactures of paper, cloth, table-linen, and copper-wares. Pop. 15,000.

VILLENEUVE, PIERRE-CHARLES-JEAN-BAPTISTE-SYLVESTRE DE, Vice-admiral of France, descended from an ancient and noble family, which has supplied an almost uninterrupted succession of distinguished ornaments to their country, was born at Valensoles, in the dep. of Basses-Alpes, December 31, 1763, entered the navy in his 15th year, and passed as captain in 1793. In 1796, he was raised to the rank of 'captain of division' (equivalent to *commodore* in the British navy), commanded the rear-division at the battle of the Nile, and after that disastrous fight, succeeded in carrying off to Malta his own vessel, the *Guillaume Tell*, and four others. In 1804, he was nominated vice-admiral; and in the following year, was appointed to the command of the Toulon squadron, with which he succeeded in reaching Cadiz, where he was joined by the Spanish fleet under Gravina. His orders being to attempt the withdrawal of the British fleet from the coasts of Europe, he bore away westwards across the Atlantic, reaching the Antilles on 14th May, and there making a number of valuable captures. A month afterwards, hearing that the British fleet had reached Barbadoes, he at once re-embarked his troops, and returned to Europe, pursued by Nelson. On

reaching the Azores, however, he encountered a British squadron, under Sir Robert Calder, and a fierce combat ensued, which lasted till dark. On the following morning, neither side cared to renew the engagement (for which V. was abused by *Le Moniteur*, and Admiral Calder was put on trial), and V., unable to reach Brest, again returned to Cadiz, where he was strictly blockaded by Nelson. The unjust severity with which he was treated by Napoleon arose from the fact, that the battle off the Azores, and the subsequent blockade of the French and Spanish fleet in Cadiz, had completely ruined Napoleon's scheme for the invasion of England; and the further indignity of being superseded, hurried the unfortunate V. into the desperate resolve of engaging Nelson before his successor could arrive at Cadiz. Besides, by a stratagem of Nelson, he was led to believe that the strength of his enemy was such as to afford him a favourable opportunity of wiping out the disgrace of his former failures, and he accordingly, in superior force, sallied out of the harbour, and engaged in the memorable conflict of Trafalgar (see TRAFALGAR, and NELSON). A passage in the instructions issued to his captains on October 20, sufficiently shews the irritated state of his feelings—'Every captain who is not under fire is not at his post, and a signal of recall will be a brand of dishonour to him.' V., whose vessel, the *Bucentaure*, was completely dismasted, was forced to strike his flag, and was made prisoner, and conveyed to England, whence he returned to France in April 1806. Instead of rendering himself at Paris, he stopped at Rennes, with the view of ascertaining the kind of reception he was likely to meet with from the emperor. The result of his inquiries was unfavourable; and on the morning of April 22, he was found dead in bed, with six knife-wounds in his heart. He had died by his own hand.

VI'LNO (often written VILNA), a government of West Russia, bounded on the W. by Poland, from which it is separated by the Niemen; and on the E. by the government of Vitebsk, from which it is separated by the Western Dwina, and by that of Minsk. Area, 16,320 sq. m.; pop. 899,993, mostly Lithuanians, Slavonians, Jews, and Tartars. Only 18 per cent. of the whole pop. are Poles. The rivers are the Vilia, Beresina, affluents of the Niemen, and the Disna, which flows north into the Dwina. The surface is flat; the highest part being only 1100 feet above sea-level. The soil, in some places very fertile, consists for the most part of clay and sand. Marshes abound, and there are 400 small lakes. The woods which cover the marshes are the great source of the wealth of the government. The principal trees are fir and pine, and the timber is floated down the Niemen and Dwina for export, and used in the interior for shipbuilding, &c. The climate is mild. There are a good many manufactories in the government; but agriculture is the principal occupation of the inhabitants, and fairs are numerous and important.

VILNO, an important city of West Russia, capital of the province of the same name, picturesquely situated on the Vilia, 473 miles south-west of St Petersburg. Besides its cathedral, it is remarkable for the number of its religious edifices, among which are a mosque, several synagogues, and Lutheran meeting-houses. It formerly contained a university, founded in 1576, but abolished in 1832. Among existing institutions, the chief are the observatory, medical society, museum of antiquities, and theatre. The principal articles of trade are timber and corn. Manufactures are not important. Pop. (1867) 79,265.

In 1323, Gedimin, Grand Duke of Lithuania, transferred his capital from Troki to Vilno. In 1795, after the final annexation of Lithuania to Russia, V. was made the chief town of the government of the same name.

VINAGO, a genus of *Columbidæ*, the most marked section of that family, having a comparatively stout solid bill, laterally compressed; with a hard, hooked, and inflated tip; the tarsi short, the feet large, and formed for perching or grasping. The species, of which not many are known, are natives of the tropical parts of Asia and Africa. They inhabit forests, and are shy and timid birds.

VI'NCA. See PERIWINKLE.

VINCENNES, a commune and market-town of France, in the dep. of Seine, five miles east-south-east of the Louvre in Paris. In reality, the town is merely a great fortress and barracks, and is famous for its arsenal, and for its school for the practice of shooting. At the latter, the Chasseurs de Vincennes, and all the best marksmen of the army, are trained. Pop. (of commune) 17,064.

V. owes its historical importance to its castle and park. The château, the main object of interest in the town, is rectangular in shape, and dates from the middle of the 14th century. It was surrounded by nine towers, which were in existence down to the year 1808, but of which only one, known as the Donjon de Vincennes, 170 feet high, and with walls 17 feet thick, remains. The original building dates from the reign of Louis VII., and had its origin in a hunting-lodge, erected here by that sovereign in 1137. Philippe-Auguste enlarged it, and stocked its woods with wild animals, sent to him by the king of England. Here Queen Jeanne (wife of Philippe le Bel), Louis le Hutin, and Charles le Bel, ended their days. Philippe de Valois caused the old mansion to be demolished, and laid the foundations of the more modern château, which, from the middle of the 14th c. till the time of Louis XV., was a royal residence, and the birthplace and place of death of many princely personages. After this time, it was used as a prison, and among the famous men who have languished within its donjon, may be mentioned Henry IV., the Prince of Condé, Cardinal de Retz, Mirabeau—who here wrote his translation of Tibullus—and the Duc d'Enghien, who was shot in the moat of the castle by order of Bonaparte. There are extensive barracks, known as the New Fort, built 1848—1852, and a Salle d'Armes, with a large collection of all sorts of weapons. In the centre of the Bois de Vincennes, a large tract has been cleared as an exercise-ground for troops, and for rifle and artillery practice. Other parts of the Bois, which presents much fine scenery, have been embellished with artificial sheets of water, rivulets, and agreeable walks.

VINCENNES, a city of Indiana, U. S., America, on the left bank of the river Wabash, on the Ohio and Mississippi, and Evansville and Crawfordsville Railways, 110 miles south-west of Indianapolis. It is the entrepôt of a rich agricultural country, has a well-endowed university, Roman Catholic bishopric, seminary, and academy, two semi-weekly and three weekly newspapers, and considerable manufactures. A French trading-post was established here in 1710, and a colony in 1735, which lived peacefully with the Indians. Until 1813, it was the capital of the North-west Territory. Pop. (1870) 5440; (1880) 7680.

VI'NCENT, ST, a British island of the West Indies, belongs to the Windward Group, and lies about 28 miles south of St Lucia, and 100 miles west of Barbadoes. Lat. 13° 10′ N., long. 61° 5′ W. It is 18¼ miles long, 11 miles broad, has an area of 131 sq. m., and contained (in 1871) 35,688 inhabitants, of whom a few were white, about one-fifth

coloured, and the rest black. A chain of bold and high mountains traverses the island from north to south, and throws out lateral branches, between which are ravines, which widen into open valleys as they approach the seashore. Evidences of volcanic action are everywhere visible on the island—strata are upheaved and disturbed, and huge masses of rock have been displaced. In the interior is a volcanic mountain, 3000 feet high, and the crater of which is half a mile in diameter. The climate is hot, the temperature ranging from 75° to 87°. The annual rainfall is about 76 inches. No valuable minerals have as yet been discovered. The chief products are sugar, arrowroot, rum, cotton, and molasses; and the value of the exports for 1868 was £195,551—that of the imports, chiefly linen, cotton, and woollen manufactures, manures, flour and wheat, fish dried or salted, pork salted or cured, hardware and cutlery, leather and leather manufactures, timber, butter, and mules, £71,396. Near 700 vessels, of about 35,000 tons, enter and clear the ports of St V. annually. Religion and morality are at a low ebb—more than half the children are reported as illegitimate. There are about 30 schools, attended by 2000 or more children. The revenue, derived chiefly from export duties, was (in 1868) £25,204; the expenditure, £21,727, of which £1216 was employed in the repair, &c. of roads. The government consists of a lieutenant-governor, a legislative council, and 12 elective members of Assembly. The capital is Kingston (q. v.), and the other one or two small towns or villages are of little note. In 1861, the importation of coolies from India was commenced, 500 of them having been brought to the island in that year. Shocks of earthquake are frequent; hurricanes occur at intervals, and the violent rains occasionally damage the crops and roads.

VINCE'NTIAN CONGREGATION, so called from its founder, the Roman Catholic saint, Vincent de Paul, is an association of secular priests, who, although not in the strict sense a religious order, are bound by vows, and are especially devoted to the duty of preaching and hearing confessions among the people, particularly the poor. Another object of the V. C. is to undertake the direction of episcopal seminaries and other colleges for the education of ecclesiastics, as also to direct the annual devotional exercises of the secular clergy, called Ecclesiastical Retreat. See Paul, Vincent de. At the latest recorded enumeration which has come under our notice, the Congregation numbered above 700 members, in France, Italy, Poland, the Levant, and Algeria. The members are numerous also in America, and branches exist in Ireland and Scotland. The name Vincentian is sometimes given also to the Sisterhoods (of which there are several, and of which that of Charity is the most remarkable), which were founded by Vincent de Paul, and even to the Charitable Lay Association, better known as the Society of St Vincent de Paul, which has extensive ramifications in almost all the countries in communion with the church of Rome, and which has been the occasion of certain recent restrictive measures in France. See Brothers and Sisters of Charity; Paul, Vincent de.

VI'NDHYA MOUNTAINS. See India.

VINE, a term sometimes used to designate any climbing plant, especially if shrubby, but also more particularly applied to the species of the genus *Vitis*, of the natural order *Vitaceæ*. This genus has *pentamerous* flowers (5-toothed calyx, 5 petals, 5 stamens), and has the petals united into a kind of hood and deciduous. The most important species is the Grape Vine (*V. vinifera*), from the fruit of which wine and raisins are made. The name grape is from the French *grappe*, a bunch of grapes, from the same root as *gripe* or *grab*, to grasp.

The grape vine has large, angular, lobed, toothed, and more or less hairy leaves. The stems are numerous and branching, very long, and of rapid growth, with many tumid joints, the outer bark readily splitting and peeling off, the woody tissue abounding with vessels of large size, from which, at the seasons of active vegetation, if the branch is

Vine (*Vitis vinifera*), shewing the flowers and their parts, the leaves, and the fruit.

wounded or cut across, the sap pours in prodigious quantity. The fruit-stalks, which are much branched, are opposite to the upper leaves, or in their stead are tendrils. The flowers are small, greenish white, and fragrant. The fruit is a round or oval berry, 2-celled and 4-seeded, varying much in size and colour—in the small Corinth or Currant Grape, about ¼th of an inch in diameter; in the largest varieties, more than half an inch; green, yellow, red, purple, and sometimes variegated; but the colour is entirely in the outer skin, the juice being always colourless; and whilst the pulp of the grape is wholesome, nutritious, and gently laxative, the skin is astringent and indigestible. Some of the ovules are often abortive, or even all of them in the fruit of old vines of some varieties, as in the seedless Ascalon or Sultana raisins.

The vine attains a large size, the stem being sometimes 18 inches in diameter, so that the wood, which is very hard and durable, has been employed for making furniture, statues, &c. It attains also a very great age, continuing fruitful for at least three or four hundred years.

The grape is one of the most valuable of fruits, not only because of its use in the manufacture of wine, and as the source also from which brandy, vinegar, and tartaric acid are obtained, but because, both in a fresh and dried state, it forms not a mere article of luxury, but a great part of the food of the inhabitants of some countries. Dried grapes, under the names of *raisins* and *currants*, are a considerable article of commerce. Fresh grapes are commonly eaten with bread in Syria, and some other countries in which they abound. The usefulness of the grape is increased by its keeping fresh for many weeks in a cool airy place. Some varieties are more easily kept than others. More than 1500 varieties are described in works on the culture of the grape; and this subject, under the name *Ampelography* (Gr. *ampelos*, a vine), has been

elevated by some recent German writers almost to the rank of a distinct branch of science. The quality of the grape is extremely liable to be affected by circumstances of soil and climate, and this is particularly to be observed in the wine produced from it, the difference between the produce of two vineyards in the same neighbourhood being often very remarkable.

The vine dislikes a damp soil, but will thrive in almost any open soil with good drainage. In rich deep soils, it grows luxuriantly, and produces abundance of large fruit; but on shallow, dry soils, the fruit, though less abundant, is of finer flavour. The vineyards most celebrated for the excellence of their wines are not generally of rich soil. The steep slopes of hills are often planted with the vine, and are sometimes terraced for this purpose; and nothing can be more suitable to situations where patches of good soil are mingled with bare rocks, nor anything more beautiful than the rocks covered with luxuriant foliage and rich fruit. This mode of cultivation on steep rocky slopes was anciently very prevalent in Judæa.

It is doubted of what country the grape-vine is a native, nor is it known at what time, certainly very remote, its cultivation was first introduced into the south of Europe. It is now found wild in some parts of Europe, but is rather naturalised than truly native. It seems probable that it is indigenous in the hilly countries on the south of the Caspian Sea, where it is very abundant and luxuriant, climbing to the tops of the loftiest trees, and producing large bunches of delicious fruit. But it is doubted if *Vitis Indica*, a native of the north of India, abounding in some parts of the Himalaya, is really a different species. The wild grapes of these mountains are round and purple, and very agreeable. It is doubted also by some if any of the wild grapes of America are really distinct; some of which, however, are much more different in their characters and qualities from the common form of the cultivated plant. Of these American grapes, the FOX GRAPE (*V. Labrusca*) is the most similar to the cultivated grape. It is common throughout great part of Eastern North America, and is found as far north as Quebec. The berries are large, deep blue, varying to red and white, with thick skin and tough pulp, and have been found capable of much improvement by cultivation. The CHICKEN GRAPE (*V. æstivalis*), not found north of lat 42°, has smaller and more agreeable berries. The *V. cordifolia*, a frost grape, ripening after frosts.—The BULLACE GRAPE (*V. rotundifolia*), found only as far north as lat. 39°, has larger grapes than any other American species, and of agreeable flavour.—There is also a species of a very foxy aroma (*V. vulpina*), the MUSCADINE or SOUTHERN FOX GRAPE, from which Prof. Gray derives the *Catawba* and *Scuppernong* varieties. But the habit and leaves of all these differ very little from those of the common vine. From the several species, the numerous excellent varieties in cultivation have been derived. A variety known as *V. riparia*, often found on gravelly banks of rivers, has exquisitely fragrant flowers. The WATER WITHE of Jamaica, so called from the great quantity of sap which its shoots pour out when cut (*V. Caribbæa*), does not differ in very marked botanical characters; although its small black berries, which it produces in immense quantity, are acid and austere.

The cultivation of the grape and the making of wine are of the most remote antiquity, as appears from the Scripture history of Noah, and from many passages of the most ancient authors. The mythological fable of the marches of Bacchus relates to the extension of the culture of the vine from Asia into Europe. The earliest accounts we have of the manner of cultivating the vine are by the Roman authors Virgil and Columella. The vine was probably introduced into the south of France as early as into Italy; it is said to have been brought to Marseille by the Phocæans, about 600 B.C., and its cultivation was early co-extensive with civilisation in all the countries near the Mediterranean. In Italy, so much of the land was occupied by vineyards, that the Emperor Domitian, fearing a scarcity of corn, issued a restrictive or prohibitory edict, 81 A.D., which was afterwards long continued in force, through fear that the abundance of fine wine might tempt the barbarians of the north to invade the country. The vine was introduced into the south of Germany about the 3d C. B.C. Augustus preferred the Rhætian wine to all other. The first vineyards on the Rhine and Moselle were planted by the Emperor Probus in 281 A.D Under the Merovingians, the culture of the vine extended greatly both in France and Germany. Charlemagne derived a very considerable revenue from the vineyards even of the northern parts of his empire. The Huns who remained in a number of settlements on the Rhine after the expedition of Attila into Gaul, 451 A.D., brought thither the arts of cultivating the grape and of making wine from Pannonia; and Hunnish grapes and Hunnish wine were long in particular repute. In the middle ages, the monks were the first to plant vineyards and to make wine in many parts of Europe.

The cultivation of the vine was introduced into England by the Romans. At the time of the Norman Conquest, there seem to have been vineyards in the south and south-west of England, and although they afterwards disappeared, successful attempts were occasionally made to re-establish them; and one at Arundel Castle in Sussex yielded, about the middle of last century, large quantities of wine. Of late years, the cultivation of the vine has much increased in the south of England, in gardens, on the walls of suburban villas and of cottages, but chiefly for the sake of the fresh fruit, although wine of pretty good quality is also made in small quantities for domestic use.

The vine does not, in ordinary seasons, ripen its fruit well in Great Britain further north than Yorkshire, although grapes have occasionally ripened in the open air in Scotland. It is, however, a hardy plant, in so far as the endurance of severe winter-frosts is concerned; but it requires for the ripening of its wood, as well as of its fruit, a considerable summer-heat continued for several months. Thus, it does not succeed in parts of Britain in which the mean temperature of the year is higher than that of countries where good wine is made. A very moist climate is also unsuitable to it; and therefore it is not extensively cultivated in the north-west of France, although there are many productive vineyards in the north-east. In the most northern regions to which its cultivation extends, the vine is protected in various ways during winter; in some places, by laying down its branches, and covering them with some depth of earth. It produces abundant fruit in warm climates, such as India, but the juice passes too rapidly into acetous fermentation to be used for making wine, although in many of the mountainous districts of India it might probably be cultivated for this purpose with success. Shiraz, in Persia, is one of the warmest climates celebrated for the production of good wine.

In Europe, the cultivation of the vine forms an important branch of rural economy as far north as Coblenz on the Rhine; but in some countries, particularly in Greece and the Ionian Islands, raisins form the chief part of the produce of the vineyards.

The cultivation of the vine was early introduced by the Spanish and Portuguese into the Azores, the Madeira and Canary Isles, and America. The first vines were carried to the Cape of Good Hope by the Dutch in 1650; but whilst the wines of Madeira and those of the limited district of Constantia at the Cape of Good Hope have long enjoyed a high celebrity, and those of Canary and Teneriffe have been imported in considerable quantities into Europe. The cultivation of American varieties of the vine is now prosecuted with success on a large scale in certain districts whose atmospheric conditions are favourable, especially near the great lakes, in Ohio and Michigan, and wines are now produced rivalling many of the finer European kinds. The foreign vine has long been grown in California, where its cultivation has recently attained vast dimensions, while its product is scarcely excelled in quality.

The cultivation of the vine varies much in different countries. Success seems chiefly to depend on a good sunny exposure, liberal but not coarse manuring, and constant attention. New varieties are raised from seed, but the ordinary modes of propagation are by layers and cuttings. Fine varieties are sometimes budded or grafted on less valuable ones. In the vineries of Britain, the vines are carefully trained, in various ways, so as most completely to cover the walls and trellises, and to turn the whole available space to the utmost account; whilst superfluous shoots are displaced by pruning, so that the strength of the plant may be directed to the fruit-bearing branches, and that there may be no undue luxuriance of foliage to prevent sufficient access of light and air. The luxuriant growth of the plant renders the frequent application of the pruning-knife necessary during summer. The fruit being produced on shoots of the current year, the pruning is managed with a view to the abundance of these shoots, the greater part of which, when they have served their purpose, are cut away, such only being left as are required for the extension of the space profitably occupied by the plant. The bunches of grapes are also generally thinned out with great care, in order that finer fruit may be produced. By such means, and the aid of artificial heat, grapes are produced equal to those of the most favoured climates, and the vine attains to a large size and a great age. The famous vine at Hampton Court has a stem more than a foot in circumference, one branch measuring 114 feet in length, and has produced in one season 2200 bunches of grapes, weighing on an average one pound each, or in all nearly a ton.

In the warmer countries in which the vine is cultivated, as in Italy, it is generally allowed to grow very freely, attaching itself to trees or espaliers; but in more northern regions, it is commonly much pruned down, so that, instead of luxuriance and beauty, the vineyards exhibit a stiff and formal regularity. In some places, the vines are attached to poles; in others, they are pruned so close and kept so low as merely to form bushes which require no support. This mode of cultivation is sometimes adopted also in comparatively warm climates, as in some of the vineyards of the south of France, and in those of Constantia, at the Cape of Good Hope.

Only a few of the varieties of grape cultivated in Britain are at all suitable for the open air. By a judicious selection of varieties, as well as by variously regulating the application of heat, the grape season in vineries is greatly prolonged.

Grapes are sent to market in Britain in large quantities from the numerous vineries; they are also imported from Portugal, Spain, France, and Holland, generally packed in sawdust, but the close packing and the sawdust are injurious to their flavour.

The *vine disease*, or *vine mildew* (*Oidium Tuckeri*), has of late years made great ravages both in the vineries of Britain and in the vineyards of many countries. See OIDIUM, in SUPPLEMENT.

The juice of ripe grapes contains a considerable quantity of *grape-sugar* (see SUGAR), small quantities of a glutinous substance, and of extractive, bitartrate of potash, tartrate of lime, a little malic acid, and other ingredients, suspended or dissolved in water. The rapidity with which it passes into a state of fermentation after being expressed from the fruit, is remarkable.

For the making of wine, the wine-trade, the qualities and uses of wine, the different kinds of wine, &c., see WINE. Concerning the other commercial products of the grape, see BRANDY, VINEGAR, TARTARIC ACID, RAISINS, and CURRANTS.

VINEGAR is that form of ACETIC ACID (q. v.) which is generally preferred for culinary purposes, and which is made by the fermentation of vegetable substances. In Great Britain, it is manufactured on a large scale by the fermentation of malt; on the continent of Europe, it is as largely made from low wines which have turned sour. Malt, or British vinegar, as it is sometimes called, is made by brewing a weak wort from malt exactly as for Beer (q. v.). To 100 gallons of this, at a temperature of 70°, are added 4 gallons of yeast, and well stirred through for 8 or 10 minutes. This mixture is then allowed to ferment actively for two days, and is then transferred to the stoving-room; here it is distributed into a number of tubs, which, when filled, are covered over with coarse canvas. This room is dark, and is heated by stoves, and the heat is constantly sustained for weeks until the conversion of the wort into vinegar is complete. Other processes are used by different manufacturers for the purpose of producing it quicker; but the minute descriptions necessary to render them clear would be out of place here. Much vinegar is also made of beer which has become sour; it is, however, very inferior in quality, and wants the agreeable flavour of malt vinegar prepared by the above process, which is due to the presence of acetic and other ethers.

The greatest manufacture of *wine vinegar* in Europe is at Orleans, in France. Here the wines are sent from all parts when unfit for drinking, and are converted into vinegar. In the manufacture, a large number of casks are used, with

Section of Cask of Vinegar.

openings into each of only two inches diameter. Into each one are poured 100 pints of vinegar boiling hot; and to this, after eight days, are added 10 pints

of sour wine, and this is repeated every 8 days until the cask is full; another 15 days completes the process, and the vinegar is ready for use. Beech-shavings are much used in vinegar-making, as they are found to assist in clarifying the liquor by attracting the lees, which settle upon them, and leave the liquor clear, in which state it acetifies more rapidly.

'According to Ure, a good vinegar may be prepared by adding to each gallon of a syrup composed of 1¼ lb. of sugar and 1 gallon of water, a quarter of a pint of yeast. If kept for three days at a temperature of 75° or 80°, it will be sufficiently acidified to allow of being drawn off into the refining-cask, where one ounce of bruised raisins and one ounce of crude tartar are to be added to each gallon of liquor. When the sweet taste has quite disappeared, it should be drawn off into bottles, and corked down tightly. It is stated that such vinegar will contain 5 per cent. of pure acetic acid.'—Miller's *Organic Chemistry*, 2d ed. p. 339. Vinegar prepared by these methods contains a large amount of foreign matters, which can be got rid of by simple distillation; the acid liquid which comes over constituting what is known in pharmacy as *distilled vinegar*. What is sold commercially as distilled vinegar is simply acetic acid distilled from wood (see PYROLIGNEOUS ACID), and diluted with five times its volume of water. This constitutes also the vinegar used by pickle-manufacturers; it is quite as wholesome as common vinegar, but wants its agreeable flavour; its preservative powers are, however, much greater, and its price very much less, if fairly charged. Vinegar containing 5 per cent. of the pure acid is the strongest that is ever produced, and is termed *proof vinegar*. There are four kinds manufactured, which are known in trade by the numbers 18, 20, 22, and 24, the last being the best quality. The strength of any specimen is best ascertained by determining the quantity of anhydrous carbonate of soda which a given weight of it will neutralise, it being recollected that 100 grains of carbonate of soda correspond to 96·2 grains of anhydrous acid. The ammonia test, according to Neligan, serves to distinguish French from English vinegar: with the former, the colour is purplish; with the latter, there is either no change, or it is brownish. There is generally a slight turbidity, which is due to a trace of lime.

As a condiment, vinegar is an ingredient of a large number of sauces, and of all ketchups and pickles; and although it cannot be regarded as an essential article of food, its applications in cookery are numberless. Young ladies, with an undue tendency to corpulency, sometimes drink vinegar freely with the view of improving the figure; but as vinegar only causes thinness by injuring the digestion, it is obviously not worth while that they should run the risk of exchanging slight fulness of habit for chronic dyspepsia.

Vinegar is used in medicine as a cooling astringent, and may be employed with much benefit if taken freely, when largely diluted with water, in hæmoptysis, in hæmatemesis, and in the colliquative sweating of hectic fever. Dr Neligan states that in severe hiccough, he has often seen benefit derived from a dose of a wine-glassful of vinegar. In cases of poisoning with the alkalies or their carbonates, it is one of the best antidotes. It may also be employed locally in various ways—as, for example, to check hæmorrhage from the nose, womb, &c. In intestinal hæmorrhage, an enema containing vinegar and cold water may be used with success, especially if the lower part of the intestine be the seat of the bleeding. Sponged in a diluted state (one part to three of cold or tepid water) over the neck, chest, &c., it affords great comfort and considerable relief in cases of colliquative sweating. In its character of a refrigerant rather than as an astringent, its local action on the skin is attended with much benefit in the treatment of most febrile and inflammatory diseases; it should be freely applied, as in colliquative sweats, to the surface of the body, face, and extremities; and thus employed, has a very tranquilising effect, and often induces sleep. The heat and pain commonly experienced in sprains are often relieved by the local application of brown paper soaked in diluted vinegar, and changed when the feeling of heat returns. It is an important addition to astringent gargles in cases of relaxed uvula and tonsils; and is the best application to the eyes in cases in which lime has got within the eyelids. The ordinary dose is from 2 to 4 drachms; and when taken as a drink, 3 ounces may be mixed with a pint and a half of water, and taken in the course of the day.

The term *Chili vinegar* is applied to a preparation obtained by infusing half an ounce of cayenne pepper in a quart of French vinegar for ten days, and straining. It is commonly added to gargles in the proportion of 1 ounce to 8 or 9 ounces of infusion of roses, in cases of relaxed sore throat.

Aromatic Vinegar, known also as *Vinegar of the Four Thieves*, *Marseille Vinegar*, and *Camphorated Acetic Acid*, consists of strong acetic acid, holding in solution camphor and the oils of cloves, lavender, rosemary, and lemons. It is very fragrant and volatile, and must be kept in well-stoppered bottles. It was formerly regarded as a valuable prophylactic of all infectious diseases, but is now only used as an external stimulant, the vapour being applied by a smelling-bottle to the nostrils in cases of fainting.

VINEGAR-PLANT (*Penicillium glaucum*), a fungus of the sub-order *Hyphomycetes*, but somewhat resembling those known by the name of MOULD (q. v.) It forms a flocculent mass or web, which is tough and crust-like or leathery, and when examined by the microscope, is seen to consist of a *mycelium* of branched threads, with the branches somewhat tangled, and the spores disposed in patches about the pencil-shaped ends of fertile threads. It is found on decaying bodies and in fluids undergoing the acetous fermentation, which it greatly promotes, and which, indeed, it very readily occasions, a small piece placed in sugar and water soon changing it into vinegar. Advantage is sometimes taken of this property for making vinegar.

VINET, ALEXANDRE-RODOLPHE, Swiss divine and author, was born at Lausanne, June 17, 1797, and received his education in his native city as a student of the Protestant Church, of which he was ordained a minister in 1819. From an early age, he shewed a passionate fondness for the study of French literature, which he cultivated with so much success, that at the age of 20 he was appointed Professor of French language and literature in the gymnasium of Basel. This position he held till 1837, when he removed to Lausanne, to fill the chair of Practical Theology in the Academy of that city, which chair, however, he resigned in 1840, when he seceded from the national church, on account of the new constitution imposed upon it in that year. Notwithstanding his resignation, he appears to have continued his lectures either in the Academy or privately; and in 1844 again connected himself with that institution as Substitute-professor of French Literature. V. took a leading part in the formation of a constitution for the Free Church of Vaud, formed by those who seceded from the national church in 1845, this secession having been in a great measure the result of the influence of his own writings and teachings in

favour of the separation of church and state. He died 18th May 1847. V. was an eloquent and earnest preacher, clear and brilliant, rather than profound in thought; and although highly evangelical and orthodox, advocated the utmost liberty and toleration of opinion and practice in matters of religion. He wrote largely both on literature and religion, and most of his works have been translated into English. His works on French literature shew that he was thoroughly acquainted with its history, and possessed the critical faculty in no mean degree; as a philosophico-religious writer, he is very popular among the educated religious public both in England and America. His principal works are: *Chrestomathie Française* (3 vols. 1829); *Histoire de la Littérature Française au XVIII. Siècle; Etudes sur la Littérature Française du XIX. Siècle*, 3 vols.; *Mémoire en Faveur de la Liberté des Cultes* (1826); *Discours sur quelques Sujets Religieux* (1831), and *Nouveaux Discours*, &c. (1841)—from which two last-mentioned works selections have been translated into English, and published under the title of *Vital Christianity; Etudes sur Blaise Pascal, Etudes Evangéliques*, and *Nouvelles Etudes Evangéliques*, which have been rendered into English as *Gospel Studies*, &c.

VI′NIC ACIDS, an important group of acids, whose mode of formation may be thus described. When a mixture of concentrated sulphuric acid with any of the alcohols is heated to about 212°, chemical action takes place, and the result is the formation of a new coupled or conjugated acid, in which the elements of one molecule of the alcohol radical and one of sulphuric acid, H_2SO_4, are present. In these compounds, the existence of sulphuric acid can no longer be detected by the addition of baryta; the new acids forming soluble baryta-salts. As examples of these acids may be mentioned sulphomethylic or methyl-sulphuric acid, $(CH_3)HSO_4$, and sulpho-ethylic or ethyl-sulphuric acid, $(C_2H_5)HSO_4$, which has been already described under its old name of *Sulphovinic Acid.*

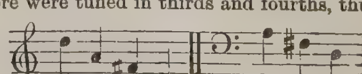
VI′NLAND—i.e., WINELAND—the name given to the chief settlement of the early Norwegians in North America. It is undoubtedly represented in modern times by part of Massachusetts and Rhode Island. The first that saw it was Bjarne Herjulfson, who was driven thither by a storm in the summer of 986 A.D., when making a voyage from Iceland to Greenland, of which country, his father, Herjulf and Eric the Red, were the earliest colonists. But Bjarne did not touch the land, which was first visited by Leif the Lucky, a son of Eric the Red, about 1000 A.D. The latter built a number of wooden houses, which were called *Leifsbúdir* (Leif's bothies?). A German of the name of Tyrker, who accompanied him, noticed the grape growing there, as in his native country, and hence Leif called the region 'Vinland.' Two years after, Leif's brother, Thorwald, arrived, and in the summer of 1003, led an expedition along the coast of New England, southwards, but was killed the year following in an encounter with the natives. The most famous of the Norwegian explorers, however, was Thorfinn Karlsefne, an Icelander, who had married Gudrid, widow of Thorstein, a son of Eric the Red, and who in 1007 sailed from Greenland to V. with a crew of 160 men, where he remained for three years, and then returned, after which no further attempts at colonisation were made. Rafn (q.v.), in his *Antiquitates Americanæ*, has published the most complete collection of the evidence which proves the pre-Columbian colonisation of America. See Wilhelmi's *Island, Hvitramannaland, Grönland und Vinland* (Heidelberg, 1842). Both Rafn and Finn Magnusen are excessively anxious to shew that Columbus derived his first hints of a new world from the accounts of these old Icelandic expeditions. Their *amor patriæ* perhaps leads them too far, but, on the other hand, it is well to bear in mind that Finn Magnusen, in one of the early numbers of the *Nordisk Tidsskrift for Oldkyndighed*, has conclusively established the fact that Columbus did visit Iceland in 1477, 15 years before he undertook his great expedition across the Atlantic; and it is not at all improbable that he may have heard, while there, something of the long-abandoned Vinland, and so had his adventurous thoughts first turned in that direction.

VINNI′TZA, a town of West Russia, in the province of Podolia, stands on both banks of the Bug, 100 miles east-north-east of Kaminetz. It was founded in the 14th c., and has suffered much from the invasions of Tartars and Cossacks. There are very few factories, and the trade, which is not extensive, is carried on exclusively by the Jews. Pop. 11,055.

VIOL (Mid. Lat. *vitula;* Ital. *viola*, derivation uncertain), a musical instrument played with a bow, no longer in use, which was the immediate precursor of the violin. It is to be seen represented on monuments as far back as the close of the 11th century. The belly and back were flat; there were larger bends in the sides than in the violin; and frets, like those of the guitar, were placed on the neck of the instrument, to shew where the fingers of the left hand should be put to produce the desired notes. There was great variety in the number of strings: in Germany, three, four, and five were all common; in Italy, there were usually six. The strings were tuned by fourths and thirds. There were four sizes of viol in use for treble, alto, tenor, and bass respectively, and they were often played together in concerted music. The smaller viols were called *viol da braccio*, from being held with the arm; the larger, *viol da gamba*, from being placed between the legs. The treble viol was rather larger than the modern violin. The viol da gamba, or bass viol, held its place longer than the smaller viols, but was eventually superseded by the violoncello.

VIO′LA, ALTO VIOLA, or TENOR VIOLIN, a larger description of violin, to which the part between the second violin and bass is generally assigned. It has four gut strings, the two lower covered with silvered copper wire. They are tuned by fifths, thus, , exactly an octave above the violoncello. The compass is from  to , or higher, and the music is generally written on the alto clef.

VIO′LA D'AMO′RÉ, an obsolete instrument of the viol tribe, revived a few years ago with some success by M. Urhan at Paris. It had five or seven strings of catgut, which were placed and played as in other bow-instruments; but below them, and passing underneath the bridge, were five or seven other strings of metal tuned in unison with them, which vibrated sympathetically when the former were played; giving to the music a mysterious resonant character. The compass was at least three octaves and a half. The strings of M. Urhan's viola d'amore were tuned in thirds and fourths, thus:



VIOLA′CEÆ, a natural order of exogenous

plants, of which about 300 species are known, natives both of temperate and tropical countries, those belonging to the former being generally herbaceous, and those belonging to the latter generally shrubby. They have simple leaves with persistent stipules. The calyx consists of five persistent sepals, usually elongated at the base; the corolla of five hypogynous petals, unequal in the sub-order *Violeæ*, and equal in the sub-order *Alsodeæ*. There are five stamens inserted in a hypogynous disc; the filaments prolonged beyond the anthers. The ovary is one-celled, generally with many ovules, the style single, with an oblique stigma. The fruit is a three-valved capsule, with many seeds. The best known species are the Violets (q. v.), noted for their beauty and fragrance. Emetic and purgative properties prevail in the order, and some of the South American species, particularly of the genus *Ionidium*, yield valuable medicines. See IPECACUANHA and CUICHUNCHULLI. Yet the leaves of the Lobolobo (*Conohoria* or *Alsodeia lobolobo*) are used in Brazil as spinach.

VIOLENT PROFITS, in the Law of Scotland, mean the income or rent enjoyed by one who forcibly or unwarrantably detains land to which he has no title. Such profits are held to be the full profits which the landlord could have made either by possessing the lands himself or by letting them.

VI'OLET (*Viŏla*), a genus of herbaceous plants, mostly perennial, of the natural order *Violaceæ*. They have a short stem, or are stemless, having in the latter case a short root-stock (rhizome); the leaves are alternate, and have long stalks; the flowers have five petals, different in form and size, the lowest having a spur behind. Nearly 200 species have been described, natives chiefly of northern temperate countries. Several species are much cultivated in gardens, some, as *V. tricolor*, on account of their beautiful flowers; others, as *V. odorata*, on account of their fragrance. *V. tricolor*, the PANSY, PANSY V., or HEART'S EASE, is very

1, Hairy Violet (*Viŏla hirta*); 2, Heart's Ease (*Viŏla tricolor*).

abundant in fields, meadows, woods, &c., in Britain and in most parts of Europe, and the north of Asia; it is also found in North America, although it has probably been introduced there from the old world. It is a very variable plant, its flowers differing much in size and colour, but is readily distinguished by its large lyrato-pinnatifid stipules. The stem is somewhat triangular, branching, and diffused. In some of its most common forms, this plant is a mere despised weed, with small flowers; other wild forms have much larger flowers; and to it are referred the large and beautiful garden pansies, the varieties of which are innumerable. The Pansy (Fr. *pensée*, probably from the drooping attitude of the flower, suggestive of thoughtfulness) is one of the finest of florists' flowers, and no flower has been more improved by cultivation. Another species has of late years been introduced into cultivation, *V. Altaica*, a native of Siberia, and by itself, or by hybridisation with *V. tricolor*, has become the parent of many garden pansies. In a wild state, it has oval leaves, and large yellow or purple flowers. The finest garden pansies are not preserved or propagated without great difficulty, and require most careful cultivation, without which they quickly relapse to their wild forms. Florists demand that a pansy shall have a round, flat, and very smooth edge, the petals thick and velvety, the three lower petals alike in their ground colour, the lines or pencillings in the centre bright and distinct, the two upper petals—which always differ in colour from the others—perfectly uniform, the flower measuring at least an inch and a half across.—The SWEET-SCENTED V. (*V. odorata*) is common in grassy places in England, and throughout Europe and the north of Asia. The flowers are either of a deep blue colour, or more rarely white. Several other species, with pale blue flowers, and destitute of smell, are common in meadows and woody glades in Britain and other parts of Europe.—The DOG V. (*V. canina*) is one of the most common ornaments of hedgebanks.—North America has a number of species, one of which, *V. blanda*, is sweet-scented. The Himalayas produce a number of species very similar to those of Europe. The roots of several species of V. were formerly used in medicine. They contain a bitter alkaloid, *Violine*, which acts as an emetic and purgative. The petals of the sweet-scented V. are used for the preparation of *Juice* or *Syrup of Violets*, which is used as a gentle purgative for children, and also as a chemical test, being reddened by acids, and rendered green by alkalies. The bruised leaves of *V. tricolor* are sometimes used as a remedy for ringworm.—The DOG'S TOOTH V. (*Erythronium dens canis*) has no connection with this genus, but is a very beautiful flower of the natural order *Liliaceæ*.

VIOLET STONES, the name given to certain stones found upon high mountains, as in Thuringia, upon the Harz Mountains and the Riesengebirge, which, in consequence of being covered with what is called *Violet Moss*, emit a smell like that of violets. They retain this smell for a long time, and it is increased by moistening them.—The VIOLET MOSS (*Byssus Iolithus*), which some botanists have been inclined to rank with lichens, and others with fungi, consists of simple articulated threads, and spreads over the stones in the form of a delicate incrustation, which at first is reddish brown, but in a more advanced stage, yellowish green. It was formerly in use as a popular remedy for feverish cutaneous eruptions.

VI'OLIN (diminutive from *viol*), a stringed musical instrument played with the bow. Like other bow-instruments now in use, it consists of a wooden sonorous chest, formed of two slightly arched surfaces, known as the back and belly, united by sides or ribs, and with a curve or hollow on each side in the middle of the length—a neck or fingerboard attached to the chest, and strings, fastened at one end to the belly by a tailpiece or projection of wood, and at the other to the head or

extremity of the neck, where they can be tightened or loosened at pleasure by turning-pins. The strings thus passing over the belly are raised up from it by a bridge; and on the belly there are two sound-holes opposite each other, of a form resembling the letter *f*, or rather the long *ʃ*. The sounds are produced by drawing a bow across the strings, the upper surface of the bridge being convexly curved, so as to enable the bow to be drawn along each string separately, without coming in contact with the rest. The modern violin has four strings of gut, the lowest covered with fine silvered copper wire, or sometimes, in the best instruments, with silver or even gold wire. These strings are tuned in fifths, thus, , and the highest string is called the first. The bow is held in the right hand, and the different sounds of each string are obtained by stopping, i. e., pressing it with the finger against the fingerboard at certain distances, thus shortening the vibrating portion, and raising the pitch of the sound. Very high notes are produced by the Harmonics (q. v.) of the string, which, instead of being pressed against the fingerboard, is touched lightly, the sound resulting from the vibration being, not as in ordinary cases, of the part of the string between the point of stopping and the bridge, but of a harmonic section of it. A peculiar modification of tone is produced by the application of the *mute*, or *sordino*, a little wooden instrument placed on the bridge. A violin or other bow-instrument may occasionally be played *pizzicato*, i. e., with the fingers, as a harp or guitar. The compass of the violin is about three octaves and a half, from  to , with all the intermediate semitones; but the highest notes are apt to be harsh and squeaking. Though chiefly an instrument of melody, it is to a limited extent capable of harmony by double stops—chords of two notes may be struck together, and three or four notes may be played in arpeggio. Few instruments can compare with the violin in power of expression and execution. It has an unlimited command over a very wide range of sounds, to which any degree of piano and forte, of staccato and legato, can be imparted. In orchestral music, there are always two different violin parts for treble and alto, known as first and second violin; and the same is generally the case when the violin is used in concerted music, the usual arrangement of stringed quartett music being for two violins, viola, and violoncello.

Recent writers trace the origin of the violin to the Indian *Ravanastron*, yet played by the poor Buddhist monks who go begging from door to door, and traditionally believed to have been the invention of Ravana, king of Ceylon, 5000 B.C. From the Ravanastron sprang the *Goudok* of Russia, and the *Cruth* of Wales—the latter in use before the 6th c. —both of which seem to have differed from later instruments of the same tribe in having the upper surface of the bridge flat, so that all the strings had inevitably to be sounded at once. The Viol (q. v.) was the more immediate precursor of the violin and of its relatives of deeper pitch, the violoncello and double bass. The earliest violins seem to have been those of Gasparo di Salo in Lombardy, 1560—1610. During the 17th c., the family of the Amati at Cremona, including Andrew, his sons Jerome and Antonio, and Nicolo, son to Jerome, produced violins the wonder of succeeding times, whose tone and quality more recent makers have in vain sought to equal. Antonio Stradivari, also of Cremona, pupil of Nicolo, if possible surpassed the Amati, and for a time the repute of Cremona was kept up by the families of the Guarneri and Ruggieri. Next to the Cremonese violins, in the estimation of connoisseurs, stand those of the Tyrolese makers, Jakob Stainer, and Matthias Klotz and his sons. Experience has shewn that the minutest details of form and proportion, and the material of which each separate part is made, are matters of vital importance to the quality of the violin. The great makers seem by a succession of delicate experiments and observations to have attained to acoustical qualities of high perfection, which their careful workmanship and extreme manual dexterity enabled them in all cases unfailingly to reproduce.—See Otto's *Treatise on the Structure and Preservation of the Violin;* Sandys and Forster, *History of the Violin;* Fetis. *Notice of Antonio Stradivari, with Researches on the Origin and Transformations of Bow-instruments.*

VIOLONCE'LLO (diminutive from Ital. *violone*, large viol or double bass), a large instrument of the violin class, held by the performer between his knees. It has four gut strings, the lowest of them covered with silvered copper wire, and is tuned thus, in fifths: . Its compass extends from  to . Its signature is usually the bass clef, the tenor or treble clef being used for the higher notes.

VIOTTI, GIOVANNI BATTISTA, an eminent violin-player, born at Fontanetto in Piedmont, in 1753, and chiefly educated under Pugnani at Turin. After holding for a short time the appointment of first-violinist in the royal chapel at Turin, he relinquished that office, in order to travel in Europe with Pugnani. In Berlin, St Petersburg, Paris, and London, his playing created a *furore*. He first visited London in 1792, and was engaged there at Salomon's concerts, and for a time as leader of the orchestra in the King's Theatre. A groundless charge raised against him of being a Revolutionary agent, drove him from England; but after living for a time in retirement at Hamburg, he returned to London, entered into speculations which ruined his fortunes, and died there in 1824. His compositions include violin concerts and quartetts for violin, tenor, and violoncello, violin duets and solos, and a few pianoforte compositions. His playing was characterised by a vigour of style and purity, as well as brilliancy and elegance, previously unknown; and he has been considered the father of the modern violin school.

VIPER (*Vipĕra*), a genus of serpents of the family *Viperidæ* (q. v.), having the head depressed, oblong-ovate, somewhat compressed before, and wider behind the eyes; the head covered with shields, the tail with two rows of plates beneath. Some naturalists divide the genus into two: *Vipĕra*, having one rather large shield in front of the head, the rest of the head covered with small shields, and the muzzle more or less recurved; and *Pelias*, having three shields on the head larger than the rest, the nose blunt. To the latter section belongs the common V. or Adder (*V. communis*, or *Pelias berus*), which is found throughout Europe from the

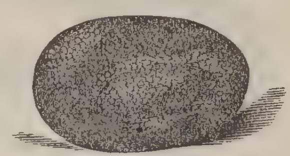
north of Russia to the Mediterranean, and is plentiful in most parts of England and Scotland. It is not found in Ireland. It seldom attains a length of much more than two feet. The head is depressed, and almost oval, slightly widening behind the eyes; the gape as long as the head. Although there are no teeth, except the poison-fangs, in the upper maxillary bones, there is a row of small teeth in the palatine bone on each side. The neck is rather smaller than the back of the head. From the neck, the thickness increases to near the middle of the entire length, and then diminishes to the vent. The tail tapers more rapidly, and ends in a point. The tail varies in the proportion of its length to that of the body, but is generally not more than one-third of the entire length. The smaller shields of

Common Viper or Adder (*Pelias berus*).

the head are in some specimens very symmetrically placed, but irregularly in others. The ground colour varies considerably, being in general nearly olive, rich deep brown, or dirty brownish yellow. A mark between and rather behind the eyes, a spot on each side of the hinder part of the head, a row of confluent rhomboidal spots running along the upper surface, the whole length of the body and tail, and a row of small irregular triangular spots on each side, are much darker than the ground colour, often almost black; and in all varieties of colour these markings appear. The under parts are of a lead colour. Vipers are sometimes found of colour very different from the ordinary kind, which some naturalists have too hastily described as distinct species. Thus, in some parts of England, a *Black V.* is occasionally met with, the ground colour of which is a rich black; the characteristic markings visible in particular lights, of a more intense black than the rest. A *Blue-bellied V.* has also been described, but differs little from the ordinary kind. A variety also occurs with the ground colour dirty white, the markings jet black. The *Red V.* has the ground colour brick-red, the markings rusty brown. It differs, however, from the ordinary kind in other particulars. There are some slight peculiarities in the markings, and the head is broader behind the eyes. The Red V. is found in some parts of the south of England.

The V. is the only venomous serpent found in Britain. Its bite is attended with much pain, and other serious consequences; but is seldom, if ever, fatal in Britain, although it is said to be so in warmer countries. The remedies employed for it are generally the external application of hot olive oil, and the internal use of olive oil and of ammonia, or strong stimulants such as brandy taken in large doses.

The V. inhabits heaths, dry woods, and dry banks. It preys on mice, frogs, small birds, and other small animals, which are killed by its poison-fangs, and swallowed entire. It hybernates during several months of the year, when many vipers may often be found entwined together in a torpid state. The poison is at this time inert, or nearly so. The V. is a good swimmer, and may occasionally be seen on lakes such as Loch Lomond, crosssing from one island to another. The young are produced in the early part of summer, from twelve to twenty or more at a birth. The V. is ovo-viviparous, the eggs probably bursting in the act of parturition. Their investing membrane is so thin and slight as to be very easily torn. The young V. is coiled up so closely in the egg as almost to appear a solid mass, but the moment it is set free it becomes active, and is ready to throw itself into an attitude of defence. The heat of the mother's body is not sufficient for the development of the embryo, as in mammals, but that of the sun is required, and the pregnant female viper may often be found stretched out in the sunshine, more lethargic than in ordinary circumstances.



Young Viper's Position in the Egg.

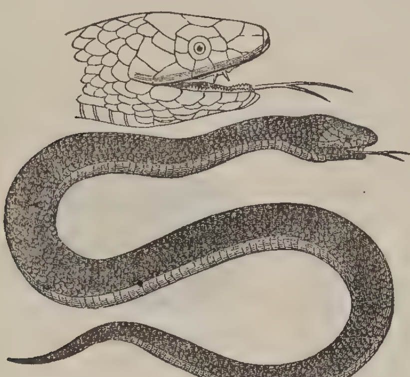
It has often been alleged that vipers swallow their young, to preserve them from danger—as, indeed, other serpents also are said to do—and there is nothing unreasonable in the supposition, as the young could live for some time in the stomach of the mother; but evidence is still wanting of the fact. The subject has been discussed, time after time, in publications devoted to natural history, but the original uncertainty still remains. Witnesses evidently truthful assert the fact, but eye-witnesses of the act of swallowing are wanted, the sum offered by Mr Frank Buckland to whoever will bring a V. with the swallowed young in her stomach, to be by him dissected, never having been claimed. That young vipers issue from the body of a crushed V., is easily accounted for, from what has been already stated.

The name V. (Lat. *Vipera*) is supposed to be a contraction of *Vivipara*, but the derivation is doubtful. The name Adder (Scot. *Ether*, Old English *Eddre* or *Neddre*) is from the Anglo-Saxon *Naedre*, nether or lower, a term applied to all serpents.

Pliny, Galen, and other ancient writers, ascribe great medicinal virtues to broth made of vipers, and to the flesh of the animal. Vipers entwined together in hybernation were supposed to produce the *Ovum Anguinum*, to which great virtues were imagined to belong; and *snakestones* were until lately quite common in many parts of Britain, sometimes rounded pieces of stone, rather larger than marbles, sometimes glass beads of various forms, which were supposed to cure vipers' bites, and to be otherwise useful.

VIPE'RIDÆ, a family of venomous serpents, having the upper jaw toothless, but with movable fangs in front, no pit between the nostrils and eyes, the scales generally keeled, the tail short and tapering. More than twenty species are known, natives of Europe, Asia, Africa, and Australia. No species has been found in America. To this family belong the Common Viper (q. v.) of Europe, the Horned Viper or Cerastes (q. v.) of Northern Africa and the west of Asia, the Puff Adder (q. v.) of Africa, and the Death Adder of Australia. The Death Adder (*Acanthophis tortor*) differs from most of the V. in not having the scales keeled. It is widely diffused

in Australia, where it is also known as the Black Snake. It is much dreaded, as its bite is said to be sometimes fatal in a quarter of an hour. It has two poison fangs on each upper jaw. The tail



Death Adder (*Acanthophis tortor*).

ends in a small recurved spine. The V. are most numerous in warm climates, in which also their bite is more deadly than in colder ones.

VIPER'S BU'GLOSS (*Echium*), a genus of plants of the natural order *Boragineæ*, having a calyx with five deep segments, an almost bell-shaped corolla, with dilated throat, and irregular limb, very long unequal filaments, and a bifid style. The species are large herbaceous plants or shrubs, rough with tubercles and hairs. Their flowers are often very beautiful. The COMMON V. B. (*E. vulgare*), a large annual plant, is a native of Britain and of most

Viper's Bugloss (*Echium vulgare*).

parts of Europe, growing in dry places, not unfrequently in corn-fields. Its flowers are at first reddish, and afterwards blue. It derives its name, V. B., from spots on its stem, which somewhat resemble those of the viper; and the property of healing vipers' bites was therefore ascribed to it. Other herbaceous species are found in the south of Europe, North and South America, and other parts of the world. Shrubby species are found chiefly in the Canary Islands and in South Africa.

VIRCHOW, RUDOLF. See SUPP. in Vol. X.

VIRE, an ancient and pretty town of Normandy, France, in the dep. of Calvados, on the Vire, 35 miles south-west of Caen. It is built almost entirely of granite, and is surrounded by hills, between which are the celebrated valleys of Vire—*Vaux de Vire* (see VAUDEVILLE). Manufactures of cloth, stationery, and cheese are actively carried on. Pop. 6366.

VIRGI'LIUS MA'RO, PUBLIUS, after Homer, the greatest epic poet of antiquity, was born in the consulship of Crassus and Pompey, on the 15th of October 70 B.C., at Andes, a village not far from Mantua. It is probable that his father was the proprietor of a small estate which was farmed by himself. V. was liberally educated, and is believed to have studied successively at Cremona and Mediolanum (Milan). In philosophy, he was instructed by Syron, an Epicurean, and one of his fellow-students was that Varus to whom his sixth Eclogue is dedicated. Greek he learned at Neapolis (Naples) from the grammarian Parthenius. If we are correct in supposing that, in the first Eclogue, V. relates his own experience in the person of Tityrus, he first visited Rome 41 B.C., in his 30th year, for the purpose of reclaiming his lands, which were occupied by the soldiery of Octavianus, at the close of the war against the republicans. At Rome, he was introduced to Octavianus, through the influence of Pollio, or of some other patron, and further formed the acquaintance of his great protector, Mæcenas. He continued to compose his Eclogues—the tenth and last of which is dedicated to Gallus, and referred to the poet's 33d or 34th year. At the instance of Mæcenas, he commenced his *Georgics* in his 34th year, according to the grammarians, who also assign seven years as the time he spent in the composition of the work, which was carried on principally at Naples. The *Æneid* was his last performance, and must have occupied many of the latter years of his life. He went in 19 B.C. to Greece, where he meant to subject his great poem to a thorough process of revision and refinement; and his voyage to Athens was made by Horace the occasion of the ode (Book i. 3) commencing with 'Sic te diva potens Cypri.' At Athens, V. met Augustus on his triumphal return from the East, and the poet was induced to go back to Rome in his company. He had only got as far as Megara, however, when he was seized with illness, which became worse on his voyage to Italy. On landing at Brundisium, or, according to another account, at Tarentum, he was unequal to the fatigue of travelling; and after lingering for a few days, he died, in the 52d year of his age, 19 B.C. In compliance with his dying wish, his body was removed to Naples, and buried at the second milestone from that city, on the Puteolan Way. Pliny the Elder and Aulus Gellius are among the writers who say that on his deathbed V. desired his epic poem to be burned, rather than that it should see the light in its imperfect state; but that the injunctions of Augustus to his executors, or, according to others, the interposition of his friends Tucca and Varius, who persuaded him to bequeath it to them on the understanding that it should remain unaltered, were the means of preserving it. The incident is quite in keeping with all that we know of V.'s modesty of character. The liberality of his patrons had endowed him with considerable property. He had a house on the Esquiline, near the gardens of Mæcenas, where he lived with an elegant simplicity, while he allowed the public free access to his excellent library. He was tall of stature, dark of

complexion, and had the appearance of a farmer. His most finished poem is the *Georgics*, in which the various departments of agricultural concern are described with great clearness, and illustrated by episodes of the finest poetry. His *Æneid* shews rather what he might have been than what he was as an epic poet. Unfinished as it is, however, its merits have always secured him a place in the front rank of epic writers; while, more than any similar work of antiquity, it has furnished a model to the epic and narrative poets of modern Italy. He has been edited and translated by scholars of nearly every country and period. The best English translation is still the hasty one of Dryden, though the recent version of the *Æneid* by Conington is in some essential features a highly successful performance. The best editions are those of Heyne, Wagner, Forbiger, and Conington.

VIRGIL, the Magician, is the character in which the great Roman poet presented himself to the popular imagination of the middle ages. The origin of this singular delusion may be thus explained. From a very early period—almost, we may say, from the age in which he flourished—V. was acknowledged to be the prince of Latin poets. His poems threw all others into the shade, and this, not so much because they exhibited a finer and more original genius, as because their style was perfect, the subject of his *magnum opus* thoroughly national, and his immense historical and antiquarian lore devoted to the glorification of the Roman people. From him the grammarians selected the examples of their rules, and even composed treatises on special questions suggested by his poems. The rhetoricians, too, found there material for their themes and declamations, and the later poets imitated his phraseology. Very soon the idea sprung up that in his verses there lay hidden quite a peculiar wisdom and mystic meaning. Thus it happened, that as early as the 3d and 4th centuries, even Christian authors (e. g., Minutius Felix, Lactantius, and Augustine) had contracted the habit of regarding him reverentially, a feeling which in its turn induced them to use him for polemical, or at least theological purposes. Hence they sought to prove the beginning of the fourth Eclogue a Messianic prediction, and would have it that V. foresaw the day of Christ. This view rooted itself so deeply, that V. and the Sibyl (q. v.) were actually introduced into the liturgy of the church, along with the Messianic prophecies of the Old Testament, and in the 'mysteries' of the middle ages, are frequently cited as bearing witness to a coming Messiah. Furthermore, when the first ages of polemical theology arrived, biblical critics and controversialists did not hesitate to quote the verses of V. in elucidation of passages of Scripture, and in confirmation of their views. Later still, some of the scholastics endeavoured to give a 'moral' significance to the whole *Æneid;* and an epitome of sacred history even was manufactured out of its contents (see CENTO). Another use, or rather *mis-use* of the verse of V. had already begun during the Roman Empire, and affords additional evidence of the superstitious reverence that was gradually encircling the name of the poet: we allude to the custom of trying to discover one's fortune by selecting lines at random from his epic. See SORTES BIBLICÆ, SORTES VIRGILIANÆ. Ultimately, as may be seen from the *Divina Commedia* of Dante, V. came to be considered as a representative of pure enlightened reason; a highly gifted genius standing midway between paganism and Christianity.

We have remarked that this deep, half-religious veneration for V. displayed itself at a very early period. Soon after his death, statues were erected to his memory, even in the domestic chapels of the emperors; the anniversary of his birth was held sacred; pregnant women and poets made pilgrimages to his tomb, and hence it became inevitable that all sorts of myths should spring up and attach themselves to his history; but the predominant conception in the middle ages was that of a wise, pure, and patriotic teacher, endowed with magic power and lore—quite a different kind of being from the evilly disposed and dreaded 'sorcerer' of popular fancy. The Virgilian myths established themselves more especially in connection with the places where he was born, where he chiefly lived, and where he died—Mantua, Rome, and Naples; and there they even yet survive in some measure on the lips of the people. But, curiously enough, it was not from the Italians, but foreigners, that they first obtained literary consideration. The oldest document bearing on the subject of which we have any knowledge, is the *Otia Imperialia* of the Englishman, Gervase of Tilbury, who collected his stories from the mouths of the Neapolitan populace. A fuller account is to be found in the *Chronicle* of Arnold of Lübeck, who got his information from Conrad, Bishop of Hildesheim, Chancellor of the Emperor Henry VI. These were followed by their contemporaries, Helinandus, whose legendary history of V. is embodied in the 6th book of Vincentius Bellovacensis' *Speculum Historiale*, and the English monk, Alexander Neckam, in his *De Naturis Rerum*, the best parts of which (relating to V.) are preserved in the repeatedly published *Vitæ Philosophorum* of Gualterus Burlæus. From these four main sources, the later Virgilian myth-mongers have chiefly borrowed; of whom the two chiefly deserving notice are Buonamente Aliprando (author of a Chronicle of Mantua in *terza rima*, about the beginning of the 15th c.), and the so-called Pseudo-Villani (author of *Le Croniche dell' inclita città di Napoli* (Naples, 1526). Particular stories and allusions are found pretty thickly scattered through the whole literature of the middle ages after the 13th century. The first complete collection, however, of the Virgilian myths was the French 'people's book,' entitled *Faictz Marcueilleux de Virgille*, published in the beginning of the 16th c., by Jehan Trepperel at Paris, translations of which soon after appeared in Dutch and English. Even the distant Icelanders had heard of the great magician, and there still exists in MS. an Icelandic *Virgilius-Saga.* The greater part of the Virgilian myths collected in the 'people's books' are of various ages and origin, and have come down to us in different forms. Some have decidedly been shaped after Eastern models, but the majority are of Latin and Italian growth.—See Zappert, *V.'s Fortleben im Mittelalter* (Vienna, 1851); Siebenhaar, *De Fabulis quæ Media Ætate de Virgilio circumferebantur* (Berl. 1837); and Edélestand du Méril, *De Virgile l'Enchanteur* in his *Mélanges Archéologiques et Littéraires* (Par. 1850).

VI'RGINALS, a keyed instrument of former times. As described by Dr Burney, it resembled in form a small pianoforte, with a compass of four octaves, furnished with a quill and jack like those of the spinet, and a single string to each note. Queen Elizabeth is said to have been a skilful performer on the virginals; but the instrument cannot, as popularly supposed, have been named in honour of the Virgin Queen, having been so called before her majesty's time.

VIRGI'NIA, one of the thirteen original United States of America, lies in lat. 36° 30′—39° 25′ N., and long. 75° 10′—83° 43′ W.; bounded on the N. by Pennsylvania, Maryland, and West Virginia, E. by Maryland and the Atlantic, S. by North

Carolina and Tennessee, and W. by Kentucky and West Virginia. Area, 38,352 square miles, or 24,545,280 acres. It is divided into 99 counties. The chief towns are Richmond (the capital), Petersburg, Norfolk, Staunton, Waynesborough, Alexandria, Portsmouth, Lynchburg, and Fredericksburg. Chesapeake Bay, which divides the south-eastern portion of the state, affords deep and spacious harbours. The chief rivers are the Potomac, forming the north-eastern boundary; the James, York, Chickahominy, Rappahannock, Rapidan, Appomattox, Shenandoah, and the Nottaway and Roanoke, which empty into Albemarle Sound in North Carolina. Eastern V. is level or rolling land, rising gradually from the ocean and Chesapeake Bay. The western portion is hilly and mountainous; through its centre from north-east to south-west run the ranges of the great Appalachian system of mountains: (1) a low range on the east, commencing with the Bull Run Mountains, near the Potomac; (2) the Blue Ridge, more elevated, through which the Potomac passes at Harper's Ferry, and which forms the eastern boundary of the Shenandoah Valley; (3) the Great North Mountain and the Alleghany, which form for many miles the north-west boundary of the state. The highest peak, White Top, in Grayson county, is 6000 feet. Other peaks rise from 4000 to 4500 feet. The Valley of Virginia, or of the Shenandoah, is from 1200 to 1500 feet above the sea. The eastern coast is composed of tertiary sands, clays, and marls; further inland, strata of the miocene groups emerge from beneath these, and abut against granite, gneiss, and other metamorphic rocks, at the line of the lowest falls of the principal rivers, the head of navigation, and sites of the chief towns. In the metamorphic belt are gold mines, copper, iron, &c. There are two upper secondary belts parallel to the Blue Ridge, crossing the James above Richmond, with rich coal deposits. The valley is of the Lower Silurian, with rich limestones, hematite iron, and a fertile soil. On the western borders are mineral springs (hot and cold), sulphur, salt, gypsum, lead, &c. The western coal region, which is cut through by large rivers, and is one of the finest in the world, extends into the state of West Virginia. There are also deposits of fine marble, porcelain clay, fire-brick clay, fine granite, soap-stone, slate, &c. Among the natural curiosities are the Natural Bridge in Rockbridge county; Wier's Cave in Augusta county; Blowing Cave, which sends out a blast of cold air in summer, and draws in air in winter; flowing and ebbing springs; the Natural Tunnel, 70 feet high, in Scott county, &c. The climate of the east and south-east, or low and level portions, is hot, with malaria in the swampy river-bottoms, producing bilious and remittent fevers; the higher regions are cold in winter, but a large portion of V. is pleasant and healthful. The soil of the eastern portion is light and good, but much exhausted by repeated tobacco-crops. The valley is rich, producing wheat, Indian corn, tobacco, and various fruits. The chief products are tobacco, corn, oats, wheat, cotton, wool, coal, lumber, oysters, market-vegetables, and game. V. had 1509 miles of railroad in 1873, and several canals. V. has just established a system of free public schools, which has not yet gone into operation. The system is to be administered by a board of education, a state superintendent of public instruction, county superintendents, and district trustees. The Normal School at Richmond is aided by the Peabody fund, and 20 pupils are in training for teachers. The Coloured Normal Industrial School at Hampton is aided by the same fund, and 16 pupils are in training. Trustees had been appointed in ten counties, and a number of schools were established prior to Nov. 1, 1870. There are state institutions for blind, and deaf and dumb. The insane asylum is the oldest in the U. S. The government is republican, with a governor, lieutenant-governor, attorney-general, and two houses of the legislature, all elected by the suffrages of the citizens.

V., whose shores were first explored by Sebastian Cabot, 1498, and again under the auspices of Sir Walter Raleigh in the reign of Queen Elizabeth, in whose honour it was named, was first settled by an English colony, under the charter of the London Company, at Jamestown, on the James River, May 13, 1607—a colony consisting of gentlemen of fortune, and persons of no occupation, no families, twelve labourers, and very few mechanics. The friendly Indians sold them land and provisions; but the diseases of a damp climate swept off half the settlers the first autumn. The energy of Captain John Smith saved the colony from destruction; and in 1609, it was reinforced with 500 persons, including 20 women and children, who were reduced by sickness and starvation to 60. They had embarked, to abandon the settlement, when Lord Delaware came with emigrants and supplies. The marriage of John Rolfe to Pocahontas (q. v.) secured the friendship of the Indians. In 1619, 90 respectable young women were sent out from England, and sold to the planters for 100 lbs. of tobacco each; also 100 convicts, to supply labour; and a Dutch trader also sold them 20 negroes. In 1622, the colony was reduced by wars and massacres from 4000 to 2500; but in 1624 it became a crown colony, and increased, so that, in 1649, there were 15,000 English, with 300 'good negro servants,' and 20 churches. The great production of tobacco caused such a fall in price, that half the crop was burned. In 1671, the population was 40,000, including 2000 black slaves, and 6000 English convicts and redemptioners, of whom 1500 a year were imported. The now prosperous colony consisted of 48 parishes, but had, Governor Sir William Berkley thanks God, no free schools or printing, which he hopes they may keep free of for a hundred years, and says: 'God keep us from both!' In 1754, the colonial militia took part in the French war; and Major George Washington was in General Braddock's expedition. In 1769, Thomas Jefferson, a member of the House of Burgesses, which had been established in 1619, asserted for the colony the right of self-taxation, denying the right of parliament to tax the colonies. In 1773, Patrick Henry, Thomas Jefferson, and Richard Henry Lee were appointed a committee to confer with the other colonies, and urged upon their delegates the Declaration of Independence. V., the earliest settled, largest, and most populous of the thirteen original states, called the Old Dominion, has been called the Mother of Presidents, four out of the five before 1825 having been Virginians. She was the first to propose the confederacy and the constitution. In 1861, April 17, the legislature of V. passed the ordinance of Secession. The Confederate government was invited to Richmond, which became the centre of military operations. V. was restored to her place in the family of states on January 26, 1870. See UNITED STATES. The pop. of V., in 1800, was 886,200, of which the slaves were 345,796; 1820, 1,065,379—slaves, 425,153; 1840, 1,239,797—slaves, 449,087; 1860, 1,596,318—slaves, 490,865; 1870, 1,225,163; 1880, 1,512,565.

VIRGINIA, WEST, a new state, separated from the above, because antagonistic in political interests, was organized in August, 1861, and admitted into the Union by act of Congress approved December 31, 1862, and taking effect June 20, 1863. The state comprises 53 counties, lying west of the Alleghanies, having an area estimated at 23,000 square miles, and a population, according to the census of 1870, of 442,014. In the same year there were 2113

school-houses in West Virginia (495 having been added during that year), and 87,330 pupils. Three normal schools have been opened, and the West Virginia University has gone into operation. In 1873 there were 572 miles of railroad in W. V. Pop. in 1880, 618,457.

VIRGINIA, UNIVERSITY OF, an institution of learning at Charlottsville, Albemarle County, Virginia, 4 miles from Monticello, the seat of Jefferson, by whom it was planned and organised. It was chartered by the state in 1819, and opened in 1825. It is governed by a rector and nine visitors; Jefferson and Madison having been the first two rectors. It has schools of ancient languages and history; modern languages, history, and literature; mathematics; natural philosophy, mineralogy, and geology; chemistry, pharmacy, and materia medica; law; medicine; &c. The state pupils are free. The degree of Bachelor of Arts is conferred upon graduates in Latin, Greek, chemistry, moral philosophy, and French or German (with certain proficiency in mathematics, physics, and history or literature); that of Master of Arts requiring a more extended prosecution of these studies, with satisfactory examination in review on all the subjects embraced in the courses of these schools. There are (1875) 368 students. Library, 35,000 vols.

VIRGINIAN CREEPER. See VITACEÆ.

VIRGI'NIAN QUAIL, or COLIN (*Ortyx*), a genus of birds of the family *Tetraonidæ*, closely allied to quails and partridges, but differing from both in having a shorter and thicker bill, and a rather more lengthened tail. They are also not so indisposed to leave the ground and perch on trees, on the branches of which they run with facility. They are all natives of America. The best-known species is the VIRGINIAN COLIN (*O. Virginiana*), which is abundant in most parts of North America, and in some parts is commonly known by

Virginian Quail (*Ortyx Virginiana*).

the name of Quail, in others by that of Partridge. In size, it is intermediate between the common quail and the common partridge of Britain. The prevalent colour of the plumage is brownish red, the under parts whitish; but all parts are more or less mottled with different colours. The feathers of the head are capable of being erected into a sort of crest. The call of the male is popularly regarded as resembling the words, *Ah, Bob White!* The coveys of the V. Q. often approach houses in winter, and mingle with domestic poultry. Great numbers are killed by guns and taken in snares; and in the western and southern states many hundreds are often caught in a day by parties of men on horseback, who drive the coveys into a great cylindrical net. This bird is easily domesticated, and seems well fitted for the poultry-yard. It has been introduced into some parts of Europe, and may almost be regarded as naturalised although still rare in England.—There are several other species of the genus in Mexico, California, and the north-west of America, of which one, the CALIFORNIAN COLIN (*O. Californica*), is remarkable for its long and beautiful black crest.

VI'RGIN ISLANDS, a group of islands in the West Indies, partly belonging to Denmark, partly to Britain, form a connecting link between the Greater and the Lesser Antilles, directly east of Puerto Rico. The islands and islets are about 50 in number, but of these, only a few are of any considerable size or importance. Three of the islands, with an area in all of 119 sq. m., belong to Denmark—viz., St Thomas (see THOMAS, ST), St Croix (see CROIX, STE), and St John (with an area of 21 sq. m.); and the other islands, the chief of which are Tortola, Virgin-Gorda, Anegada, Vieque, and Culebra, belong to Great Britain. The area of the British possessions of the V. I. is 94 sq. m., or over 60,000 acres (Statistical Tables, 1862); and the pop. in 1861 was 6051, of whom 476 were white, 1557 coloured, and 4018 black. The characteristic physical features are rugged heights and precipitous coast-lines, marked by numerous bays, havens, and creeks. Extensive tracts of land, possessed by the emancipated blacks, are covered with guinea-grass, which forms good pasturage for cows, sheep, and goats. A valuable mine of copper has been worked at Virgin-Gorda; and gold, silver, and other valuable minerals are said to have been found; but the inhabitants obtain their livelihood chiefly by wrecking. The government is in the hands of a lieutenant-governor, a council, and assembly. In 1867, the revenue amounted to £2030, the expenditure to £1370. The value of the exports in the same year was £8389; of the imports, £11,092. Cotton, sugar, ginger, and indigo are the principal products.

VIRGIN MARY. See MARY.

VIRGIN'S BOWER. See CLEMATIS.

VIRIATHUS, a Lusitanian (i. e., Portuguese) patriot, who energetically strove to prevent his country from falling under the dominion of the Romans. He flourished in the 2d c. B.C. Originally a shepherd, he afterwards became a guerrilla chief, and appears to have supported himself (like many of the Lusitanian borderers) by predatory excursions into the neighbouring Spanish territory. This mode of life brought him into collision with Rome, and in the year 151 B.C., the proprætor, Ser. Galba, was ordered to invade the country, and reduce the Lusitanians to subjection. By an act of detestable treachery, Galba succeeded in destroying a large body of the natives; but the few who escaped (among whom was V.) were inspired with the most implacable animosity towards the Romans, and immediately proceeded to rouse the patriotic passions of their countrymen. V. soon rose into prominence. At first, he kept mainly to the mountains, and contented himself with harassing the enemy by sudden and fierce descents, but in 147 (having been formally chosen leader in a season of great peril, he gave battle to Vetilius, the Roman proprætor, near Tribola (a town of Lusitania, south of the Tagus), and inflicted on him a severe defeat. In the course of the next two years he repeatedly came off victorious in conflict with Roman armies; until in 144, the consul, Q. Fabius Æmilianus, encountered him in Andalusia with a large army of 15,000 foot and 2000 horse, and V. was driven back into his native fastnesses. But the Spanish tribes themselves now broke out in insurrection against their foreign masters; and after 143, the Romans had both a Numantine and a Lusitanian war to wage. The general sent against V. was the proprætor, Q. Pompeius, who, after a slight temporary success, was

utterly crushed at the 'Hill of Venus,' and forced to take refuge at Corduba (in Andalusia), while the conqueror wasted all the country round the Guadalquivir. Next year (142), the Romans were more fortunate. Q. Fabius Servilianus, consul, conducted the war, and succeeded in driving V. once more out of Spain, and in annihilating several guerrilla bands; but in 141, a terrible reverse befel him near Grisane, when the whole of his army was hopelessly surrounded in a mountain-pass, and the story of the Caudine Forks (q. v.) was repeated, by its unconditional surrender. V., like Caius Pontius, shewed a noble magnanimity in his hour of supreme triumph: he allowed his captives to go away free and unhurt, on condition of Servilianus allowing the Lusitanians to retain their independence, and accepting their alliance. His terms were accepted, and the Portuguese patriot seemed to have triumphed over his colossal adversary; but in 140, the consul, Q. Servilius Cæpio (brother of Servilianus), having received the command in Further Spain, suddenly and treacherously resumed the war against V., and fearing lest he should not succeed in fair fighting, bribed some Lusitanian envoys (who had been sent to him by V. with offers of peace) to murder their master, which they did while he lay sleeping in his tent. The death of this heroic chief was practically the ruin of Lusitanian independence; for though the followers of V. elected another leader in his place, and strove to carry on the war, they could scarcely maintain themselves in the field for the rest of the year, and were then glad to acknowledge the supremacy of the Romans.

VI'RTUAL VELO'CITY. See WORK.

VI'RUS (the Latin word for a *poisonous liquid*) is a term used in medicine to signify those mysterious poisonous agencies which produce Zymotic Diseases (q. v.), such as smallpox, measles, scarlatina, the various forms of continued fever, ague, hooping-cough, cholera, syphilis, glanders, hydrophobia, &c. While each of these morbid poisons (as they are frequently called) has a definite and specific action, they collectively obey certain laws. For example (1.), their actions are variously limited, some affecting only one organ or system of organs, while others involve two or more organs or systems of organs. Thus, in bronchocele or goitre, we have an example of a poison acting only on the thyroid gland, while in hooping-cough and hydrophobia, all the organs supplied by the pneumogastric Nerves (q. v.) are affected, and, in paludal or malarian poison most of the organs. (2.) Morbid poisons, like medicines and ordinary poisons, have their period of latency, which, however, here is usually much prolonged. While a medicine, e. g., is seldom longer than a few hours in exhibiting its effects, the poisons of scarlatina, measles, and smallpox remain latent in the system for at least seven, ten, and sixteen days respectively; while that of paludal fever and hydrophobia may be dormant for a year or upwards. (3.) When several tissues or organs are acted on, the actions may be simultaneous, but are more commonly consecutive, a considerable interval often elapsing between the attacks. (4.) Another law of morbid poisons is, that two may co-exist in the same person; for example, smallpox and cow-pox have often been seen at the same time in the same person. In this case, each disease runs its course unaffected by the other; but most commonly, when two co-exist, one lies latent while the other runs its course. Thus, a case of intermittent fever may suddenly subside, and smallpox make its appearance; on recovery from this disease, the intermittent fever may return.

Amongst the peculiarities presented by morbid poisons, the following points must be noticed: (1.) In experiments made on the inoculation of the smallpox virus by Dr Fordyce, it was found that extremely diluted poison, if it acted at all, produced the same effects when introduced into the system as the concentrated virus. Hence it may be inferred that the intensity of the disease is not proportional to the amount of virus received into the system. (2.) Women in childbed may not only engender a special poison of this class—that of puerperal fever—but are highly susceptible of these poisons, and almost always succumb to their action. (3.) Another peculiar law of morbid poisons, and one wholly unknown in medicinal substances, is, as Dr Aitken remarks, 'the faculty which the human body possesses of generating to an enormous extent a poison of the same nature as that by which the disease was originally produced. A quantity of smallpox matter not so big as a pin's head will produce many thousand pustules, each containing fifty times as much pestilent matter as was originally inserted; and the miasmata secreted by one child labouring under hooping-cough are sufficient to infect a whole city.' A remarkable illustration of the development of syphilitic poison from a single infant over a whole province is given in the article SYPHILIS. (4.) A still more remarkable fact is, that many of these morbid poisons possess the property of seldom occurring more than once in the life of the same individual. This is the case with scarlatina, measles, smallpox, hooping-cough, and (to a less extent) typhoid and typhus fevers. (5.) This class of poisons is powerfully influenced by climate, and probably by the nature of the soil. Thus, the severe forms of typhus so common in this country are hardly known in warmer climates, and the influence of cold weather on cholera and plague are well known.—For further information on this subject, the reader is referred to Dr Robert Williams *On Morbid Poisons;* and to the chapter on Zymotic Diseases, in the first volume of Aitken's *Science and Practice of Medicine*, from which we have drawn most of the preceding remarks.

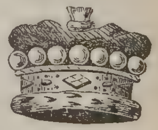
VISCONTI, a Lombard family which rose to sovereign rank in Northern Italy in the 13th c., and was equally distinguished by the share it took in the political contests of the Middle Ages, and by the services which it rendered to literature and science. The name V. is derived from the Latin *vicecomites*, and at first was merely the title of an office, but it gradually became a family surname, though when it came to be applied to this family authentic history fails to explain. The family descended, according to tradition, from Desiderius, the last king of the Lombards, and belonged to the feudal nobility of Northern Lombardy, having large estates near Lakes Como and Maggiore. The first who appears prominently in history is OTTONE, who became, in 1078, viscount of the archbishopric of Milan. The great Lombard families having, in course of time, split up into a multitude of lines, each in possession of a petty sovereignty, the V. on this account rose into comparative importance, more especially when, in 1262, another OTTONE was appointed archbishop of Milan by Pope Urban IV. This appointment, being considered by the people an infringement of the rights of the chapter, was opposed by them; and their leader, Martino della Torre, and his successors, kept possession of the property of the see, and forced the archbishop to exile himself for 15 years. At last, the exiled Ottone advanced at the head of a body of exiles and emigrants upon Milan, defeated and captured his rival in a bloody and desperate conflict near Desio (January 21, 1277), and entered the city amidst the acclamations of the people, who hailed

him as archbishop and perpetual lord of Milan. But he was not permitted to enjoy his newly-acquired dignities undisturbed, for, during the eleven years of his temporal sovereignty, he was engaged in almost uninterrupted warfare with the Torriani; and the contest was continued by his grand-nephew, MATTEO, who was chosen 'captain of the people' in 1288. Ottone continuing in the archbishopric till his death in 1295. Matteo proved himself a prudent and temperate ruler, and his influential position was recognised by the Emperor Adolf, who created him imperial vicar in Lombardy. Expelled by the Torriani and their allies in 1302, he was restored in 1311 by the aid of the Emperor Henry VII., and reappointed imperial vicar in consideration of the payment of 40,000 florins; and Pavia, Alessandria, Tortona, Cremona, Bergamo, Lodi, &c., having been forced to acknowledge his authority, the family became more powerful than ever. Unfortunately, however, a quarrel arose with Pope John XXII. regarding the appointment to the Milan archiepiscopate; and Matteo, obstinately refusing to yield to the papal pretensions, was condemned as a confirmed heretic, and himself and his descendants stigmatised as perpetually infamous (March 14, 1322). The people, despite their profound esteem and affection for their ruler, were horror-struck at this solemn denunciation; and the feeling that so many of his friends were falling away from him so preyed on Matteo's mind, that he died in June 1322, three months after his excommunication. His son GALEAZZO I. was chosen his successor, and immediately the pope proclaimed a religious crusade against the heretical V., and the 'holy army' under Raymond of Cardona advanced, in 1323, on Milan, committing the most horrible ravages during its march. But though the V. could not directly oppose such an overwhelming force, Galeazzo's brother Marco, an able and experienced warrior, hovered round the disorderly host, cutting off detached parties; and the Emperor Lewis (of Bavaria) having sent a body of troops to aid the V., the crusaders were driven back, totally defeated at Vavrio on the Adda (1324), and the remnant, with their leader Cardona, captured. Soon after, Galeazzo, by the intrigues of his ambitious brother Marco, was perpetually exiled, yet his eldest son, Azzo V., succeeded him, while Pope Nicolas confirmed the third son, Giovanni, in the archiepiscopate—events which led Pope John XXII., for the sake of maintaining some authority over Milan, to recal the excommunication he had pronounced against the Visconti. Azzo was the greatest prince of the race, and ruled Milan wisely and well; devoting his attention to the improvement and embellishment of the city, in which labour he was aided by the painter Giotto (q. v.) from Florence, and the sculptor Balducci from Pisa. As great in war as in peace, he extended his sway over almost the whole of Lombardy; and on his death in August 1339, 3000 citizens of Milan voluntarily assumed the garb of mourning. The council-general of Milan elected his two uncles, the archbishop GIOVANNI and LUCCHINO, as joint rulers in his stead; and on the latter, who was an able, resolute, and unscrupulous prince, wholly devolved the cares of the temporal sovereignty. Under his sway, Montferrat was added to the dominions of the V.; Pisa became tributary; a regular police was established; all offenders were punished with impartial severity; and a summary judgeship of appeals (*exgravator*), open only to foreigners to prevent party bias, was established. But the vices of suspicion, lust, and revenge threw a deep gloom over Lucchino's eminent qualities, led him into the commission of many cruel and tyrannical acts, and indirectly caused his own death by poison in January, 1349. From this time, the mild and peaceful archbishop reigned alone, availing himself of the assistance of his nephews in the more arduous tasks of government. He purchased Bologna for 200,000 florins in 1350; in 1353, accepted the lordship of Genoa, which had been almost crushed by its rival, Venice; and taking up the quarrel of his new subjects, equipped a fleet which, under Paganino Doria, gained a complete victory over the Venetians. He was the generous patron and friend of Petrarch, and the last good prince of the V. family. His three nephews conjointly succeeded him in October 1354; but in 1355, the eldest had died of poison, and his dominions were shared between the other two, GALEAZZO and BARNABO. Both princes were men of pre-eminent ability, but irreclaimably vicious, the latter being a very monster of cruelty. Bologna, which belonged to Barnabo, fell into the hands of the pope, who excommunicated Barnabo for attempting to recover it; but the V. prince laughed at the holy father's curse, and swore that he would be both pope and emperor in his own dominions. Innocent VI. then sent legates to him to propose terms, but the young savage compelled the unfortunate messengers to tear their master's bulls to fragments, and swallow them piece by piece. One of the legates, on becoming pope as Urban V., took revenge by proclaiming a crusade against Barnabo, which was joined by all the principal Italian princes; the Romagna and the borders of Lombardy were desolated by a long desultory strife; and though Barnabo was ultimately forced to accept a sum of money in place of Bologna, he took a humorous revenge on his ecclesiastical antagonists by compelling the clergy in his dominions to pay all the expenses of the war. One act of his, however, may be mentioned with commendation: he issued an edict forbidding even the mention of the names 'Guelf' and 'Ghibelline' under pain of having the tongue cut out; and his well-known stern adherence to such promises put an end to this long and mischievous controversy. His brother Galeazzo, who had established his residence at Pavia, was the 'Mæcenas' of his time: he steadily befriended Petrarch; founded, under his direction, the University of Pavia; and collected a considerable library. The invention known as 'Galeazzo's Lent,' a system of torture calculated to prolong the victim's life for 40 days, stamps him with the family character of cruelty. On Galeazzo's death, his son, GIAN-GALEAZZO, succeeded (1378) him in Pavia and its dependencies; and by treacherously seizing and imprisoning his uncle Barnabo of Milan, became sole ruler of Lombardy. He had all the great qualities and most of the vices of his race, and openly aspired to the sovereignty of Italy; conquering Padua, Verona, Vicenza; extending his dominions to the gates of Florence, which he also attacked; and purchasing from the Emperor Wenceslas the absolute sovereignty of his dominions, with the title of *Duke of Milan*, for 100,000 gold florins. This curtailment of the empire, however, displeased Germany, but the Palatine Ruprecht, who invaded Lombardy, received such a lesson from the condottieri of Alberico da Barbiano at Brescia, as caused him to gladly seek the north side of the Alps. Florence, the only remaining obstacle to the accomplishment of the V.'s ambitious scheme, was on the point of surrendering, when Gian died of the plague in 1402. He was a great patron of letters and science, gathered eminent men of all classes around him, reorganised the university of Piacenza, established a magnificent library, constructed the famous bridge over the Ticino at Pavia, and commenced the erection of the cathedral of Milan. His daughter Valentina married Louis, the younger brother of Charles VI. of France, and became grandmother of Louis XII., who upon this

relationship founded his claims to the Milanese. His sons, GIAMMARIA V. (Giovanni-Maria) and FILIPPO-MARIA V., reigned in succession; but the former, who was cowardly, suspicious, and of a cruelty partaking of insanity, was, in the interests of his subjects, stabbed to death, May 16, 1412; and the younger brother, equally timorous and suspicious, and of only average cruelty, became sole ruler. The Venetians on the east, the Marquis of Montferrat on the west, and the pope on the south, were rapidly curtailing his dominions, when, by a happy stroke of policy, he espoused Beatrice di Tenda, the widow of a condottieri leader, and thus obtained the services of a veteran band of soldiers. His fortunate choice of Carmagnola (q. v.) as his general led to the restoration of the former boundary-line of his dominions; and on his quarrel with the soldier who had served him so well, he was sagacious enough to supply his place by others as nearly equal in ability as could be obtained. In 1441, he engaged the services of Francesco Sforza, to whom he gave his natural daughter Bianca in marriage; and on his death in 1447, the V. family was succeeded by that of Sforza (q. v.) in the lordship of the Milanese. Collateral branches of the V. still exist in Lombardy.—See Lilla's *Famiglie Celebri Italiane*, Verri's *Storia di Milano*, and Muratori's *Annali d'Italia*.

VISCONTI, a family of archæologists and architects, the first of whom to rise to prominence was GIOVANNI BATTISTA V., a native of Sarzana, who settled at Rome, and after making for himself a great name as an archæologist, succeeded Winckelmann as prefect of the antiquities of Rome. He was employed by Clement XIV. and Pius VI. to collect works of ancient art for the Museum of the Vatican ('Museo Pio Clementino,' as, from its two principal benefactors, it was called); and afterwards, in 1776, commenced the writing of the letter-press which was intended to accompany the series of engravings of that splendid collection. He died in 1784.—ENNIO-QUIRINO V., eldest son of the former, was born at Rome, November 1, 1751, and was educated by his father, who intended him for the church. This profession, however, he afterwards refused to adopt, and was for a time disowned by his father. But at last, in 1778, the old man was glad to call his son to his aid, and together they prepared the first volume of the engravings of the *Museo Pio Clementino*. In 1784, he edited alone the second volume of the same series; he was also appointed conservator of the Capitoline Museum. The series of engravings of the *Museo* was regularly issued, the seventh and last volume being published in 1807. When Rome fell into the hands of the French, V. became a member of the provisional government, and afterwards one of the five consuls; but in November 1799, the arrival of the Neapolitan army forced him to emigrate to France, and from this time he settled at Paris. His great reputation as an archæologist having been long recognised among the learned men of the French capital, he was made an administrator of the Louvre, and Professor of Archæology; and drew up a catalogue of the works of art in the new museum (many of the items being his old familiar acquaintances of the Vatican), which, from the frequent raids of Napoleon on foreign collections, required to be frequently re-edited and enlarged. In 1804, he was requested by the emperor to select and publish a series of portraits of the distinguished men of ancient Greece and Rome; and this, probably the greatest of his works, appeared in two parts, *Iconographie Grecque* (3 vols. 4to, 1808) and *Iconographie Romaine* (1 vol. 4to, 1817). Contemporaneously, V. issued from time to time papers and dissertations on particular objects of ancient art. In 1815, he came to London by express desire of the British government, to fix a fair price for the Elgin Marbles (q. v.), and on his return wrote a Memoir explanatory of these sculptures. His last work was to complete his *Illustrazioni di Monumenti scelti Borghesiani* (Rome, 1821). He died after a long illness, February 1818, and his death was a source of grief to the learned throughout Europe, many of whom came from great distances to attend his funeral. Besides his immense antiquarian knowledge, V. possessed an extensive acquaintance with the history, languages, mythology, and manners of the classic age. A complete collection of his works was commenced at Milan in 1818, but has not been completed. See *Antologia* of Florence, No. 18; Tipaldo's *Biografia degli Italiani Illustri;* and Maffei's *Storia della Letteratura Italiana*.—His younger brother, FILIPPO AURELIO, was also an eminent archæologist, and was president of the commission of antiquities and fine arts at Rome from 1809 to 1814. He edited the *Museo Chiaramonti*, a sequel to the *Museo Pio Clementino*, and published several other works; but his chief attention was bestowed upon numismatology. He died at Rome in 1830.—LOUIS-JOACHIM V., the son of Ennio Quirino, was born at Rome in 1797, and after a careful education at Paris, was apprenticed to an architect. His progress in his profession was rapid, as he was appointed an inspector of public buildings as soon as his apprenticeship had expired, and shortly afterwards became one of the architects and surveyors of Paris, and architect of the Bibliothèque Royale in 1825. His works include various public monuments in honour of eminent Frenchmen, some of the first fountains of Paris, the tomb of Napoleon I., and various hotels and private residences, the chief of all being the plans for the completion of the Louvre on a most magnificent scale. V. died at Paris, 29th December 1853.—The nephew of the preceding, PIERRE-HERCULES V., is a celebrated archæologist, and Professor of Archæology in the French Academy.

VI'SCOUNT (Lat. *vice*, in place of, and *comes*, earl), originally the officer who acted as deputy to the earl, the earl being the king's immediate officer within his county. When the title of earl, originally personal, became hereditary, which took place in England under William the Conqueror, a deputy had necessarily to be appointed in all cases where he was a minor, or otherwise incapacitated from discharging the duties of his office. This deputy gradually became a permanent officer, otherwise known as the Sheriff, whose Latin designation continued to be *vicecomes*. The hereditary title of viscount is a degree of nobility unconnected with office. It was first granted in England to John Beaumont, created a peer by the title of Viscount Beaumont in 1440. A viscount is now the fourth degree of nobility in the United Kingdom. His coronet consists of a chased circlet of gold, round which are ranged an indefinite number of pearls, nine of them being most generally shewn, smaller than those of a baron's coronet, and in contact with each other. The mantle is scarlet, and has two doublings and a half of ermine. A viscount is styled 'Right Honourable;' his wife is a viscountess; his eldest son has no courtesy title of peerage; but all his sons and daughters are styled 'Honourable.'



Viscount's Coronet.

VI'SCUM. See MISTLETOE.

VISE (*Escalier à Vis*), a spiral or corkscrew

staircase, the steps of which wind round and rest on a perpendicular pillar, called the Newel (q. v.). In the Norman style, the steps rested on a spiral arch; but in later times, the steps were formed of single stones, stretching from the newel to the wall. This kind of staircase was that most generally used in medieval buildings.

VI'SEU, an episcopal city of Portugal, in the province of Beira, stands in a wide, fruit-producing plain, at the height of 1300 feet above sea-level, 50 miles north-east of Coimbra. Its cathedral is a striking flamboyant edifice, and contains a number of excellent pictures by Gran Vasco, the Portuguese Fra Angelico. In the vicinity is the Roman camp, called Cava de Viriato. The town, which is one of the oldest in the country, contains other Roman as well as Gothic and Moorish remains. A large fair is held here. Pop. 9160.

VI'SHNI-VOLOTCHE'K, a town of Russia, in the government of Tver, about 230 miles south-east of St Petersburg by railway. It is situated on the Tzna, on the Vishni-Volotchek water-route constructed by Peter the Great, and connecting the navigation of the Baltic and Caspian Seas, by means of the Volga, &c. There is a very extensive transit-trade. An immense quantity of corn passes through the town every year. Pop. 13,873.

VISHN'U is the second god of the Hindu triad, but is considered by his worshippers to be the supreme deity of the Hindu pantheon. See TRIMÛRTI and VAISHN'AVAS. The word is derived, by *S'ankara* (q. v.), in his commentary on the thousand names of V., and by other commentators after him, from *vish*, encompass, or *vis'*, penetrate; when, according to them, it would imply the deity who encompasses or penetrates the whole universe, both as regards its exterior appearance and its inward essence. A similar etymology is assigned to the word by *Yâska* (q. v.) in his gloss on the R'igveda; but as in this Veda, V. does not yet embody the notions connected with him at the epic and Purânic period of Hinduism (see INDIA, sec. *Religion*), Yâska does not impart to the name the implied sense given to it by the commentators just mentioned. In the R'igveda, V. is a representation of the sun, who 'strides through the seven regions of the earth,' and 'in three ways plants his step' (or, as Yâska explains, plants his steps so as to become threefold). And, according to one predecessor of Yâska, these three steps mean the manifestation of the sun at its place of rising, on the meridian, and at its place of setting; or, according to another, its manifestation on earth, in the intermediate space, and in heaven; when—as a later commentator observes—in the first of these manifestations, V. represents fire; in the second, lightning; and in the third, the solar light. From this position which V. holds in the R'igveda (see Veda), it results that he was not regarded there as supreme, or even as equal to other deities, who, at the Vedic period, occupied a foremost rank. He is extolled in several hymns as having 'established the heavens and the earth,' as 'being beyond mortal comprehension,' and so forth; but he is there also described as having derived his power of striding over the world from *Indra* (q. v.), and as celebrating the praises of this god. He is frequently invoked together with the latter, but apparently always as inferior to him; and often, too, he occurs in company with a number of other gods, such as Varun'a, the Maruts, Rudra, Vâyu, the luminous deities called *Âdityas*, and others, without any distinction being drawn in their respective rank. Fewer hymns, moreover, are separately devoted to his praise than to that of Agni, Indra, or other prominent gods of the Vedic period; and it deserves notice, too, that at that period he was not yet included amongst the Âdityas, for only at the epic period, when the number of these deities, originally varying from six to eight, was raised to twelve, V. was included in it—he then being named as the foremost of these luminous offsprings of Aditi, or space.

Although some of the Brâhman'as of the Vedas (q. v.) already shew the progress which the solar V. had made in the imagination of the people, and although they contain the germ of several legends, which, at a later time, became fully developed, the really mythological character of this god, as the basis of the divine worship now paid him by a large class of the Hindu population, belongs to the epic poems—the *Râmâyan'a* and *Mahâbhârata* (q. v.)—and to the *Purân'as* (q. v.). In the Mahâbhârata, V. is often identified with the supreme spirit; but while in some portions of this poem—the different parts of which belong to different epochs of Hindu antiquity—he is thus regarded as the most exalted deity; he is again, in others, represented as paying homage to S'iva (q. v.), the third person of the Trimûrti, and as acknowledging the superiority of this god over himself. Taking, therefore, the Mahâbhârata as a whole, he does not occupy, in this epos, the exclusive supremacy which is assigned to him in the Râmâyan'a, and still more in those Purân'as especially devoted to his praise.

The large circle of myths relating to V., in the epic poems and Purân'as, is distinguished by a feature which, though not quite absent from the mythological history of S'iva, especially characterises that of Vishn'u. It arose from the idea, that whenever a great disorder, physical or moral, disturbed the world, V. descended 'in a small portion of his essence' to set it right, to restore the law, and thus to preserve creation. Such descents of the god are called his *Avatâras* (from *ava* and *tr'i*, descend); and they consist in V.'s being supposed to have either assumed the form of some wonderful animal or superhuman being, or to have been born of human parents, in a human form, always, of course, possessed of miraculous properties. Some of these Avatâras are of an entirely cosmical character; others, however, are probably based on historical events, the leading personage of which was gradually endowed with divine attributes, until he was regarded as the incarnation of the deity itself. With the exception of the last, all these Avatâras belong to the past; the last, however, is yet to come. Their number is generally given as ten, and their names in the following order: 1. The fish-; 2. The tortoise-; 3. The boar-; 4. The man-lion-; 5. The dwarf-; 6. The Paras'u-Râma-; 7. The Râmachandra, or, briefly, Râma-; 8. The Kr'ishn'a and Balarâma-; 9. The Buddha-; and 10. The Kalki- or Kalkin-Avatâra. This number and enumeration of Avatâras, however, was not at all times the same. The Mahâbhârata, though also mentioning ten, names successively the Hansa-, tortoise-, fish-, boar-, man-lion-, dwarf-, Paras'u-Râma-, Râma-, Sâtvata-, and Kalkin-Avatâras. The Bhâgavata-Purân'a speaks of twenty-two Avatâras of V., which, for instance, also comprise Prithu (q. v.), Dhanvantari, the god of medicine, and Kapila, the reputed founder of the Sânkhya (q. v.) philosophy. Other works have twenty-four Avatâras, or even call them numberless; but the generally-received Avatâras are those ten mentioned before, an idea of which may be afforded by the following brief account.

1. The *Matsya-* or *fish-Avatâra*.—When, at the end of the last mundane age, the Bhâgavata-Purân'a relates, Brahman, the first god of the Trimûrti, had

fallen asleep, a powerful demon, *Hayagrîva*, stole the Vedas which had issued from the mouth of Brahman, and lay by his side. About that time, a royal saint, *Satyavrata*, had by his penance attained the rank of a Manu, and V., who had witnessed the deed of Hayagrîva, and intended to slay him, assumed for this purpose the form of a very small fish, and glided into the hands of the saint when the latter made his daily ablutions in the river. Manu, about to release the little fish, was addressed and asked by it not to expose it to the danger that might arise to it from the larger fish in the river, but to place it in his water-jar. The saint complied with its wish; but in one night the fish grew so large, that at its request he had to transfer it to a pond. Yet soon the pond also becoming insufficient to contain the fish, Manu had to choose a larger pond for its abode; and, after successive other changes, he took it to the ocean. Satyavrata now understood that the fish was no other than *Nârâyan'a* or V., and, after he had paid his adoration to the god, the latter revealed to him the imminence of a deluge which would destroy the world, and told him that a large vessel would appear to him, in which he was to embark together with the seven Rishis, taking with him all the plants and all the seeds of created things. Manu obeyed the behest of the god: and when the water covered the surface of the earth, V. again appeared to him in the shape of a golden fish with a single horn, 10,000 miles long; and to this horn Manu attached the vessel, by means of V.'s serpent serving as a cord. While thus floating in the vessel, Manu was instructed by the fish-god in the philosophical doctrines and the science of the supreme spirit; and after the deluge had subsided, the fish-god killed Hayagrîva, restored the Vedas to Brahman, and taught them to the Manu Satyavrata, who in the present mundane age was born under the name of *S'râddhadeva*, as the son of Vivasvat. —A fuller account of this Avatâra is given in the *Matsya-Purân'a*, where the instruction imparted to Manu by the fish-god includes all the usual detail contained in a Purân'a (q. v.), that relating to creation, the patriarchs, progenitors, regal dynasties, the duties of the different orders, and so forth. In the Mahâbhârata, where the same legend occurs, but without either that portion concerning Hayagrîva, or the instruction imparted by the fish, there is, besides minor variations, that important difference between its story and that of the Purânas, that the fish is not a personification of V., but of Brahman, and that the deluge occurs in the present mundane age, under the reign itself of the Manu, who is the son of Vivasvat.—The origin of this Avatâra is probably a kindred legend, which occurs in the *S'atapathabrâhman'a*, of the White Yajurveda (see VEDA); but there the fish does not represent any special deity, and the purpose of the legend itself is merely to account for the performance of certain sacrificial ceremonies.

2. The *Kûrma-* or *tortoise-Avatâra.*—When, of old, the gods felt their powers impaired, and were desirous of obtaining *Amr'ita*, the beverage of immortality, V. directed them to churn, together with the demons, the milk-sea, by taking the mountain *Mandara* for their staff, and his serpent *Vâsuki* for their cord, the gods to stand at the tail, and the demons at the head of the serpent; while he himself consented to support the mountain on his back, after having assumed the shape of a gigantic tortoise. The result of this churning of the sea of milk, was, besides the ultimate recovery of the Amr'ita, the appearance of a variety of miraculous things and beings; but it also led to a violent contest between the gods and demons, in which the latter were defeated. See RÂHU.—The idea of the lord of creation assuming the shape of a tortoise, and that of sacrificial liquids, especially clarified butter, becoming tortoise-shaped (*Kûrma*, the word for tortoise, meaning literally, 'badly or slowly going'), occurs also in the Yajurveda; but the legend on which the tortoise-Avatâra of V. is based seems to belong entirely to the post-Vedic period of Hinduism.

3. The *Varâha-* or *boar-Avatâra.*—It is supposed to have taken place when, at the period of creation, the earth was immersed in water, and V., in order to raise it up, assumed the form of a gigantic boar. In the earlier recension of the *Râmâyan'a* and the *Linga-Purân'a*, it was Brahman, the creator of the universe, who transformed himself into a boar for rescuing the earth from its imperilled position; and in the *Black Yajurveda*, where this idea is first met with, it is likewise said that the lord of creation upheld the earth, assuming the form of a boar. At a later period, however, this Avatâra is generally attributed to Vishn'u. Between both conceptions there is, however, also this great difference, that in the former the transformation of the deity into a boar has apparently a purely cosmical character, whereas in the latter 'it allegorically represents the extrication of the world from a deluge of iniquity, by the rites of religion.' (Wilson's translation of the *Vishn'u-Purân'a*, second ed., by F. Hall, vol. i. p. 59, note.) For the boar, as an incarnation of V., is the type of the ritual of the Vedas. He is described as the sacrifice personified; his feet being the Vedas; his tusks, the sacrificial post to which the victim is tied; his teeth, the sacrificial offerings; his mouth, the altar; his tongue, the fire; his hairs, the sacrificial grass; his eyes, days and night; his head, the place of Brahman; his mane, the hymns of the Vedas; his nostrils, all the oblations; his snout, the ladle of oblation; his voice, the chanting of the Sâmaveda; his body, the hall of sacrifice; his joints, the different ceremonies; and his ears as having the properties of voluntary and obligatory rites (*Vishn'u-P.*, vol. i. p. 63); and similar descriptions of the boar occur in the Harivan's'a (q. v.) and elsewhere; besides those relating to the immense size and wonderful appearance of the mysterious animal. In the *Bhâgavata-Purân'a*, another legend is also connected with this incarnation of V., still more distinctly proving that, at the Purân'ic period, it was viewed in a purely religious light. According to this legend, *Jaya* and *Vijaya*, two doorkeepers of V., once offended some Munis who claimed admission to the paradise of V., and in consequence were doomed to lose their position in V.'s heaven, and to be reborn on earth. They became thus the sons of *Kas'yapa* and *Diti*, under the names of *Hiran'yakas'ipu* and *Hiran'yâksha*. The former subdued the three worlds, and the latter went straight to heaven, to conquer also the gods. Thus threatened in their existence, the gods implored the assistance of V.; and V., who at that period was the mysterious or primitive boar, slew Hiran'yâksha. A similar contest between V. as boar and numerous demons, the progeny of Diti, always ending in the defeat of the latter, is also described in the *Mokshadharma*, one of the later portions of the Mahâbhârata; and from this and similar descriptions, it follows that the boar-Avatâra had gradually lost its original character, and assumed that common to the remaining Avatâras, of representing the deity as become incarnate, for the purpose of remedying moral or religious wrong, or of destroying influences hostile to the pretensions of the Brâhmanic caste.

4. The *Nr'isinha-* or *man-lion-Avatâra.*—*Hiran'yakas'ipu*, the brother of the demon Hiran'yâksha just mentioned, had resolved to become a sovereign

of the three worlds, and exempt from death and decay. To attain this end, he practised severe austerities, and ultimately received from Brahman, as the desired reward, a promise that he should become a supreme ruler, and death should not accrue to him from any created being, neither within his abode nor without, neither by day nor by night, neither in heaven nor on earth, nor by any kind of weapon. Possessed of the grant of this boon, he now gave course to the hatred he had conceived against V. for having killed his brother Hiran'yâksha. He oppressed all the gods, robbed them of their shares in the sacrifices, and threatened their destruction. But he had a son, *Prahrâda* or *Prahlâda*, who, through his religious studies and pious conduct, had become a devout worshipper of Vish'nu. When Hiran'yakas'ipu became aware of his son's partiality for this god, he first endeavoured to impart to him his own hostile feelings against V., but failing in this, resolved to kill him. All the means, however, he employed to this end remained vain; and when at last, Hiran'yakas'ipu, about to cut off the head of his son, sneeringly asked him why V., who, as he asserted, was everywhere, should not be present also in a pillar in the hall, which he struck with his fist, V. suddenly made his appearance in the shape of a being neither man nor animal, in that of a man-lion of fearful aspect and size; and after a violent struggle with the demon, killed him in tearing his heart out with his finger-nails. Prahlâda was then installed by him as sovereign over the demons, and, at the end of a pious reign, obtained final liberation.

5. The *Vâmana-* or *dwarf-Avatâra.*—Prahlâda's son was *Virochana*, and his son was *Bali*. The latter, after having conquered Indra (q. v.), ruled over the three worlds, and filled the gods with dismay for their future prosperity. They had, in consequence, recourse to V.; and when, at one time, Bali was celebrating a grand sacrifice, V., assuming the shape of a dwarf, humbly approached the demon king. Pleased with the devout and unpretending appearance of the little Brâhman, Bali asked him to demand a boon, however costly it might be. The dwarf, however, merely asked for so much ground as he could measure with three paces. The king smilingly granted so modest a request, though his family priest *Us'anas*, suspecting the true nature of the dwarf, strongly dissuaded him from doing so. But when the dwarf had obtained what he asked for, he strode with one pace over the earth, with a second over the intermediate space (the atmosphere), and with a third over the sky, thus leaving for Bali only the subterranean regions, which he assigned him for his future abode. The demons endeavoured to frustrate this result, after V. had taken his first two strides, but they were overcome by the followers of V.; and Bali, when resigning himself to his fate, in reply to a reproach addressed to him by the dwarf for trying to break his promise, uttered—according to the Bhâgavata-Purân'a—the following words, which may serve as one of many instances to shew how sacred a promise was held by the Hindus when once given, and even though artfully obtained: 'If, renowned chief of the gods, you consider the word which I uttered to be deceitful, I now do what is sincere, and can be no deception—place your third step on my head. Fallen from my position, I fear not the infernal regions, or binding in bonds, or misfortune difficult to escape, or loss of wealth, or your restraint, so much as I am afflicted by a bad name.' (See J. Muir's *Original Sanscrit Texts*, vol. iv. p. 128.) For his righteousness, he was then rewarded by V. with the promise, that after a temporary residence in one of the most delightful places of Pâtâla (q. v.), he should be born as the Indra, in the reign of the eighth Manu. In this incarnation as dwarf, V. is considered to have been a son of the same Kas'yapa who is also the father of Hiran'yakas'ipu and Hiran'yâksha; but while their mother is Dita, the dwarf's mother is Aditi (space); and since she previously had brought forth Indra, V. is sometimes called Upendra, or the younger or later Indra. As a son of Aditi, V. becomes one of the Âdityas (see before).—The Vedic conception of the three strides of V., as mentioned in the beginning of this article is doubtless the basis of the idea whence this Avatâra arose.

6. The *Paras'u-Râma-Avatâra*, or V.'s incarnation as Râma, the son of Jamadagni, armed with an axe (*paras'u*). *Arjuna*, a son of *Kr'itavîrya*, and king of the Haihayas, had obtained, as a reward for his piety, a thousand arms, and the sovereignty over the earth. The gods, frightened at his power, had recourse to V., and the latter resolved to be born as a son of Jamadagni, that he might slay him. Jamadagni was the son of *R'ichîka*, of the race of Bhr'igu, a pious sage who had married *Ren'ukâ*, the daughter of king *Prasenajit*, and had obtained five sons by her, the last of whom was *Râma*, or V. incarnate in this form. Ren'ukâ having once, for some supposed impropriety, incurred the anger of her husband, was, at his bidding, killed by her son Râma, but at the request of the latter, again restored to life; and her first four sons were likewise saved from the consequence of the wrath of Jamadagni by the intercession of their brother Râma. After this event had happened, or, as one account goes, previously to it, Arjuna came to the hermitage of Jamadagni, and was there hospitably received by the saint, who could treat him and his followers sumptuously, as he possessed a fabulous cow of plenty, that not merely supplied him with the milk and butter required for his sacrificial offerings, but with everything else he wished for. Struck by the precious qualities of this cow, and in spite of the kind treatment he had met with, Arjuna carried off with him the cow and her calf. When Râma, who, on this occasion, had been absent from home, returned to the hermitage, and learned what had happened, he took up his axe (or, as the Mahâbhârata says, his bow), and slew Arjuna, together with his army. The sons of the latter, to revenge their father's death, after some time, attacked the hermitage, and succeeded in killing Jamadagni. Thereupon, Râma made a vow to extirpate the whole Kshattriya or military race; and not satisfied with destroying the sons of Arjuna, he killed every Kshattriya whom he encountered afterwards. In this manner, the legend concludes, 'he cleared thrice seven times the earth of the Kshattriya caste'—killing the men of so many generations as fast as they grew to adolescence—'and filled with their blood the five large lakes of Samantapanchaka, from which he offered libations to the race of Bhr'igu.' He then performed a solemn sacrifice, and distributed the land and many riches amongst the ministering priests. The Mahâbhârata, which on two occasions relates this legend, in one place enumerates the Kshattriyas who escaped the destruction of their caste, and from whom the lines of the kings hereafter were continued; this account, however, is inconsistent with Purânic lists, in which the royal lineages are uninterrupted. There can be little doubt that a real historical conflict between the Brâhman'as and Kshattriyas underlies the conception of this Avatâra; one which has its parallel in the history of Vasisht'ha and Vis'wâmitra (q. v.).

7. The *Râmachandra-* or, briefly, *Râma-Avatâra.*—*Râvan'a*, a king of *Lankâ*, or Ceylon, a monster with ten heads and twenty arms, had, by dint of

austerities, obtained from Brahman the promise that neither gods nor demons should be able to take his life. In consequence, he oppressed the whole universe: the sun dared not shine hot, or the fire burn, or the wind blow, where he stood, and the ocean, when it saw him, became motionless. The gods, thus seeing the world and their own existence endangered, implored Brahman to protect them; and he, remembering that the demon, when asking for the boon he had granted him, omitted to include men among the beings that should not hurt him, advised the gods to pray to V. to become incarnate. This they did, and V. granted their prayer. At that time, *Das'aratha*, a king of Ayodhyâ, of the solar line of Hindu kings, performed the great horse-sacrifice in order to obtain sons; for though he had three wives, *Kaus'alyâ*, *Sumitrâ*, and *Kaikeyî*, he was without male progeny. This sacrifice became successful, for, when on the point of completion, a supernatural being appeared to him with a divine beverage, one-half of which he was to give to Kaus'alyâ, one-fourth to Sumitrâ, and the remaining fourth to Kaikeyî. And as this nectar which he gave them contained the divine essence of V., *Râma*, the son whom Kaus'alyâ brought forth, became one-half, the twins *Lakshman'a* and *S'atrughna*, born by Sumitrâ, together one-fourth, and *Bharata*, the son of Kaikeyî, another fourth, of the substance of Vishn'u. While Râma and his brothers were still boys, the sage *Vis'wâmitra* (q. v.) came to the court of Das'aratha, requesting him that he should allow Râma to proceed to his hermitage, in order to destroy there the Râkshasas, or fiends, who infested it, and disturbed his sacrificial rites. Though reluctantly, Das'aratha gave his consent to his departure; and Râma, accompanied by his brother Lakshman'a—who, throughout his brother's career, remained his faithful companion and ally—started on his first eventful journey; for it was marked by a number of wonderful exploits which he performed in killing the demons, and which already then revealed his divine mission. Having fulfilled the desire of Viswâmitra, he proceeded to Mithilâ, where King *Janaka* held a great assembly of kings, having promised to give in marriage his daughter *Sîtâ* (q. v.) to the prince who would be able to bend the bow with which S'iva (q. v.) once conquered the gods at the sacrifice of Daksha, and which now was in his trust. Yet so large and heavy was this bow, that not even the strongest of them could so much as move it. But when Râma arrived, and the bow was shewn him, he lifted it up and bent it, as it were in sport, and ultimately even broke it in the middle. Sîtâ became thus the wife of Râma; while Janaka gave *Urmilâ* to Lakshman'a, *Mân'd'avî* to Bharata, and *S'rutakîrtti* to S'atrughna. On his way home, Râma met *Paras'urâma* (see the sixth Avatâra), who, having heard of his namesake's bow-feat at the court of Janaka, challenged him to bend also the bow of V., which he had received from his father, Jamadagni, and if he could do so, to a single combat. Râma, displeased with the doubt of Paras'urâma in his strength, immediately seized the bow, bent it, and would have killed the son of Jamadagni, had he not respected his quality as a Brâhman: still, he destroyed the worlds which the latter had acquired by his penance, and thus excluded him from heaven. (This account given of the meeting of the two Râmas, in the Râmâyan'a, would seem to shew that at the time when this poem was composed, the *Paras'urâma* was not yet conceived as an incarnation of V., since he is represented in it as jealous of the defeat which S'iva's bow had suffered at the hands of the son of Das'aratha.) After this event, Bharata, and his brother S'atrughna, were sent by their father on a visit to Bharata's maternal uncle, *As'wapati*; and Das'aratha, who was old, and desired to retire from the world, made all preparations for installing his eldest son, Râma, as heir-apparent to the throne of Ayodhyâ. But in this design he was frustrated; for, through the intrigues of *Mantharâ*, the hunchbacked nurse of Bharata, and his queen Kaikeyî, he was, in a weak moment, prevailed upon to grant any wish which the latter would ask of him; and Kaikeyî, availing himself of Das'aratha's rashly-given promise, demanded of him the installation of her own son, Bharata, as heir-apparent, and the banishment to the forest of Râma for a period of fourteen years. A promise once uttered being irrevocable, and Râma having resolved not to cause a word given by his father to remain vain, neither the wishes of the people of Ayodhyâ nor those of Bharata and S'atrughna, who meanwhile had returned, and were enraged at what had occurred, could shake his determination to submit to his exile. Das'aratha died in consequence heart-broken, and Bharata assumed, till the return of Râma, the government of Ayodhyâ.

The long exile of Râma which now followed, and was shared in by his brother Lakshman'a, became, then, the source of the wonderful events which should hereafter lead to the destruction of the demon Râvan'a. They began with a series of conflicts which he had to sustain with the Râkshasas, who infested his forest abode, and which invariably, of course, ended in the destruction of these beings. One of these conflicts, however, was especially pregnant with the destiny he had come to fulfil. Râvan'a's sister, *S'ûrpan'akhâ* (lit., a female whose finger-nails were like winnowing baskets), was one of those demons who haunted the woods. She fell in love with Râma, but was repelled by him; and when, in a fit of jealousy, she attacked Sîtâ, Lakshman'a cut off her ears and nose. Enraged at this treatment, she repaired to her brother Râvan'a, and in order better to stimulate his revenge, she also excited in him a passion for Sîtâ. Râvan'a therefore started off for the forest Dan'd'aka, where Râma lived; and, aided by another demon, Maricha, who transformed himself into a golden-coloured deer, and thus enticed both brothers away from the hermitage, to chase after it, succeeded in carrying off Sîtâ to his capital. By means of some other supernatural events then happening, Râma discovered the fate of his wife; and the remainder of his exile is now filled up with his preparing for war with Râvan'a, conquering, and destroying him, and recovering Sîtâ, whose honour had remained untarnished during her long and severe trials when kept as a prisoner in the harem of Râvan'a. Some of the incidents of this struggle are of special interest, inasmuch as they are the basis of traditions still prevalent in India. They chiefly relate to the allies of Râma, who were no other than miraculous bears and monkeys, and by their magic powers mainly brought about the defeat of Râvan'a and his armies, while also helping him to communicate with Sîtâ during her captivity. All these bears and monkeys were of divine origin, produced at the behest of Brahman by the gods for the express purpose of becoming the allies of Râma. Thus, the bear-king, *Jâmbuvat*, issued from the mouth of Brahman himself; *Bâli* was a son of Indra; *Sugrîva*, of the Sun; *Târa*, of Vr'ihaspati; *Gandhamâdana*, of Kuvera; *Nala*, of Vis'wakarman; *Nîla*, of Fire; *Sushen'a*, of Varun'a; *S'arabha*, of Parjanya; and the most renowned of all, *Hanumat*, was a son of Wind. See the article HANUMÂN, where several of his feats are mentioned. They overbridged the sea, to carry their armies to Ceylon—whence the line of rocks in the channel is still

called *Râmasetu*, or Râma's Bridge—in the English maps, Adam's Bridge; they brought large rocks from the Himâlaya to support the bridge—whence the numerous rocks scattered all over India are supposed to have arisen as they dropped down on their transport to the sea; and they performed similar other feats, still commemorated in festivals performed in honour of Hanumat and his tribe. As is the case in other Avatâras of V., there is also in the Râma-Avatâra a personage who, though nearly related to the fiend doomed to destruction, acknowledges the divine nature of the incarnate god, and dissuades his friends from opposing him. In this Avatâra such a personage is *Vibhîshan'a*, the uncle of Râvan'a,

Agni. Sitâ. Hanumat. Râma.

Fig. 1.—Sitâ is seen undergoing the fire ordeal, to satisfy the world of her chaste escape from the power of Râvan'a, comforted by the presence of Agni, the God of Fire.—From Moor's *Hindu Pantheon.*

whose counsel, however, is disregarded. Similarly disposed is also *Kumbhakarn'a*, the brother of Râvan'a, who likewise understands that Râma is V.; but, as he yields to the orders of his brother, his fate is death. Vibhîshan'a, however, in reward of his proper conduct, is, after Râvan'a's death, placed on the throne of Ceylon. When, at the end of this fierce war, the time fixed for Râma's exile had expired, he returned to Ayodhyâ with Sitâ, whose purity had previously been tested by an ordeal of fire, and there received back from Bharata the sovereign power which, in the meantime, the latter had exercised in his stead; and at the end of a long and glorious reign, he became reunited with the splendour of Vishn'u. The story of this incarnation is briefly told in an episode of the Mahâbhârata (q. v.), and in several Purân'as; with the fullest detail, however, in the *Râmâyan'a* (q. v.). A copious abstract of the latter is given in the poem *Bhat't'ikâvya.* See SANSCRIT LITERATURE. The English reader may consult, for some further detail, an 'Analysis of the Râmâyan'a,' in Professor Monier Williams's *Indian Epic Poetry* (Lond. 1863).

8. The *Kr'ishn'a-Avatâra* and *Balarâma-Avatâra.*—The former of these two, which are generally treated as one, is the most interesting incarnation of V., both on account of the opportunity which it affords to trace, in Hindu antiquity, the gradual transformation of mortal heroes into representatives of a god; and on account of the numerous legends connected with it, as well as the influence which it exercised on the Vaishn'ava cult (see VAISHN'AVAS). In the Mahâbhârata (as Mr Muir has shewn in the fourth volume of his excellent work, *Original Sanscrit Texts*), Kr'ishn'a—which literally means, 'the black or dark one'—is sometimes represented as rendering homage to S'iva (q. v.), and therefore acknowledging his own inferiority to that deity, or as recommending the worship of Umâ (q. v.), the consort of S'iva, and as receiving boons from both these deities. In some passages, again, he bears merely the character of a hero endowed with extraordinary powers, and, in some, his divine nature is even disputed or denied by his adversaries, though they are ultimately punished for this unbelief. As the intimate ally of the Pân'du prince, Arjuna (see PÂN'DAVAS), he claims, especially in the philosophical episode, the Bhagavadgîtâ, the rank of the supreme deity; but there are other passages, again, in the Mahâbhârata, in which the same claim of S'iva is admitted, and an attempt is made at compromising their rival claims by declaring both deities one and the same. Sometimes, moreover, Kr'ishn'a is, in this epos, declared to represent merely a very small portion—'a portion of a portion,' as it is called—of the divine essence of Vishn'u. In the Mahâbhârata, therefore, which is silent also regarding many adventures in Kr'ishn'a's life, fully detailed in the Purân'as, the worship of V. in this incarnation was by no means so generally admitted or settled as it is in many Purân'as of the Vishn'uite sect; nor was there, at the epic period, that consistency in the conception of a Kr'ishn'a-Avatâra which is traceable in the later works.—The principal legends relating to Kr'ishn'a, as he appears in the Harivans'a and the Purân'as, are the following. A demon king, *Kansa* of Mathurâ, of the race of Yadu, and therefore of the lunar line of kings, who, in a former birth, had been the demon *Kâlanemi*, had deposed and imprisoned his father, *Ugrasena*, and oppressed with his iniquitous hosts, the Earth; and Earth having laid her complaints before an assembly of the gods on Mount Meru, Brahman prayed to V. to

relieve the world of its distress. When he had ended his prayer, V. plucked off two hairs, one white, and one black, and promised the gods that these two hairs should become impersonated as *Balarâma* and *Kr'ishn'a*, sons of Devakî, to fulfil their wishes. Now, Devakî, who, in a former life, had been Aditi (space personified), was a wife of Vasudeva, who was of the race of Yadu, and a relative of Kansa; but as Kansa had been warned by a voice in heaven that their eighth child would be an incarnation of V., he placed both husband and wife in confinement, after having obtained, though, from Vasudeva the promise that he would deliver to him every child Devakî would bring forth. Six children of hers were accordingly given up to Kansa, and destroyed; but when Balarâma, the seventh, was about to come into the world, V. appeared to *Yoganidrâ*, a form of Umâ (q. v.), and directed her to transfer Balarâma before the time of his birth to *Rohin'î*, another wife of Vasudeva, and spread the report that Devakî had miscarried; enjoining her also to become incarnate as a child of Yas'odâ, the wife of an old cowherd Nanda, at the same time that he would become incarnate, as Kr'ishn'a, in the eighth conception of Devakî; for at the time of their simultaneous birth, he added, Vasudeva, aided by him, would bring the infant Kr'ishn'a to the bed of Yas'odâ, and her to that of Devakî. In this manner, *Balarâma* and *Kr'ishn'a* were saved, though the infant Durgâ, as soon as born, was dashed by Kansa against a stone, and suffered a temporary death. Kansa having become aware that his design had been frustrated, now ordered the destruction of all young children wherever they might be found, but considering it useless to keep Devakî and Vasudeva any longer in prison, liberated them. Vasudeva, apprehensive of the safety of Balarâma, then took him to Nanda, to be brought up together with Kr'ishn'a; and thus began the earthly career of these two Avatâras of V., in which Balarâma always figures as the friend and ally of his more important brother, Kr'ishn'a. The first miraculous act of the latter consisted in causing the death of a female demon, *Putanâ*, who suckled, and meant to destroy, him. Then, as a little boy, he overturned a heavy wagon of the cowherds, and pulled down the trunks of two large trees—to the amazement of the cowherds, who did not yet suspect his divine nature, and becoming afraid to remain any longer in Vraja, the place where these events happened, repaired to Vr'indâvan'a. There Balarâma and Kr'ishn'a remained until they had attained seven years of age. At this time, Kr'ishn'a killed a serpent-monster Kâlîya, in the Yamunâ river, and then returned to Vraja. The next exploit of the brothers, more particularly however, of Balarâma, consisted in the destruction of two demons, *Dhenuka* and *Pralamba*, who infested the forests; but that which followed, especially established the fame of Kr'ishn'a, and is one still commemorated in their festivals by the worshippers of this god. When sporting in Vraja, he once found all the cowherds busily engaged in preparing for a sacrifice to be offered to Indra (q. v.). Seeing this, he dissuaded them from worshipping this god, and directed them to address their prayers and offerings to the mountain *Govardhana*. Indra, however, offended by these proceedings, sent a heavy storm, which inundated the country, and threatened to destroy the cattle. Thereupon, Kr'ishn'a plucked up the mountain Govardhana from its base, and held it up as a large umbrella over the cowpens, to shelter the herdsmen and their cattle from the storm. For seven days and nights they were thus protected by the elevation of the mountain; and Indra, at last convinced of the irresistible might of Kr'ishn'a, came to Govardhana, and worshipped him, obtaining on this occasion the promise that Kr'ishn'a would befriend the Pân'd'u prince, Arjuna, in his conflict with the Kurus (see MAHÂBHÂRATA). The episode in the life of Kr'ishn'a which now ensued, and is filled up with the pleasures and sports he enjoyed amongst the Gopîs, or cowherdesses, is that commemorated in the Râsa Yâtrâ, an annual festival celebrated in various parts of India in the month of Kârttika (October—November), and dwelt upon in many poetical works. Of these cowherdesses, later poets especially mention *Râdhâ*; and she is sometimes also represented as the divine or mystical love to which Kr'ishn'a returns at the end of his more worldly amours (see the article JAYADEVA). After some more miraculous deeds, Kr'ishn'a and Balarâma repaired to Mathurâ, where Kansa, in the hope of effecting their death, had invited them to assist at a solemn rite of the lustration of arms, and to engage in a trial of strength with his chief boxers, *Chân'ûra* and *Musht'ika*. *Akrûra*, sent by Kansa to convey to them his invitation, had already revealed to them the purpose for which he was despatched; but undaunted by his words, they accomplished their journey, during which they performed several other wonderful deeds, and, arrived at Mathurâ, accepted the challenge of Kansa. The contest ended not only in the death of the two boxers, but in that of Kansa also. Kr'ishn'a now released *Ugrasena*, Kansa's father, from the confinement in which he was kept, and restored him to the throne of Mathurâ. A number of other miraculous feats now followed in the career of Kr'ishn'a. The principal are his conquering *Jarâsandha*, the father-in-law of Kansa, who came to revenge the death of the latter, and *Kâlayavana*, a king of the Yavanas, who also overran Mathurâ with his armies; and his founding the city of Dwârakâ. At the end of these wars, he made a short stay at Vraja, then returned to Dwârakâ, and there married Revatî, by whom he had two sons. But he also carried off violently *Rukmin'î*, the daughter of a king of Vidarbha, who had been betrothed to *S'is'upâla* (q. v.), and had to wage a hot contest with the latter and his allies, before he conquered them. His next war was that with *Naraka*, a demon-king of Prâgjyotisha, who had robbed Aditi of her earrings, and ultimately was put to death by him. He then repaired to Indra's heaven, to restore to Aditi her earrings; but carrying off a wonderful tree from Indra's garden, got into a conflict with this god; ultimately, however, he was allowed by him to take the tree to Dwârakâ. There he married 16,100 maidens, whom he had rescued from Naraka. Other wars followed, in one of which Kr'ishn'a also fought with S'iva, when siding with his enemy Bân'a, who was a son of Bali. The most important, however, of all these contests is the great war between the Kurus and Pân'd'us, in which Kr'ishn'a was the ally of the latter. According to the *Vishn'u-Purân'a*, Kr'ishn'a's earthly career was brought to its close by an event which has nothing in it of the miraculous, and is more consistent with the end of a mortal hero than with that of an incarnate god. He was accidentally shot in the sole by a hunter, who thought that he was aiming at a deer. The hunter, it is true, is called *Jarâ*, which is a word in the feminine gender, and means 'old age,' or 'decay;' but even if a mere allegory, the story of his end 'from old age,' or an arrow, barely tallies with the character assigned him in the Purân'as, and is therefore sometimes also omitted in the accounts of this Avatâra.—For Balarâma, see also the legend in the article YAMUNÂ.

9. The *Buddha-Avatâra*, or V.'s epiphany as Buddha.—It is originally foreign to the cycle of the Avatâras of V., and therefore only briefly alluded to in some Purân'as. Where this is done

the intention must have been to effect a compromise between Brahmaism and Buddhism, by trying to represent the latter religion as not irreconcilably antagonistic to the former. See BUDDHISM.

10. The *Kalki-* or *Kalkin-Avatâra*.—It is yet to come, 'when the practices taught by the Vedas and the institutes of the law, shall have ceased, and the close of the Kali or present age shall be nigh.' V. will then be born 'in the family of *Vishn'uyas'as* (possessing the glory of Vishn'u), an eminent Brahman of Sambhala village, endowed with the eight superhuman faculties. He will then destroy all the barbarians and thieves, and all whose minds are devoted to iniquity.'—*Vishn'u-Purân'a.*

V.'s wife is *S'rî*, or *Lakshmî* (q. v.), and his paradise *Vaikunt'ha.* When represented, he is of a

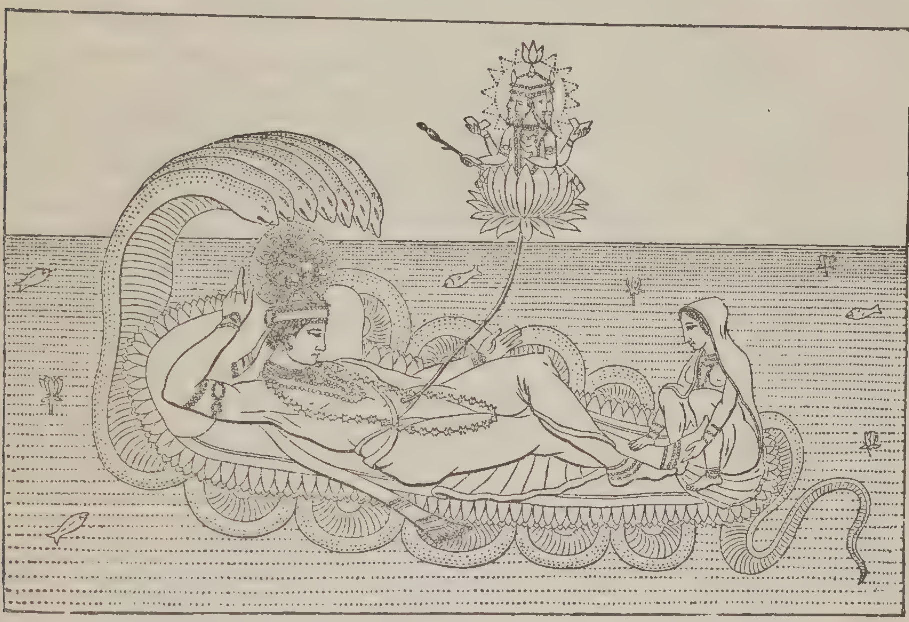


Fig. 2.—Vishn'u as Nârâyan'a.—From Moor's *Hindu Pantheon.*

dark hue, with four hands, in which he holds a conch-shell, blown in battle, the *Pânchajanya;* a disc, the *Sudars'ana,* an emblem of sovereign power; a mace, the *Kaumodakî,* as a symbol of punishment; and either a lotus, as a type of creative power, or a sword, the *Nandaka.* On his breast shines the jewel *Kaustubha.* He is variously represented: sometimes, as *Nârâyan'a** (see the first Avatâra), when floating on the primeval waters, and resting on *S'esha,* his serpent of infinity—the god Brahman coming out of a lotus that arises from his navel, and Lakshmî being seated at his feet; or riding on *Garud'a,* a being half bird and half man; or seated on a throne, and holding Lakshmî on his lap; or, if he is represented in one of his incarnate forms, as fish, boar, man-lion, &c., he has a human shape, ending in a fish, or a human body with a boar's head, or with a lion's head; or he appears as a dwarf, or (as Paras'urâma) armed with an axe; or (as Balarâma) holding a ploughshare. As Kr'ishn'a, he is generally represented either in a juvenile form, or as an adult, in a dancing posture, and playing on the flute. As Kalki, he has a sword in his hand, and is kneeling before a winged horse. The leading personages or events connected with these Avatâras are likewise frequently associated with the representation of the god: thus, in the representation of the fourth Avatâra, Hiran'yakas'ipu, as being torn open by the man-lion; or, in that of the sixth, the demon Arjuna, fighting with Paras'urâma; or, in that of the seventh, the ten-headed Râvan'a, battling with Râmachandra; or Hanumat and the monkey chiefs, paying adoration to the latter; while his brothers stand at his sides, and Sîtâ is sitting on his lap; or, in the eighth Avatâra, the mountain Govardhana, when uplifted by Kr'ishn'a, and the Gopîs sporting with him. V. is praised under thousand names, which are enumerated in the *Mahâbhârata,* and have been commented upon by S'ankara and other authors.—For other myths relating to V., the general reader may consult H. H. Wilson's translation of the *Vishn'u-Purân'a,* in the course of re-editing by Fitzedward Hall (vols. i., ii. already published Lond. 1864—1865); the first nine books of *le Bhâgavata-Purân'a,* traduit et publié par Eugène Burnouf, vols. i.—iii. (Paris, 1840—1847); *Harivans'a,* traduit par A. Langlois, vols. i., ii. (Paris, 1834—1835); Lassen's *Indische Alterthumskunde,* vol. i. (2d edition, Leipzig, 1866), vols. ii.—iv. (Bonn and Leipzig 1852—1861); and the first and fourth volumes of John Muir's *Original Sanscrit Texts* (Lond. 1858, 1863); see also the representations of V. in Edward Moor's *Hindu Pantheon* (Lond. 1810).

* 'The waters are called *nâra,* because they were the production of *nara* (or the supreme spirit); and since they were his first *ayana* (or place of rest, when in the form of the god Brahman), he thence is named *Nârâyan'a* (or resting on the waters).'—*Manu.* i. 10.

VISHN'U-PURÂN'A. See PURÂN'A.

VISIBLE SPEECH, a system of alphabetic

characters, each of which represents the configuration of the mouth which produces the sound of the letter. The system—the invention of Mr Melville Bell—is based on an exhaustive classification of the possible actions of the oral organs, each organ, and every mode of action, having its appropriate symbol. The radical symbols are combined into 'letters,' which thus yield a specific character for every variety of linguistic sound; even for those minutely differing shades which are not usually classed as separate elements, but considered only as accidental variations from the 'typical' or standard sounds of languages. In a comparison of languages, however, it will be found that no sounds are essentially typical, for the indefinite or accidental sounds of one tongue may be the standard sounds of another, and *vice versâ:* every distinguishable difference must therefore be included in a scheme of letters adapted for universal use.

In the experimental applications of visible speech, very striking results have been obtained, proving that words in any language, written in the new alphabet, suggest their exact utterance to readers who had never heard the words pronounced.

The types for the visible-speech alphabet not having been cast as yet, we are unable to shew the forms of the letters, and the mode in which they depict the oral configurations. Mr Bell has, however, given the most satisfactory proof of the reality of his discovery by submitting it to practical tests which leave no doubt of its completeness; and by exhibiting the symbols, and the theoretical details of their construction, to two or three competent witnesses. He has thus established the fact that, by means of not more than *thirty* radical symbols, every sound that can be formed by human organs may be physiologically written so as to insure a *fac-simile* pronunciation from all readers who are acquainted with the alphabet; and further, that the types formed from combinations of such radical symbols are as simple to the eye as common Roman letters.

The utility of this invention will obviously be very great, in enabling learners of foreign languages to master their pronunciation from books; in facilitating vernacular education in all countries; in the teaching of the deaf and dumb to speak; in international telegraphy; and in many other ways. Mr Bell points out that publication of his system under copyright would seriously interfere with its applications; and also that the scales of sounds should be orally exemplified to the first learners, so as to secure uniformity in the use of the symbols: and when it is considered that the latter are capable of representing some hundreds of elementary varieties, while the actually ascertained sounds of different languages exceed 100 in number, the importance of initiatory *vivâ voce* illustration will be apparent. The government has, therefore, been invited to undertake the typographic and oral inauguration of the system; and the inventor offers, in consideration of the public and international importance of the invention, to forego copyright in its publication under such circumstances. As yet, however, no member of the cabinet has been found willing to step beyond official routine for the investigation of the subject; and the proposal to make the use of the new alphabet as free as that of common letters has been addressed in vain to the various state-departments. Under these circumstances, the system will probably be published, eventually, as an ordinary copyright.

Meantime, we are enabled to present our readers with an outline of the scheme of symbols, although, for the reasons above stated, not with the symbols themselves:

ELEMENTARY SYMBOLS OF VISIBLE SPEECH.

1. Breath and Voice.
2. Emission, Suction, and Retention of Breath.
3. Guttural and Oral Contraction, in various degrees.
4. Guttural and Oral Closure.
5. Nasal Emission.
6. Parts of the Tongue, and of the Lips.
7. Parts of the Palate, &c.
8. Modes of Organic Action.
9. Consonant, Vowel, and Intermediate Modification.
10. Hiatus, Quantity, Accent, Tones, &c.

This list serves to shew the physiological character of the symbols, and the simplicity of the means adopted for the production of the demonstrated effects of visible speech. The correlation of the symbols is, however, the most important part; but this cannot be understood otherwise than from the symbols themselves, which are, by this means, self-explanatory of their sounds, as well as of the organic and mechanical relations which subsist between elements, or classes of sounds. Thus, the symbol for *p* indicates organic *closure* by the *lips;* and when this is learned, every letter which involves 'closure' by any part of the mouth is recognised at sight; the symbol for *b* denotes *closure* by the *lips*, accompanied by a murmur of *voice*, and when this is learned, every letter which is formed with 'voice' is discerned at once in any combination; and the symbol for *m* denotes *closure* by the *lips*, accompanied with *voice*, emitted through the *nose*, and when this is learned, every letter which involves a corresponding 'nasal' emission is identified without further explanation.

The total number of radical symbols is thirty; but not more than two-thirds of these are required in the writing of any European language. Perfectly illiterate persons in all countries will learn to read *their own language* from these symbols in a very few days, or hours; and when the symbols of known sounds are mastered, those for unknown sounds will, it is asserted, teach their own phonetic value, in most cases, with a close approximation to accuracy. Sir David Brewster, in his 'Report' on the invention, states that he has 'no doubt that it may be rendered intelligible by means of diagrams, aided by illustrations from the voice of a teacher;' consequently, that it may be taught to foreigners without the use of language as a medium of instruction.

The adoption of this system will not in any way interfere with existing alphabets. It is therefore free from the objections which have been made to 'phonetic' alterations of established 'spelling.' Visible speech will furnish a pronouncing key to the orthography of all languages, while it serves its own independent and totally new purposes as a dialectic and international alphabet, universally.

VI'SIGOTHS. See GOTHS.

VISION, the act of seeing; that faculty of the mind by means of which, through its appropriate material organ, the Eye (q. v.), we are percipient of the visible appearances of the external world. Considered in the latter signification, vision includes questions of high importance in relation to some of the most intricate problems of philosophy; but as this part of the subject has already been discussed under PERCEPTION, the present article will be restricted, as far as possible, to an exposition of the phenomena and laws of vision proper. In opposition to the bulk of mankind, who believe undoubtingly that they actually *see* the externality and

solidity of the bodies around them, Bishop Berkeley maintained that these properties are not the immediate objects of sight at all, but are simply ideas derived originally from the touch, and erroneously attributed to vision, in consequence of their having been uniformly experienced concurrently with certain 'visible signs' (as, for example, colour), with which alone the sense of sight is truly conversant; and this theory of vision having since received the adhesion of a great majority of the most able metaphysicians, it will be proper to give an outline of its leading propositions. In doing this, we shall at the same time intersperse such remarks and counter-statements as may appear to be rendered necessary by the progress of opinion and the results of modern experimental inquiry. As to the externality, or outness, of objects; or, which is the same thing, their distance from the eye. This, Berkeley maintains, cannot of itself and immediately be seen. 'For distance being a line directed end-wise to the eye, it projects only one point in the fund of the eye; which point remains invariably the same, whether the distance be longer or shorter.' To this position, everywhere assumed by Berkeley to be indisputable, and by his followers admitted to be so, it may be objected, that it contains an unwarranted assumption, viz., that a ray of light is, by its very nature, incompetent to convey an impression indicative of its possessing length or extension; or, to speak more accurately, it assumes that 'apparent distance' is not at all affected by a variation in the actual length of the ray intervening between the eye and the object. Yet it seems obvious, that the facts of vision do not admit of our arguing the matter, as though the line extending from any point of an object to the eye were a mere mathematical abstraction. Every visible point sends forth diverging rays, which form a cone whose base is on the pupil of the eye; and to the eye, the place of this visible point is at the intersection, real or virtual, of the rays in question: real, when the radiant point is viewed directly; virtual, when the rays, either by refraction or reflection, are diverted from their original path before reaching the eye. To take a case of refraction: if we notice the distance of a shilling lying at the bottom of an empty vessel, we shall observe, upon filling the latter with water, a manifest diminution in the apparent distance of the shilling, the reason being that the rays, on their emergence from the water, are bent outwards, so that the point of their virtual intersection is brought nearer to the eye. In reflection, the place of a visible point is, in like manner, referred to the point of virtual intersection of the cone of rays incident upon the pupil; and by multiplied reflections, the apparent distance of a point actually adjacent to the eye, may be increased to an almost indefinite degree. It is forcibly contended by Berkeley that these facts, involving, as they do, geometrical considerations known only to few, and by none consciously realised in the act of vision, cannot be concerned in our appreciation of distance by the visive faculty. Yet these, and numberless similar experiments, render it evident that both 'apparent distance' and 'apparent place' are closely dependent upon these geometrical conditions; and, therefore, without assuming that vision is performed by the aid of connate or instinctive geometry (a notion justly condemned by Berkeley), it yet seems highly probable that these lines and angles are the exponents and invariable concomitants of an actual operation of light upon the eye, specific in its character, and by reason of its necessarily varying, *pari passû*, with every change in the distance of the point of intersection of the visual rays, fitted to convey to us an intuitive perception of varying distance.

In the article EYE (q. v.), it has been shewn (as, indeed, necessarily follows from optical principles) that the eye does actually undergo specific modifications, depending for their amount on the distance of the object; and there therefore seems an intrinsic probability that these distantial variations in the organ of sight are correlated to those facts of our consciousness which we denominate variations of visible (not tangible) distance; and as, furthermore, it may be demonstrated by optical experiments that the 'apparent distance' of a visible point is directly modified, to our perception, by a simple change in the mutual inclination of its diverging rays, it seems an inevitable conclusion, that that agency of light which suggests to our minds differences of distance is competent to suggest distance itself.

Berkeley was quite aware of the necessary connection which subsists between the distance of an object and the divergency of the rays it emits, though it may be doubted whether he adequately weighed the importance of the train of consequences evoked within the eye itself by this variable divergency of incidence; but he affirms that the mind is not by these means helped to a conception of distance except in so far as by experience we have found that increased divergency, carried to the extent of producing 'confused vision,' is constantly associated with diminished distance. And in proof that this association is merely accidental, Berkeley cites a curious optical experiment, which shews that where the incident rays are caused slightly to converge, instead of their suggesting, as one would be led to expect, that the object is at an enormous distance, the result is altogether different; viz., at first, when the eye is close to the lens, and vision distinct, the object is seen at its true distance, but afterwards, as the eye is gradually withdrawn, and vision becomes continually more 'confused,' the object appears to be enlarged in all its dimensions, and to approach nearer and nearer, until it vanishes in mere confusion from the view. 'This phenomenon,' he says, 'entirely subverts the opinion of those who will have us judge of distance by lines and angles, on which supposition it is altogether inexplicable.' To which it may be replied, that the hypothesis being that the mind judges (mediately) by 'the various divergency of rays,' it cannot fairly be tested by experimenting with rays that are convergent, and that necessarily produce conditions of vision the reverse of those normally prevalent. But, besides, it is now certain that the explanation given by Berkeley is not the true one; for it has been shewn, by Professor Wheatstone, that when the dimensions of a retinal picture are continuously increased (as is the case in the above experiment), the object appears to approach in the most evident manner.

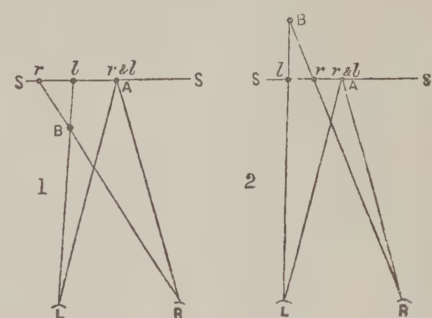
From the doctrine of Berkeley, that the sight is not immediately perceptive of distance, it necessarily follows that the parts of a solid object will not be seen as some of them more remote than others, but as if situated all in one and the same plane. This opinion has accordingly been maintained by more recent writers; yet its unsoundness seems manifest; for, if objects be originally seen, not as solid objects, but as perspective representations on a plane, then this plane must be seen either at no distance (which is absurd), or at the same distance for all objects (for which no reason and no evidence can be assigned); or at distances varying with the distances of the objects; but as the last two and only tenable suppositions assume the visual perception of distance, which is the very principle sought to be invalidated, the theory is thus shewn to be futile and self-contradictory. If it be admitted that, by the constitution of the organ

of sight in relation to light, we are perceptive of distance at all, it is in the highest degree probable, judging not only from analogy, but from the proved distantial affections of the eye, that we perceive by the sight degrees of distance; and a perception of the latter implies, it has been shewn, a perception of trinal dimensions. Now, although it is strenuously maintained by the adherents of Berkeley that this is not a primitive attribute of vision, it is not denied by any, that in the exercise of our mature sight, we do undoubtedly perceive the outness, the distance, and the trinal extension of visible objects; but, say they, these very qualities, not being modifications of light or colours, are only in appearance directly perceived by the eye; they are, in fact, the product of tactual experience, but by long and invariable association with the phenomena proper to sight, are now instantaneously suggested by them, in a manner so intimate that the two sets of perceptions have become, to our consciousness, indissolubly one. This, in effect, is to affirm that we cannot see an object to be possessed of trinal dimensions, until its occupancy of space is assured to us by the touch; whereas, we venture to maintain, that we see objects to occupy space, and that what we owe to experience is a knowledge that the major part of these visible appearances have, underlying them, that which, on our making a proper disposition of our bodies, will produce in us tactual sensations. We advisedly say the major part, because there are many objects in nature, such, for instance, as wreaths of smoke and vapour, which, though to the sight visibly possessed of trinal dimensions, are totally imperceptible to the touch. And this suggests the remark, that a great diversity of opinion has arisen out of the ambiguous meaning of the word 'solidity,' by which those who agree with Berkeley always signify, not mere occupancy of space, which, as we have shewn, may be associated with a total absence of tangible qualities, but 'resistant extension' in three dimensions, which, beyond all doubt, is solely cognisable by the touch. It is, of course, in the former sense alone that we vindicate to the sight an immediate perception of 'solidity;' and we do not use the term 'occupancy of space' at all in the sense of mechanical exclusion, an idea manifestly derived from touch, but only as affirming the immediately perceived trinal extension of visible objects. It may also be here remarked, that there are many substances of extreme hardness, and therefore in the highest degree perceptible to the touch, which, though set in a strong light, remain quite invisible; as, for example, the sheets of plate-glass used by Professor Pepper in producing his 'ghost-illusions.' Indeed, strictly speaking, all *perfectly* transparent substances, and all *perfectly* reflecting (polished) surfaces, are invisible. Again, there are many appearances in nature, into our perception of which there enters no element of tactual experience, even as it respects variety of surface (colour, of course, being excluded from this consideration); as, for example, the waves of the sea, spread out in long undulating lines, or breaking in foam upon the shore; and all those objects which, by their minuteness and the delicate diversifications of their shape and outline, elude the cognizance of the touch. These facts are adduced simply to illustrate the complete distinction and independence which subsists between the two sets of sensations, originating, respectively, with the sight and the touch—a point strongly enforced by Berkeley himself, who did not hesitate to affirm, not only that our habit of referring the two sets of sensations to the same objects is the mere effect of our having experienced them together, but that the two sets of ideas thus 'intromitted into the mind' belong, in fact, to two classes of objects, numerically distinct—the one outward, distant, and tangible; the other visible, but at no distance, and therefore, in reality, contained within the mind itself. But, as has been well pointed out by Mr Bailey, this very distinction, taken in conjunction with the undoubted fact, that we do in maturity apprehend by the sight the distance of visible objects, furnishes a strong presumption that those perceptions cannot have belonged originally to the touch. How little tactual sensations are able to modify visual perceptions is exemplified (as Mr Bailey remarks) by the fact, that 'a straight stick, with one end placed in a basin of water, would still appear to the sight to be bent at that end, after a thousand proofs by the touch that it was otherwise.' In the same way, the finger immersed in water appears 'unnaturally bent, though the experimenter feels it to be otherwise.'

The nature of 'visible' or 'apparent distance,' and how it compares with 'real distance,' we shall consider when we come to speak of apparent, as contrasted with real magnitude. But we will first inquire what are the optical conditions within the eye itself which determine our perception of the direction of a visible point. Every such point, as we have before remarked, radiates to the eye a cone of diverging rays, whose base is situated in the pupil of the eye; and these rays being refracted in their passage through the eye, are brought to a focus on the retina, thus forming another cone, the base of which is opposed to that of the incident cone, whilst its apex coincides with the focal point of the refracted rays. If the point of emission be placed directly before the eye, it will be seen in the direction of the common axis of these two cones; or, in other words, in the optic axis; and the point in which this axis bisects the common basis of the two cones is called the optical centre of the eye. Let us suppose, now, another visible point, a little above the first, but at an equal distance from the eye; this, too, will send forth to the eye diverging rays, which will, in like manner, be refracted to a focus upon the retina at a point a little below the preceding; and the line of visible direction will pass from the point of convergence on the retina through the optical centre. Now, it is evident that the rays, by means of which we see a visible point, come to the retina from all possible directions within the limits of the cones they collectively form. How comes it, then, that we perceive the object only in one determinate direction? The explanation usually given (founded on experiments in which a portion of the cone has been excluded without apparent change in the visible direction) is, that, by the constitution of the sense, upon any point in the retina receiving the apex of a cone of rays, we perceive the object in a right line extending from that point of the retina through the optical centre; or, according to others, in a right line perpendicular to the surface of the retina at that point. It will, however, be more consistent with the principle that the incidence of light is accompanied by a positive action, related to its direction as well as to its other properties, if we express the law of visible direction by saying, that upon a multitude of rays from all possible directions falling upon a retinal point, the perceived direction is the mean or resultant of them all; which is just as true an account of the phenomena, and amounts, we think, to something more than a verbal distinction. The optical facts we have thus, in brief, indicated, if followed out with respect to all the visible points forming the objects of sight, render it evident that inverted images of the latter are painted upon the retina; and the inquiry is prompted, how

these can give rise to erect vision. On reflection, it will be seen that an explanation of this old and much debated 'paradox of vision,' is involved in the preceding statement of the law of visible direction, in whichever way it may be expressed; and, as has been shewn by previous writers, the difficulty itself has arisen solely from the assumption, contrary to fact, that we see the retinal pictures, whereas, considered as images, they are not even the means, but only the concomitants of that operation of light by which we see. Even this important distinction, however, does not convey the whole truth; and we trust it will not be deemed an unnecessary refinement, if we point out that in a strict sense there is no *image* upon the retina, but only a concourse of rays, which, *to the eye of another person*, will undoubtedly give the perception of an image, but cannot be affirmed to exist, as an image, except in relation to this second observer. It is therefore with this reservation that the term retinal images is here made use of. As a consequence of all the lines of visible direction passing through the centre of the eye, it follows that as an object recedes from or approaches the eye, its retinal image becomes proportionally less, or greater; and, in like manner, the visible object itself varies in magnitude, under certain limitations, to be presently referred to, with every change in its distance. But as 'the magnitude of the object which exists without the mind, continues always invariably the same,' it is evident, argues Berkeley, that 'whenever we speak of the magnitude of anything, we must mean the tangible magnitude,' which alone is measurable by 'settled stated lengths.' The sense in which this is true, clearly illustrates the nature of magnitude and distance, as apprehended by the sight, in contradistinction to what is called real magnitude and real distance, the product of tactual experience. It must not be understood as imputing to the touch a superiority in mensurative capacity, but as simply meaning, that by the touch we come to know that the external world is endowed with resistant qualities—such as hardness, impenetrability, and incompressibility—qualities which we cannot conceive as modifiable by our bare visual perception of them; and from this experience accrues our conception of the reality and actuality of the magnitude and distance of objects, accompanied by a belief that the variability of magnitude and distance preceded by the sight is an appearance only, and dependent on conditions solely of a subjective kind. If this be a correct view, we are not forced to deny with Berkeley that the objects of sight are numerically the same as those we are cognizant of by the touch.

But we must now pass on to the concluding part of the subject—viz., 'single vision with two eyes;' in treating of which we shall have recourse, almost exclusively, to the masterly researches of Professor Wheatstone, of whose admirable discoveries in this department of knowledge we have already had occasion to speak in the article STEREOSCOPE (q. v.). It will be obvious to those who have read what is there stated, that the question of single vision with two eyes is naturally divisible into two classes—the first including those cases in which the optic axes are parallel, and the retinal images exactly alike; and the second, those in which the optic axes are convergent, and the retinal images dissimilar. Now, to see an object double is to see it in two different places at the same time; and therefore, if it can be shewn that by the law of visible direction an impression upon corresponding points of the two retinæ is necessarily referred to the same place, this will account for our single vision of the object at that spot. And, on consideration, it will be plain that this is really what happens when the optic axes are parallel, and the images identical. But it is also evident that this explanation does not apply to the second class of instances; in which the only visible point which depicts itself on corresponding portions of the two retinæ, is that point to which the optic axes are directed. All other points, whether situated before, beyond, or in the plane of the horopter,* are projected upon non-corresponding points of the retinæ; and as these conditions were presumed to be inconsistent with single vision, it was asserted by Aquilonius that objects are seen single only in the plane of the horopter (it has since, with greater consistency, been said, only at the point of intersection of the optic axes); but that this is not true is evinced by our common experience that, without movement of the optic axes, we enjoy a certain limited field of distinct vision. Its complete refutation, however, is involved in the theory of stereoscopic vision, which may be thus explained: Let the optic axis of the right eye (R) and of the left eye (L) be converged on the point A; suppose another point B, slightly to the left, and in advance of A; and then through the point B draw lines from L and R respectively intersecting the plane of the horopter in *r* and *l* (fig. 1). Now, if two diagrams, SS, be prepared (the one representing *l* and A, and the other *r* and A), and these be presented to their appropriate eyes in the stereoscope, with the view of each eye limited to its own picture; the points *r* and *l* will be seen as a *single*



point, situated not on the paper, but in advance of it, in the point of intersection of the lines of visible direction, indicated in the above construction by R*r* and L*l*. If the point B be supposed beyond A, and also to the left of it, the lines drawn from L and R to B will intersect the plane of the horopter in *l* and *r* (fig. 2); and stereoscopic pictures SS prepared under these converse conditions will exhibit the points *l* and *r* as a single point placed behind A at the point of intersection of the lines drawn from L and R respectively. This simple rule involves, as it seems to us, the true principle of the stereoscope; and it is capable of being applied to the most complicated stereoscopic pictures. For, in a stereogram, let *l* and *r* stand for identical parts of the left and right pictures respectively, and suppose the pictures superposed; those parts which, read off laterally from left to right, stand in the order *lr* will recede, and those in the order *rl* will protrude (relatively to those parts of the pictures in which *r* and *l* absolutely overlie each other), when the pictures are

* The horopter is a right line drawn through the point of intersection of the optic axes parallel with a line joining the centres of the eyes; a plane drawn through this right line at right angles to the plane of the optic axes, is called the plane of the horopter.

viewed together in the stereoscope. It appears, then, that vision of the third dimension of space is directly obtained by impressions on non-corresponding retinal points; the proof of this being given in the appearance of solidity experienced in the stereoscope, although perfectly plane representations are alone employed; but it would be an error to suppose that this non-correspondence is without a limit; and the question still remains, to what extent the retinal points affected may be non-correspondent, consistently with single binocular vision. Without attempting to propose any definite solution of this difficult question, it may, we think, be considered as highly probable that this limit is determined by the same law which regulates our distinct vision of objects by means of rays inexactly focussed on the retinæ; for, according to Mr Abbott, 'as long as the rays are contained within the area of one sensitive minimum, the sensation will be that corresponding to the vision of a point;' and 'a certain amount of dispersion does not interfere with distinct vision.' It seems certain that the double perception which is experienced of the farther of two objects, when the optic axes are fixed on the nearer, or *vice versâ*, can only arise when the object, thus doubled, is situated within the angle of the optic axes (whether before or beyond their intersection); for under these circumstances only, the sensitive points affected are not simply non-correspondent, but are utterly diverse, being in fact on different sides of the centres of the retina in the two eyes. That the law of projection of the various points composing the relief of a stereoscopic object is correctly stated above, is strongly corroborated by a curious experiment of Mr Wheatstone's, in which, solid objects are placed in the stereoscope, instead of pictures. As, for example, two skeleton cubes, so placed, that when the optic axes converge upon them, identical pictures are depicted on the retinæ; in which case, all appearance of relief vanishes, and a perfectly plane perspective representation of a single cube is alone visible; the reason being, that the lines of visible direction for each point intersect each other, neither before nor beyond, but *in* the plane of the horopter, where, accordingly, the object is seen as a perspective projection. The same rule holds when the right and left eye pictures are interchanged, for the pictures being supposed, as before, to overlie one another, the parts *lr* become now *rl*; that is, instead of having their point of intersection beyond the plane of the horopter, they have it before that plane; and this, *mutatis mutandis*, being true of all the parts of the pictures, the stereoscopic resultant is the converse of that which would be perceived but for this abnormal arrangement. In these phenomena, named by Mr Wheatstone the 'conversion of relief,' and copiously treated of by him in his various papers, the usual relations of distance also are reversed, the nearer parts being seen as farther, while the latter are perceived to be of larger dimensions than the former; and, the same principle being applied to the vision of solid objects by means of an instrument called the Pseudoscope (q. v. in SUPPLEMENT), also invented by Mr Wheatstone, they are seen as if turned inside out, and under divers other aspects of a most extraordinary character, some account of which will be found in the article just cited. But, as to many of them, it is proper to mention, that the facility of conversion is found to depend, not on the optical conditions, which, of course, remain invariable, but upon mental conditions, as, for instance, previous familiarity or otherwise with the converse forms suggested; in short, upon our previous *visual* experience.

We have not yet considered those cases in which the retinal pictures are identical, and the optic axes convergent. In these, the law is, that the object is seen in the plane of the horopter, as is conclusively proved by a beautiful experiment, suggested by Sir D. Brewster. If, while looking at a wall-paper, consisting of a small pattern, continually repeated at intervals not exceeding 2½ inches from centre to centre, we cause the eyes to converge to a point in front of the wall, the paper will appear to advance to that point, and will there be plainly visible, in spite of the contradiction of the touch, which, of course, cannot feel the wall where it is seen; while, on the other hand, the eye can perceive no wall in the place where the touch affirms it to exist. The converse of this experiment, although more difficult to perform, is equally curious and instructive. It has also been shewn by Mr Wheatstone, that if an increasing convergence of the eyes be unaccompanied by its usual concomitant, a corresponding enlargement of the retinal pictures, the object is seen as if continuously diminished in all its proportions, albeit the size of the retinal images remains unaltered. This experiment, which, with several others of almost equal interest and importance, may be performed by means of the stereoscope, figured on p. 115, vol. 9 of this work, also establishes that every degree of convergence of the optic axes is associated with the particular adaptation of the eye suited for distinct vision at that distance. This adaptation is, of course, directly dependent upon the divergency, less or greater, of the impinging rays, and this again stands in a necessary relation to the distance, real or virtual, of the point from which they diverge; a branch of the subject to which we have already given sufficient prominence. All observations and experiments concur in shewing that a part of the highest importance is played in vision, by the convergence of the optic axes, in particular, in so far as this is conjoined with a difference between the two retinal pictures; and, for this reason, it matters but little that we cannot, within our present limits, enter on a discussion of the evidence obtained from those persons, blind from birth, who have gained their sight by means of a surgical operation; for, in almost every case, only one eye at a time was operated upon, and the information then obtained from the patients, under circumstances of so much difficulty, is admitted on all hands to be of a very dubious and unsatisfactory character.

By mere modification of the light incident upon the eye, the same visible objects may be seen under infinite variations of figure, situation, and magnitude; while, at the same time, their real figure, real situation, and real magnitude, as apprehended by the touch, shall remain unaltered; but these phenomena, artificially induced, argue nothing against the general fact, that under normal circumstances we find, in the very place of the visible objects, those 'dynamical qualities' which form the sum-total of our tactual experiences. To Berkeley is due the credit of having first pointed out the original entire disconnection and subsequent intimate blending of the two sets of experience—visive and tactual; but, if the views here proposed be correct, he erred in supposing that our realisation of the geometrical proportions and relations of visible objects, is dependent on the suggestions of touch, and not upon the exercise of a primitive and inherent function of sight. To the popular view, the *objects of sight* have a positive and equal existence in absolute darkness, and are simply rendered visible by the light; whereas they are, in truth, the light itself variously modified. But, in conclusion, while fully admitting that light and its modifications, viz., colour in all its varieties,

form the sole objects of sight, we venture to maintain that we only know colour by our perception of it, as making up, by its superficial distribution, the visible form and shape of the objects of the outer world; and that this our perception of the shape, relative magnitude, and situation of visible objects is immediate, and strictly regulated by the laws of light in relation to the visual organ, irrespective of, and even in opposition to, tactual experience; but, at the same time, we hold that to the touch alone, we owe our belief, that these visible appearances are the signs of a materiality underlying them, in its nature unaltered and unalterable by our bare visual perception of them under aspects continually varying; and therefore, in all questions which relate to real size or real distance, we necessarily have recourse in thought to those qualities of matter which are apprehensible by the touch.

That an instinctive power of direct visual perception is possessed by the young of the lower species, is not denied by any; whether a like power has been bestowed upon man, we must now leave to the consideration of the philosophic reader.

See Berkeley's *Theory of Vision;* also his Vindication of that theory, a rare tract, republished, with valuable notes, by H. V. H. Cowell (1860); Wheatstone *On the Physiology of Vision*, Part I., in *Phil. Trans.* (1838); Part II., *idem* (1852); Review of Berkeley's *Theory of Vision*, by Samuel Bailey; review of the last-named work by J. S. Mill, in his Dissertations and Discussions; *Sight and Touch*, by T. K. Abbott; &c.

VISITA'TIONS, HERALDS', periodical circuits which were in use to be performed by the provincial kings-of-arms in England, in order to take cognizance of the arms, pedigrees, and marriages of the nobility and gentry. A visitation is said to have been held as early as the reign of Henry IV.; but the earliest visitation, in pursuance of a royal commission, was made by Thomas Benolti, Clarencieux, in 1528—1529, and comprehended the counties of Worcester, Berks, Oxford, Wilts, Gloucester, and Stafford. From that time, the visitations were repeated at periods varying from 25 to 30 years; never, however, extending to Wales, except on one occasion, in 1581. The latest commission was dated May 13, 1686, and under it some pedigrees were recorded as late as 1703—1704. The cessation of the visitations seems to have arisen from the frequent prohibitions granted by the Court of King's Bench to stay proceedings in the Earl Marshal's Court, and the abolition of the Constable as a permanent officer, in consequence of which the officers-of-arms found it difficult to enforce attendance. The records of the visitations, though not absolutely free from error, contain a mass of historical and genealogical information of great value. They form the principal source of evidence regarding the hereditary right to bear arms in England. The register-books have been scattered among various public and private libraries, including the British Museum (which possesses 312 visitation-books), the College-of-Arms in London, and the Bodleian Library. Some of them are no longer extant. A number of the visitations have lately been printed, and others are in the press. A catalogue of the visitations preserved in the British Museum was printed by Sir N. H. Nicolas in 1825; an index to the pedigrees and arms in about 250 of the principal MSS. there was published by Mr Sims in 1849; and an index to all the printed visitations by Mr George Marshall appeared in 1866.

In Scotland, there was no such regular system of visitations. A statute of James VI. (1592, c. 125) empowered Lyon King-of-Arms to visit the whole arms used within the realm; and visitations were undoubtedly made in pursuance of this act; but they seem to have been very partial, and no record of them is preserved. Something like a general visitation of Scotland again took place after the Restoration, under Act 1672, c. 21, the statute instituting the armorial register in the Lyon Office, which record was constituted the sole legal evidence of a right to bear arms, and has been continued to the present day.

VISITOR, in the Law of England, is one who has a right to inspect the internal government of a corporation or charity. Thus, the ordinary, who is generally the bishop, is the visitor of spiritual corporations. Corporations instituted for private charity and lay foundations are visitable by the founder, or his heirs, or his nominees.

VISOR, or **VIZOR**, otherwise called BEAUVOIR or BEAVER, the part of the helmet of the middle ages which protected the face. It was perforated to admit light, and movable, so that it could be raised or put down at pleasure. According to the rules established in the later heraldry, the helmet of a knight, when placed over his shield of arms, has the visor up, while that of an esquire has the visor down.

VI'STULA (Lat. *Vistula* or *Visula*, Ger. *Weichsel*, Russ. *Wisla*), an important river of Austria, Poland, and Prussia, rises in Austrian Silesia, near the frontier of Galicia, in a morass in the Jablunka Mountains, 15 miles south-east of Teschen (q. v.), and at the height of 2000 feet above sea-level. Formed by three head-waters, the White, the Little, and the Black Vistulas, the V. flows north-west a few miles to the village of Weichsel, where its course is marked by a fall of 180 feet, and thence to the town of Schwarzwasser, where it leaves the mountains. At this point, the V. turns north-east, and flows in this direction past Cracow, to its confluence with the San, 10 miles below Sandomierz, forming throughout nearly the whole of this part of its course the boundary between Galicia and Poland. From its confluence with the San, the river turns to the north, enters Poland, which it traverses in a general north-west direction, passing Lublin, Warsaw, and Lipno. Leaving Poland, it enters the kingdom of Prussia, flowing west-north-west to its junction with the Bomberger Canal; thence north-north-east, past Kulm and Schwetz, to Graudenz, where it turns north, and flows in that direction to its embouchure in the Baltic Sea, which it enters by several mouths. About 10 miles below Marienwerder, it throws off an arm called the Nogat, which, taking a north-east direction, and after flowing 32 miles, enters the Frische Haff by about 20 mouths. The main stream continues to flow north for 115 miles, dividing, however, into two branches, one of which flows into the Frische Haff, the other into the Gulf of Danzig at Weichselmunde, 3 miles below Danzig. The V. receives from the right the Bug, the San, the Dunajec, and the Wieprz; from the left, the Pilza and Brahe. The V. is 616 miles in entire length. It becomes navigable at Cracow for small vessels, and for large vessels at the confluence of the San.

VIS VIVA. See WORK.

VISWÂMITRA is one of the most interesting personages in the ancient history of India. According to the Aitarêya Brâhman'a (see VEDA), his father was *Gâthin;* and in a remoter degree, V. derived his pedigree from the king *Purûravas* (q. v.), who was an ancestor of Kus'ika. In the Mahâbhârata, Râmâyan'a, and the Purân'as, his father is called *Gâdhi*, and the origin of the latter likewise traced up to Purûravas; but the distance

between the two latter personages is differently filled up in the genealogies given by some of these works. As, according to several accounts, V.'s sister was *Satyavatî*, who married *Richîka*, and bore to him *Jamadagni*, he was the maternal grand-uncle of *Paras'urâma* (see VISHN'U, the sixth Avatâra). He had 100 sons, 50 of whom were, for an offence they committed, degraded by him to become outcasts, and the progenitors of the Andhras, Pun'd'ras, S'abaras, Pulindas, Mût'ibas, and other frontier tribes, which in the Vedas are called Dasyus, or robbers. V. is the author of many hymns of the R'igveda (see VEDA), especially of its third, Man'dala; but his fame, which pervades all the periods of Sanscrit literature, is chiefly founded on the remarkable fact, that though by birth a Kshattriya, or a man of the military caste—he is also described as a Ra'ja of Canouj—he succeeded in having himself admitted into the Brâhmanic caste, after a long contest, which, for this end, he had to wage with the R'ishi *Vasisht'ha* (q. v.). That the result of this contest was the elevation of V. to the rank of a Brâhman'a, is the account given in the epic poems and the Purân'as; but as the rivalry between V. and Vasisht'ha is already alluded to in several passages of the R'igveda hymns, and as at their time the caste distinction of later periods of Hinduism was not yet established, it is probable that the later traditions relating to this contest rested on the circumstance, that *Sudâs*, a king named in the R'igveda, who, as is there stated, employed Vasisht'ha for his house-priest, allowed, for some unknown reason, also V. to officiate for him at sacrifices, and that the latter, incurring on this ground the jealousy of Vasisht'ha, had to maintain, probably by force, the prerogative conferred on him by his royal master. In the epic poems and the Purân'as, the rivalry between these two personages is the subject of several legends, which, considering the relative age of the kings referred to in them, would encompass a period far exceeding that of the lifetime of a human being. A kind of consecutive biography of V. is given in the first book of the Râmâyan'a, of which it forms one of the most interesting episodes. Its substance is as follows: Once, when roaming over the earth with his armies, V. came to the hermitage of Vasisht'ha, and was there received by the saint in the most sumptuous style. Vasisht'ha could afford to entertain the king in this manner, because he possessed a fabulous cow of plenty that yielded him everything he desired. V., becoming aware of the source of Vasisht'ha's wealth, strongly wished to possess the cow, and asked Vasisht'ha to sell her to him. The saint, however, refusing this offer, the king seized her, intending to carry her off by force. But the cow resisted, and ultimately displayed her supernatural powers in producing from different parts of her body numerous peoples, and by their aid destroying the armies of Vis'wâmitra. The king then had recourse to the magical weapons he possessed, but they were defeated by those of Vasisht'ha; and to the humiliation thus inflicted on him he then gave vent in exclaiming: 'Contemptible is the might of a Kshattriya; a Brâhman's might alone is might.' And reflecting on what he should do in this emergency, he resolved to practise austerities in order to attain the rank of a Brâhman. In consequence, he went to the south, and performed severe penance during a thousand years; when, at the end of this period, the god Brahman appeared, and announced to him that he had become a Râjarshi, or royal R'ishi. But V., not satisfied with this degree of holiness, continued his austerities for another such period. During that time, a king, *Tris'anku* of Ayodhyâ (Oudh), of the family of *Ikshwâku*, had conceived the design of performing a sacrifice, that he might bodily ascend to heaven, and solicited for this purpose the assistance of Vasisht'ha, who was the family priest of 'all the Ikshwâkus.' This saint, however, having declared the scheme of the king impossible, and his sons, too, to whom the king likewise addressed himself, having refused compliance with his wishes, he told them that he would resort to another priest, and was, in consequence, cursed by them to become a man of the lowest caste. In this condition, he went to V.; and the latter shewed his power by performing the sacrifice, so much desired by Tris'anku, and accomplishing his object, in spite of the resistance of Vasisht'ha and his sons, and that of the gods themselves. (The *Harivans'a* relates this story with somewhat different detail, but brings it to the same issue. According to the Vishn'u-Purân'a, which alludes to the version mentioned in the last-named work, Tris'anku was the 28th in descent from Ikshwâku; but in the Râmâyan'a, there are only five kings between Ikshwâku and Tris'anku.) This event having caused a serious interruption in the austerities of V., he proceeded to the forest *Pushkara*, in the west, to remain undisturbed. But while he resided there, it so happened that *Ambarîsha*, another king of Ayodhyâ, intending to perform an expiatory sacrifice, and requiring a human victim for this purpose, after a long search, had bought for immolation from the Brâhman *Richîka*, the brother-in-law of V., his son *S'unahs'epha*, and was bringing him home to his capital. On his journey, he halted in the forest Pushkara, and when S'unahs'epha there saw his uncle V., he implored him to come to his rescue. V. first directed 50 of his sons to offer themselves up as a ransom for their cousin, and, on their refusing to do so, cursed them to become outcasts; but afterwards taught S'unahs'epha two hymns, which, as he said, if sung by him at the sacrifice, would save his life. (In the genealogy of the Râmâyan'a, there are 21 kings between Tris'anku and Ambarîsha; in that of the Vishn'u-Purân'a, 15 kings; and in the former, between Ikshwâku and Ambarîsha, 27; and in the latter, between Ikshwâku and Ambarîsha, the *successor of Tris'anku*, 43 kings.) The liberation of S'unahs'epha having been effected, and V. having continued his penance for another thousand years, the god Brahman conferred on him the dignity of a *R'ishi*. But not yet satisfied with this distinction, he went on practising still fiercer austerities than those he had practised before. These the gods succeeded in depriving for a time of their spiritual efficacy, by sending him a heavenly nymph, *Menakâ*, who excited his worldly passions; still, in the end, he attained the rank of a *Maharshi*, or great R'ishi. And, after two other thousand years of still more rigorous penance, which for a time was again interrupted by the allurements of a nymph, Rambhâ, whom the gods had sent for the same purpose as previously Menakâ, the gods, headed by Brahman, came to acknowledge that he had now become a Brahmarshi, or Brâhman'ic R'ishi; and Vasisht'ha himself was compelled to express acquiescence in the result he had achieved. For other legends relating to this contest between V. and Vasisht'ha, see vol. i. of John Muir's *Original Sanscrit Texts* (Lond. 1858); and the article HARIS'CHANDRA. Compare also VISHN'U, the 7th Avatâra.—The name of V. is explained in the Mârkan'd'eya-Purân'a as representing a compound, *vis'wa*, 'all,' and *amitra*, 'no-friend,' and meaning, 'one who is no-friend of all, *scil.*, the three worlds.' The Mahâbhârata, however, explains it as *vis'wa*, with its final vowel lengthened, and *mitra*, friend, when it would imply that V. was

'the friend of all, *scil.*, the gods;' and *Yâska*, the oldest writer who gives an etymology of this name, likewise renders it 'friend of all.' The former etymology would seem the more regular; but as in Vedic *inseparable* compounds the final vowel of the first part is frequently lengthened, the latter etymology is the preferable of the two.

VITA'CEÆ, also called SARMENTACEÆ and AMPELIDEÆ, a natural order of exogenous plants, of which the common vine may be regarded as the type. About 260 species are known, natives of warm and temperate climates, all shrubs, mostly climbing; with simple or compound leaves, with or without stipules, the lower leaves opposite, the upper ones alternate; the flower-stalks racemose, opposite to the leaves, sometimes (as in the vine), by abortion, changing into tendrils.—The only plant of the order of much value, in an economical point of view, is the Vine (q. v.), nor are there any fine fruits except its fruit (the grape); and that of species so closely allied to it as to be not improbably mere varieties; but species of the genus *Cissus* and of *Ampelopsis* (which many unite with *Cissus*) are sometimes planted for ornament. *Cissus antarctica* is the KANGAROO VINE of New Holland; and *Ampelopsis quinquefolia*, often called the VIRGINIAN CREEPER, is a frequent ornament of the fronts of houses in Britain and America, attaching itself to the wall by tendrils terminating in a peculiar kind of sucker, and climbing to a great height.
